India, resinous products of . . .	223, 282, 302
Inscription, Bactrian-Pali, in the Lahore Museum . . .	121
Phoenician, found at Byblos . . .	146
Greek, found at Hissarlik . . .	147
the Eshmunazar . . .	248
Assyrian, in the Vatican museum . . .	616
Insects, hymenopterous, from the neighbourhood of Calcutta . . .	71
relations of English wild flowers to . . .	121
captured in Kerguelen's Island . . .	666
Intonation, just and tempered . . .	640
Iron and Steel, changes produced in, by hydrogen and acids . . .	664
Isfahan and the district of Chonsar, geology of . . .	20
Italy, Southern, earthquake-phenomena of Jacotegryden, or Glants' Cauldrons, in Norway . . .	589
Jahrbücher of the theological faculty at Jena . . .	147
Java, the inhabitants of . . .	616
Julian, Emperor, a letter of . . .	357
Jupiter's satellites, shadows of . . .	70
Just's (Dr.) <i>Botanischer Jahresbericht</i> . . .	328
Kalisch's (Dr.) <i>Hebrew Grammar, with Exercises</i> . . .	510
Kangaroos, lecture by Prof. Miwart on . . .	666
Karaites tombstone, supposed, in British Museum . . .	302
Kaukasus, Abich's journeys in the Kerguelen's Land, plants and insects of 178, cabbage . . .	223
Kew, the botanical collections at . . .	484
Kimmeridge clay of England, the Klusmann's (R.) <i>Emendationes Prononiamas</i> . . .	197
Koppite, a new mineral from the Kaiserstuhl . . .	248
Language and Race, Rev. A. H. Sayce on <i>Laopithecus robustus</i> . . .	358
La Plata, flora of . . .	561
Larva found in <i>Andrena Trimmerana</i> . . .	666
Lateau, Louise, the ecstase . . .	146
Lead compounds, electric conductivity of Lecythidaceae, genera and species of the <i>Lenuraura</i> , new species of quadrumana . . .	356
<i>Lepisma</i> , living specimens of a . . .	302
Leucocytes, part taken by the nucleus, in the division of . . .	405
Lias of Radstock, the . . .	590
Libyan desert, plants of the . . .	71
Light, the velocity of . . .	70, 512, 536
the zodiacal . . .	301
Lightning conductors, Dr. R. J. Mann on . . .	562
Lilium, the genus, monograph of . . .	95
Lion house in the Zoological Gardens . . .	561
Liquids, the thermal conductivity of . . .	222
ebullition of . . .	432
phenomena produced in, by electric currents . . .	664
"Listening Slave, the, and Slaying of Maryas," paper on . . .	357
Long-Barrow Period, people of the . . .	408
Long, Col., visit of, to Mtssa, King of Mganda . . .	96
Longevity . . .	301
ultra-centenarian . . .	302
Lubbock, Sir John, on English wild flowers and insects . . .	121
Lyell, Sir C., bequest of, for geological research . . .	356
Madagascar, Central Provinces of . . .	147
the people of . . .	485
Magnet, position of the poles of a . . .	665
Magnetisation of steel, studies on the 222, 327 . . .	
Mallet, Mr. R., on the volcanic phenomena of Stromboli . . .	20
Malusius of Gargara, decree in favour of 147 . . .	
Mammoth Cave, fishes and cray fish from 509 . . .	
Man, the antiquity of . . .	431
Mantis, specimen of a, from Sarawak . . .	71
Manuscripts, the classification of . . .	172
Manx language, paper on, by Dr. Murray . . .	667
Marion, M., on a nemertian worm . . .	484
Marmot, effect of hibernation on organs of the . . .	69
Mastodon's stomach, contents of . . .	615
"Matutinitätseignisse," Herr Rieck on . . .	562
Mätzner's Grammar, translation of . . .	381
Medals of the Geological Society . . .	145, 226
naval, of Cromwell . . .	226
Melbourne observatory . . .	70
"Membrana nuclei" in the seeds of <i>Cycads</i> . . .	275
Memory, the psychology of . . .	580
Mercury, the thermal conductivity of . . .	222
Meru, Mount, and the Homeric Olympus . . .	459
Metallic solutions, spectra of . . .	120
chlorides, electrolysis of solutions of . . .	120
sulphides, electric conductivity of . . .	223
Meteorological returns for the United Kingdom . . .	145
observations for travellers . . .	587
Meteorology . . .	19, 148, 246, 355, 457, 587
marine, in Germany . . .	19
geographical, progress of . . .	246
arctic . . .	247

NOTES—continued.

	PAGE
Meteorology, maritime, Conference for . . .	355
international . . .	457
Metors, the November . . .	71, 406
Metreology, ancient, Mr. Oonder on . . .	616
Michel Angelo, portrait of, by Leone Aretino . . .	275
Micro-fungi, the forms assumed by . . .	71
Microscopical notes . . .	274, 406, 484, 615
Microspectroscope, the use of . . .	408
Midland <i>patois</i> , the . . .	329
Milanows of Borneo, the, paper by Lieut. de Crespigny on . . .	248
Mimoseae, the, sub-order, Mr. Bentham's revision of . . .	328
Mind, duality of the . . .	641
Miocene beds of the Walgat Strait . . .	145
Mistletoe, occurrence of, on the common oak . . .	228
Moh'n's (Prof.) handbook <i>Wind and Weather</i> . . .	458
Molecular constitution of bodies, dynamical evidence of . . .	225
Mollusca found near Pernambuco . . .	356
Monads found in a maceration of ood's head . . .	406
Monkey, lower jaw of, found in Miocene rocks . . .	356
Moods, the subjunctive and optative, Prof. Sewell on . . .	45
Mossel Bay, winter life of algae in . . .	406
Moth, the December, remarks on . . .	71
Motor centres in the cerebral convolutions . . .	406
Mountain-climbing, temperature of human body during . . .	483
Mouth-organ pipes, the theory of . . .	119
Mtssa, visit of Col. Long to . . .	96
Murchisonite beds of the estuary of the Ex . . .	248
Muscle, voluntary, excitation in . . .	273
unstriated, effect of electricity on . . .	483
Musical nomenclature, Mr. Hullah on . . .	249
notation, Dr. Stainer on . . .	407
<i>Myodus lemmus</i> and <i>torquatus</i> , fossils of . . .	356
Mythology, Mr. M. D. Conway on . . .	537
Namaqualand, collection of plants from . . .	380
Nastoesen, King, stèle of . . .	72
Navigation, early modes of, paper by Col. Lane Fox on . . .	45
Nebulae, 500, catalogue of . . .	197
the extended . . .	302
Nematodes, parasitic, Dr. Lewis on . . .	484
Nematoids, marine, peripheral nervous system of . . .	274
Nerve-fibres in the optic chiasma, decussation of . . .	170
glossopharyngeal, vaso-dilator action of . . .	405
Newfoundland, stone implements of . . .	589
New Guinea, natives of . . .	481
Niagara Falls, excavation of the gorge of . . .	459
Nomenclature, musical, Mr. Hullah on . . .	249
Nothnagel on the localisation of function in the brain . . .	69
Noumea, French expedition to . . .	689
Numismatics, Jewish, paper by Mr. Madden on . . .	225
Oak-galls, the pathology of . . .	121
Optic chiasma, decussation of nerve-fibres in the . . .	170
Orbital movement of 61 Cygni . . .	197
Organ, string, Mr. Baillie Hamilton's . . .	222
Ornithological works . . .	560
Ornithoptera, of the Malabar coast . . .	432
Orphichl 70, orbit of . . .	301
Oxygen, proportion of, in the air . . .	356
effect of, on temperature and circulation . . .	405
Oxytropis, Dr. Bunge's monograph of the species of . . .	328
<i>Palola viridis</i> , marine worm . . .	667
Panceri, M., on Polynoe (sea-annelids) . . .	380
Pandaneae, or screw-pines, from the Seychelles and Mauritius . . .	380
Paradoxes in language, paper by Mr. Fowler on . . .	45
Pasteur's theories of fermentation . . .	406
<i>Peronospora arborescens</i> . . .	274
Peru, pre-historic, anthropology of . . .	97
Petrarch collection at Trieste . . .	616
<i>φιλανθρωπία</i> , idea embodied in the word . . .	45
Phillips' (Prof.) <i>Geology of Yorkshire</i> , new edition of . . .	247
Philological Association, American, report of session of . . .	45
Philology . . .	610
Phoenician characters still in use at Sumatra . . .	45
Phosphates, occurrence of, in the Cambrian rocks . . .	381
<i>Phylca arborea</i> , discovery of, in Amsterdam Island . . .	223
Phylloidy, development of, in <i>Alitaria officinalis</i> . . .	484
Phyllotaxis, origin and prevailing systems of . . .	173
Phylloxera, remedies for . . .	485
Physics . . .	119, 292, 397, 431, 664
Physiology . . .	69, 170, 278, 405, 483, 614
Planetary tables . . .	70
Plant life, Mr. W. S. Clark on the Phenomena of . . .	509
Plants, vital phenomena common to animals and . . .	44

NOTES—continued.

	PAGE
Plants of the Libyan desert . . .	71
of the mallow family . . .	71
two new species discovered in Aberdeenshire . . .	96
ant-supporting . . .	197
bleached, yellow colouring-matter of . . .	228
carnivorous . . .	328, 509
dried, from China . . .	483
Polariscope, revolving . . .	589, 665
Pollen grains, Mr. A. Bennett on . . .	484
Polynoe, the light emitted from . . .	380
Polyzos, new genus of . . .	146
Pomaceae, the . . .	581
Portraiture, the real and ideal in . . .	329
Potato beetle, the . . .	482
disease, the . . .	665
Pottery from excavations in Giltspur Street, London . . .	97
Pressure, atmospherical, measurement of . . .	246
wind, and rain, distribution of . . .	246
Prestwich, Prof., on the Past and Future of Geology . . .	556
<i>Pringlea antiscorbutica</i> , discovery of, in Marion Island . . .	223
Proportion, theory of the treatment of . . .	72
Proverbs, Eastern, paper by Rev. J. Long on . . .	324
Psychological Institute . . .	431
Pterodactyls, or flying reptiles . . .	146
Quadrant electrometer . . .	664
Quadrumania, Eocene and Miocene, new forms of . . .	356
Radiation, solar . . .	19, 247
Radiometer, description of the . . .	536
Rainfall, effect of, on barometrical pressure . . .	19, 145
Ronde, Mr. T. M., on the effects of tidal action . . .	20
Reading, geology of the neighbourhood of . . .	248
Recruits for the army, chest-measurement of . . .	381
"Red-rot," the, of pines . . .	223
Refraction of the atmosphere of Venus . . .	302
Refraction bodies, minute, invisibility of . . .	374
Reichenbach's (Dr.) <i>Xenia Orchidaceae</i> . . .	228
Resinous products of India . . .	323
Rethine, contest between the . . .	171
Rhacotis beds, section of, near Nottingham . . .	458
Rhinoceroses, horned, found in America . . .	356
Rhythm, English, Prof. Mayor on . . .	178
Ribbot, M., on the measurement of sensation . . .	379
"Richard III.," the corrected edition of . . .	408
Ring with Runic inscription, Major Mac Donald's . . .	303
Rivers, alterations in the level of . . .	458
Rome, discoveries elucidating the topography of . . .	178
Roots in language, theory of . . .	512
Rotifers, discovery of males of . . .	274
Rumination, mechanism of . . .	614
Sacrifice, human, among the Babylonians . . .	172
Saka coinage, specimen of the . . .	71
<i>Salamandrella petrolei</i> , new amphibians . . .	356
Samaritans, history, dogma, and literature of the . . .	380
Sandstone, columnar, of the Island of Bute . . .	247
Sanskrit text, the first printed at Leyden . . .	146
<i>Saxifraga tridactylites</i> . . .	509
Scrophularineae from Alexandria and Abyssinia . . .	223
Seal and mace, ancient, of the corporation of Athery . . .	483
Seeds, germination of, influence of certain compounds on . . .	614
Seewarte, the Deutsche . . .	247
Senegal, climate of . . .	356
Sensation, problem of obtaining a measure of . . .	379
Seti I., tomb of, at Thebes . . .	302
Settle Caves, exploration of the . . .	589
Seychelles and Mauritius, the screw-pines of . . .	380
Shakespeare's plots, the originals of . . .	642
Shark, spiny, cranial nerves of . . .	581
Sigiri, the ruins of . . .	459
Signal Office (Washington) Report of . . .	588
Sign of foetal animals, influence of season on . . .	614
Slack, Mr., on microscopic eye-pieces . . .	484
Slavonia, lignite and brown-coal deposits of . . .	20
Sledge travelling, arctic . . .	667
Sleep and dreams, phenomena of . . .	537
Slides, microscopic, Dr. Wallich's collection of . . .	615
Soap bubbles, gas diffusion through the walls of . . .	171
Sodium, projection of a pure spectrum of . . .	249
Solar radiation . . .	19, 247
— eclipse of April, 1874 . . .	72, 301
— prominences and spots . . .	640
Somerset, West, dialect of . . .	97
Spectroscopic observations . . .	535
Spectrum photographs . . .	432
of the aurora . . .	432
Spitzbergen, paper by Dr. von Drasche on the geology of . . .	20
— fossils from the south of . . .	20
Spleen, changes in the blood during its passage through the . . .	171

NOTES—continued.

	PAGE
<i>Stagonolepis Robertsoni</i> . . .	460
Stapellias and allied plants, from Namaqualand . . .	289
Star, new variable . . .	302
Stars, red, catalogue of . . .	485
— spectra of . . .	404
— measures of magnitudes of . . .	642
Steel, studies on the magnetisation of . . .	222, 377
— superposition of magnetic layers in . . .	664
Stèle of King Horsiaten . . .	71
— Nastoesen . . .	72
Stone Age of Egypt, the . . .	20
— mining tools, discovery of, at Alderley Edge . . .	301
Stratification in electrical discharges through rarefied gases . . .	641
Stromboli, the volcanic phenomena of . . .	20
Stylops, male specimens of . . .	521
Sub-Wealden Exploration Committee, borings by . . .	96, 248, 407, 539
Suction, the mechanism of . . .	406
Sun spots in 1874 . . .	302
— temperature of the . . .	406
— structure of the . . .	406
— temperature of the surface of . . .	333
— parallax of the . . .	533
— diameter of the . . .	647
Sundevall, Swedish zoologist, death of . . .	242
Surface-soil, characters of the . . .	254
Tables of Venus, accuracy of the . . .	70
— planetary . . .	79
Tablets, astronomical, early Babylonian . . .	407
Talamanca, exploration of the district of . . .	356
Tanganika, Lake, Lieut. Cameron's examination of . . .	276
Targum dialect of the Jews of Media and Assyria . . .	511
Temples, Egyptian and Nubian, views of . . .	616
Temperament, or the division of the octave . . .	510
Temperature, distribution of, in an ascending current of air . . .	19
— effect of oxygen on . . .	405
— on the coasts of the British Islands . . .	460
Terias, Hecabe group of the . . .	327
Thelids, fossils from the pleistocene beds of . . .	354
Thermal conductivity of liquids, the . . .	223
— mercury . . .	222
Thermometers, low range, errors of . . .	460
Tibet, travels in and trade through . . .	460
Tidal action, effects of, viewed as a geological cause . . .	20
Torpedo, immunity of the, from effects of its own shock . . .	463
<i>Trachylobium Hornemannianum</i> . . .	223
Tree-aloos of South Africa . . .	43
Urchau, the destruction of remains in the . . .	380

SATURDAY, JANUARY 2, 1875.

No. 139, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Works of Edgar Allan Poe. Edited by John H. Ingram. Vols. I. and II., containing the Collected Tales. (London and Edinburgh: Adam & Charles Black, 1874.)

WITH just so much of the author's works before us, it would be too soon to speak definitively of his character, either as a man or a writer; and hence, although Mr. Ingram's memoir is prefixed, duly enough, to the first volume, I do not think it falls to be considered here in any detail. Mr. Ingram has done his best to clear Poe's name from the calumnies of Rufus Griswold (a gentleman, grim by name, who makes so repulsive a figure in literary history, that he might well have been coined in the morbid fancy of his victim); but when all is said, it is not in the power of man to make Poe altogether sympathetic. I cannot find it in my heart to like either his portrait or his character; and though it is possible that we see him more or less refracted through the strange medium of his works, yet I do fancy that we can detect, alike in these, in his portrait, and in the facts of his life as now most favourably told, a certain jarring note, a taint of something that we do not care to dwell upon or find a name for.

The tales themselves are all before us in these two volumes; and though Mr. Ingram does not tell us whether they are there printed in chronological order, I fancy we shall not be mistaken in regarding some of the last stories in the second volume, as being also among the last he wrote. There is no trace, in these, of the brilliant and often solid workmanship of his better moments. The stories are ill-conceived and written carelessly. There is much laughter; but it is a very ghastly sort of laughter at best—the laughter of those, in his own words, “who laugh, but smile no more.” He seems to have lost respect for himself, for his art, and for his audience. When he dealt before with horrible images, he dealt with them for some definite enough creative purpose, and with a certain measure and gravity suitable to the occasion; but he scatters them abroad in these last tales with an indescribable and sickening levity, with something of the ghoul or the furious lunatic that surpasses what one had imagined to oneself of Hell. There is a duty to the living more important than any charity to the dead; and it would be criminal in the reviewer to spare one harsh word in the expression of his own loathing and horror,

lest, by its absence, another victim should be permitted to soil himself with the perusal of the infamous “King Pest.” He who could write “King Pest” had ceased to be a human being. For his own sake, and out of an infinite compassion for so lost a spirit, one is glad to think of him as dead. But if it is pity that we feel towards Poe, it is certainly not pity that inspires us as we think of Baudelaire, who could sit down in cold blood, and dress out in suitable French this pointless farrago of horrors. There is a phase of contempt that, if indulged, transcends itself and becomes a phase of passionate self-satisfaction; so for the weal of our own spirits, it is better to think no more of Baudelaire or “King Pest.”

It is not the fashion of Poe's earlier tales to be pointless, however it may be with these sorry ones of the end. Pointlessness is, indeed, the very last charge that could be brought reasonably against them. He has the true story-teller's instinct. He knows the little nothings that make stories, or mar them. He knows how to enhance the significance of any situation, and give colour and life with seemingly irrelevant particulars. Thus, the whole spirit of “The Cask of Amontillado” depends on Fortunato's carnival costume of cap and bells and motley. When Poe had once hit upon this device of dressing the victim grotesquely, he had found the key of the story; and so he sends him with uneven steps along the catacombs of the Montresors, and the last sound we hear out of the walled-up recess is the jingling of the bells upon his cap. Admirable, also, is the use he makes of the striking clock at Prince Prospero's feast, in “The Mask of the Red Death.” Each time the clock struck (the reader will remember), it struck so loudly that the music and the dancing must cease perforce until it had made an end; as the hours ran on towards midnight, these pauses grew naturally longer; the maskers had the more time to think and look at one another, and their thoughts were none the more pleasant. Thus, as each hour struck, there went a jar about the assemblage; until, as the reader will remember, the end comes suddenly. Now, this is quite legitimate; no one need be ashamed of being frightened or excited by such means; the rules of the game have been respected; only, by the true instinct of the story-teller he has told his story to the best advantage, and got full value for his imaginations. This is not so always, however; for sometimes he will take a high note falsetto; sometimes, by a sort of conjuring trick, get more out of his story than he has been able to put into it; and, while the whole garrison is really parading past us on the esplanade, continue to terrify us from the battlements with sham cannon and many fierce-looking shakos upon broom-sticks. For example, in “The Pit and the Pendulum,” after having exhausted his bedevilled imagination in the conception of the pendulum and the red-hot collapsing walls, he finds he can figure forth nothing more horrible for the pit; and yet the pit was to be the crowning horror. This is how he effects his purpose (vol. i. p. 214):—

“Amid the thought of the fiery destruction that impended, the idea of the coolness of the well

came over my soul like balm. I rushed to its deadly brink. I threw my straining vision below. The glare from the enkindled roof illumined its inmost recesses. Yet for a wild moment did my spirit refuse to comprehend the meaning of what I saw. At length it forced—it wrestled its way into my soul—it burned itself in upon my shuddering reason. O for a voice to speak! oh horror! oh, any horror but this!”

And that is all. He knows no more about the pit than you or I do. It is a pure imposture, a piece of audacious, impudent thimble-rigging; and yet, even with such bugs as these he does manage to frighten us. You will find the same artifice repeated in “Hans Pfaal,” about the mysteries of the moon; and again, though with a difference, in the abrupt conclusion of “Arthur Gordon Pym.” His imagination is a willing horse; but three times, as you see, he has killed it under him by over-riding, and come limping to the post on foot. With what a good grace does he not turn these failures to advantage, and make capital out of each imaginative bankruptcy! Even on a critical retrospect, it is hard to condemn him as he deserves; for he cheats with gusto.

After this knowledge of the stage, this cleverness at turning a story out, perhaps the most striking of Poe's peculiarities is an almost incredible insight into the debateable region between sanity and madness. The “Imp of the Perverse,” for example, is an important contribution to morbid psychology; so, perhaps, is “The Man of the Crowd;” “Berenice,” too, for as horrible as it is, touches a chord in one's own breast, though perhaps it is a chord that had better be left alone; and the same idea recurs in “The Tell-Tale Heart.” Sometimes we can go with him the whole way with a good conscience; sometimes—instead of saying, yes, this is how I should be if I were just a little more mad than ever I was—we can say frankly, this is what I am. There is one passage of analysis in this more normal vein, in the story of “Ligeia,” as to the expression of Ligeia's eyes. He tells us how he felt ever on the point of understanding their strange quality, and ever baffled at the last moment, just as “in our endeavours to recall to memory something long forgotten, we often find ourselves upon the very verge of remembrance, without being able in the end to remember;” and how, in streams of running water, in the ocean, in the falling of a meteor, in the glances of unusually aged people, in certain sounds from stringed instruments, in certain passages from books, in the commonest sights and sensations of the universe, he found ever and anon some vague inexplicable analogy to the expression and the power of these loved eyes. This, at least, or the like of it, we all know. But, in the general, his subtlety was more of a snare to him than anything else. “Nil sapientiae odiosius,” he quotes himself from Seneca, “nil sapientiae odiosius acumine nimio.” And though it is delightful enough in the C. Auguste Dupin trilogy—it was Baudelaire who called it a trilogy—yet one wearies in the long run of this strain of ingenuity; one begins to marvel at the absence of the good homespun motives and sentiments that do the business of the everyday world; although the demonstrator is clever, and the cases in-

structive and probably unique, one begins to weary of going round this madhouse, and long for the society of some plain harmless person, with business habits and a frock coat, and nerves not much more shattered than the majority of his plain and harmless contemporaries. Nor did this exaggerated insight make him wearisome only; it did worse than that—it sometimes led him astray. Thus, in “The Pit and the Pendulum,” when the hero has been condemned, “the sound of the inquisitorial voices,” he says, seemed merged in one dreamy indeterminate hum. It conveyed to my soul the idea of *revolution*, perhaps from its association in fancy with the burr of a mill-wheel.” Now, it wants but a moment’s reflection to prove how much too clever Poe has been here, how far from true reason he has been carried by this *nimium acumen*. For—the man being giddy—the “idea of revolution” must have preceded the merging of the inquisitorial voices into an indeterminate hum, and most certainly could not have followed it as any fanciful deduction. Again, as before in the matter of effect, one cannot help fearing that some of the subtlety is fustian. To take an example of both sorts of imagination—the fustian and the sincere—from the same story “Arthur Gordon Pym :” the four survivors on board the brig *Grampus* have lashed themselves to the windlass, lest they should be swept away; one of them, having drawn his lashings too tight, is ready to yield up his spirit for a long while, is nearly cut in two, indeed, by the cord about his loins. “No sooner had we removed it, however,” Poe goes on, “than he spoke and seemed to experience instant relief—being able to move with much greater ease than either Parker or myself” (two who had not tied themselves so closely). “*This was no doubt owing to the loss of blood.*” Now, whether medically correct or not, this is, on the face of it, sincerely imagined. Whether correct or not in fact, it is correct in art. Poe evidently believed it true; evidently it appeared to him that thus, and not otherwise, the thing would fall out. Now, turn a page back, and we shall find (ii. 78), in the description of the visions that went before Pym while thus bound, something to be received very much more deliberately. “I now remember,” he writes,

“that in all which passed before my mind’s eye, *motion* was a predominant idea. Thus I never fancied any stationary object, such as a house, a mountain, or anything of that kind; but windmills, ships, large birds, balloons, people on horseback, carriages driving furiously, and similar moving objects presented themselves in endless succession.”

This may be true; it may be the result of great erudition in the thoughts of people in such sore straits; but the imagination does not adopt these details, they do not commend themselves to our acceptance, it is nowise apparent why stationary objects should not present themselves to the fancy of a man tied to the windlass of a dismayed brig; and, this being so, the whole passage, as art, stands condemned. If it be mere causeless fancy (as it seems), it is fustian of the most unpardonable sort; if it be erudition,—well then, it may be erudition, but never art. Things are fit for art so far only as they are both true and apparent. To make what I

mean clear: Mr. Ruskin, in some one or other of his delightful books, quotes and approves a poet (I think it was Homer) who said of a brave man that he was as brave as a fly; and proceeds, in his usual happy manner, to justify the epithet. The fly, he tells us, is in very deed the most madly courageous of all created beings. And therefore the simile is good—excellent good. And yet the reader’s instinct would tell him, I am sure, that the simile is a vile simile. Let him prefer his instinct before Mr. Ruskin’s natural history. For, though it be based on what is true, this comparison is not based upon a truth that is apparent; it does not commend itself to our acceptance; it is not art.

I have spoken at so great a length of these matters of method and detail, that no room remains to me to speak of the larger question—a question avoided also by Baudelaire on the same plea of want of space—why it is that these subjects interested Poe’s imagination—a question difficult of solution, indeed, but not insoluble with time. Nor have I left myself room to speak of what is perhaps still more important, the relation between Poe and his far greater and better compatriot, Hawthorne. That there is a consanguinity, that the two saw the world in a fashion not altogether dissimilar, that some of the short stories of Hawthorne seem inspired by Poe, and some of Poe’s short stories seem to be an echo of Hawthorne—all this is beyond question; but all this I can do no more than indicate.

Nor should the reader be surprised if a criticism upon Poe is mostly negative, and rather suggests new doubts than resolves those already existing; for it is Poe’s merit to carry people away, and it is his besetting sin that he wants altogether such scrupulous honesty as guides and restrains the finished artist. He was, let us say it with all sorrow, not conscientious. Hunger was ever at his door, and he had too imperious a desire for what we call nowadays the sensational in literature. And thus the critic (if he be more conscientious than the man he is criticising) dare not greatly praise lest he should be thought to condone all that is unscrupulous and tinsel in these wonderful stories. They are to be praised by him in one way only—by recommending those that are least objectionable. If anyone wishes to be excited, let him read, under favourable circumstances, “The Gold Bug,” “The Descent into the Maelström,” “The Cask of Amontillado,” “The Oval Portrait,” and the three stories about C. Auguste Dupin, the philosophical detective. If he should then desire to read more, he may go on, but warily; there are trap-doors and spring-guns in these two volumes, there are gins and pitfalls; and the precipitate reader may stumble unawares upon some nightmare not easily to be forgotten.

One word on the services of Mr. Ingram. This edition has evidently been a labour of love with him. Let us hope, in the next two volumes which are to complete the series, he may extend some of his love and labour to the scraps of French, which Poe was so fond of scattering about his pages. There are some deplorable errors abroad in the two under present consideration—errors

I should like to make clear to Mr. Ingram, some fine evening, over what he would call, or suffer his printers to call, a *façon* of *Clos de Vougeot*. ROBERT LOUIS STEVENSON.

Anatolica; or, the Journal of a Visit to some of the Ancient Ruined Cities of Caria, Phrygia, Lycia and Pisidia. By the Rev. E. J. Davis, H.B.M.’s Consular Chaplain, Alexandria. (London: Grant & Co., 1874.)

ASIA MINOR is one of the few countries within easy reach that have not yet passed into the domain of the ordinary tourist. While Palestine and Egypt are now annually visited by swarms of travellers of all kinds, and Mr. Cook can organise an “excursion” party for the Holy Land with as much *nonchalance* as he formerly felt in arranging one for the Rhine or Switzerland, the nearer provinces of Turkey in Asia still offer an interesting field for the more adventurous and enterprising traveller. The days are indeed past when he can hope, like Mr. Hamilton, or Sir Charles Fellows, to add materially to our geographical knowledge, or discover the sites of new and interesting cities, or to stumble unexpectedly upon such architectural remains as those of Azani, as was done by Lord Ashburnham just fifty years ago. But, with the exception of a few districts near the sea-coast, there is hardly any part of this great peninsula where an intelligent and observant traveller, who starts with a reasonable amount of information, and is content to describe things faithfully as he saw them, will not be able “to contribute something to our knowledge of a most beautiful and interesting country.” These are the words in which Mr. Davis has modestly described the object which he proposed to himself, and which he has fully realised in the work before us.

At the present day, indeed, the opening of the railway from Smyrna to Aidin, affording easy access to the ruins of Ephesus and the lovely valley of the Maeander, has been the means of attracting a largely increased number of tourists to Smyrna itself, very few of whom return from thence without having taken a passing glance at the remains of the far-famed city of Diana. But few and far between are those who avail themselves of the facility thus afforded them to extend their journey farther into the interior, though the highly interesting ruins of Hierapolis and Laodicea are situated within three or four days’ ride of the termination of the railroad at Aidin. These points have, however, been frequently visited as a part of “the Tour of the Seven Churches,” which has been repeated at intervals, more or less frequently, ever since it was first made by Dr. Smith, the chaplain at Constantinople, as far back as the year 1671; and was fully described by Mr. Arundell in 1828. This route, therefore, had nothing to offer in the way of novelty, and Mr. Davis exercised a very wise discretion in turning his steps from the site of Colossae towards the south-east into the comparatively little known regions of Pisidia and Lycia. No part of his route was indeed absolutely new; and the ancient sites which he visited had all been already de-

scribed. But the remarkable positions of *Sagalassus* and *Cremna* were still but imperfectly known, and his description of these interesting localities is accompanied with sketches of their plan and elevation which add materially to our knowledge. At the same time, this line of route led him through scenery of the most splendid character, and the descent through the vast forests that clothe the slopes of Mount Taurus to the plain of Adalia, which resembles the Campagna of Rome alike in its general aspect and its unhealthiness, appears to equal, if it does not surpass, any similar scene in the Apennines. A considerable portion of this descent lies along the ancient Roman road, which is still in such good preservation that it needs but little repair to render it as good as ever. But that little is not done. A bad mule-road is the only communication that exists with the important seaport of Adalia; and though there is a talk of a railroad, we entirely agree with Mr. Davis that it will be very long before a railroad is carried through the defiles of the Taurus.

Mr. Davis tells us that the desire to visit Anatolia was first aroused in him, when a boy at school, by receiving a copy of Sir C. Fellows's *Asia Minor and Lycia*. Hence, a visit to Lycia naturally formed part of his original scheme of travel, and he had proposed to proceed from Adalia through the south of Lycia to Xanthus and the Gulf of Makri; but already (though it was but May 10) "the heat was intense, the danger of malarious fever was every day becoming greater, and it was most probable they would find the villages along the coast deserted." They were, therefore, compelled to strike again into the uplands of the interior; and after visiting the highly interesting ruins of Termessus—first discovered and described by Lieutenant (now Admiral) Spratt in 1842—they proceeded through the highlands and mountain districts on the borders of Lycia and Caria until they rejoined their former route in the valley of the Meander. We are not aware that any traveller had traversed this tract of country since it was first explored by Messrs. Spratt and Forbes more than thirty years ago.

Mr. Davis has given us detailed and careful descriptions of the extant remains on the ancient sites which he visited, and as in several instances the localities had only been examined by one or two other travellers, these details possess considerable value for the purpose of comparison with the accounts already published. But the chief interest of his book will be found rather in the picture he gives us of the existing state of the countries which he traversed, than in his contributions to our archaeological knowledge. It is only from the observations of unprejudiced and intelligent travellers that we can form any just estimate of the real condition of the provinces of Asiatic Turkey; and Mr. Davis appears to us eminently entitled to claim this character. His long residence in the East, as consular chaplain at Alexandria, had moreover prepared him to judge of what he saw in Anatolia, from a different, and in some respects a juster, point of view than could be taken by a traveller fresh from the civilisation of Europe.

He began his tour in Asia Minor—as will

probably be now the case with most visitors to that country—by following the line of railway into the valley of the Maeander, a district of surpassing beauty and fertility, and which may vie in both respects with the richest plains and valleys of Italy. Nor are these natural advantages altogether thrown away. Both Aidin and Nazli are populous and flourishing places, and afford favourable specimens of Turkish towns:—

"There is even a good road, enclosed with walls and well-kept hedges in most parts, and on either side of it are olive grounds, vineyards, &c., in the highest state of cultivation; and it is this district that supplies the finest figs and raisins for the Smyrna market" (p. 63).

The tourist who pays a mere passing visit to Aidin, and looks down from the ruins of Tralles upon the beautiful and well-cultivated vale beneath him, will hardly be disposed to credit the accounts he has heard of the poverty and decay of Asia Minor. But very different is the result of a wider field of observation:—

"Except in the valley of the Maeander" (says Mr. Davis) "and a few of the larger villages, they" (the Turks) "do not seem even to take the least care of their fruit trees; and many of the mountain villages have no fruit trees excepting the walnut, which grows wild and thrives everywhere. . . . The portion of Anatolia which we visited is perhaps naturally the richest in the whole country; but the same aspect of decay prevails almost everywhere out of the Maeander valley" (p. 291).

The prevailing character of poverty and desolation at the present day is the more striking from the contrast it presents with the remains of former prosperity. "It was not so" (observes Mr. Davis) "in ancient times: all those desolate and lonely districts through which we had passed were once filled with thriving cities and a teeming population." Nowhere was our author more impressed with this contrast than on the site of Hierapolis, which, like its neighbour Laodicea, was famous in the days of Strabo for its woollen manufactures, as well as for its mineral waters:—

"I have seen" (he says) "few spots more gloomy and depressing than the old Thermae of Hierapolis. The rich gifts of nature are still there, but in place of the flourishing city with its polished and wealthy citizens, only the black tents of a few wandering shepherds, and the poor peasants of Pambouk Kalassi are left" (p. 112).

The remark may appear a trite one; but it is one that is perpetually impressing itself anew upon the mind of the traveller in Asia Minor.

That much of this poverty and decay is owing to the government cannot, we think, be denied. The taxation is oppressive, and the manner in which it is levied renders it doubly injurious. At the same time nothing is done for the people by the government: no roads, bridges, or other works of public utility are constructed for their benefit. The unhappy villagers are drained of all their resources, and are compelled to place themselves in the hands of merciless money-lenders, in order that the revenues extorted from them may be squandered in building palaces on the Bosphorus, or applied to the maintenance of a disproportionate fleet and army. "In short, the provinces are sacrificed to the capital, and while there is an air

of prosperity at Constantinople, the country is in a state of miserable decay" (p. 316).

Like all travellers who have wandered in the more secluded parts of Asiatic Turkey, Mr. Davis has been led to form in many respects a favourable estimate of the Turkish peasantry. They are hospitable, kindly to travellers, and in general strictly honest. The perpetual cry for "backsheesh," so troublesome to the tourist in the neighbourhood of Constantinople or Smyrna, is unknown in the interior. Nor are they wanting in industry. It is rather the skill to direct their industry that is wanting. The peasant himself, as in almost all countries, is ignorant and narrow-minded, wedded to the old routine to which he has been accustomed, and indisposed to believe in what are called "improvements." Unfortunately there is no superior class to enlighten him, or to lead the way to a better system. The utter want of comfort or convenience in their dwelling-places, which are mere hovels of the most wretched description, is a fact that must be painfully apparent even to the passing traveller; and no signs are to be found of a desire to improve them. It is true (observes Mr. Davis) that there is a deeper reason for this; for the least appearance of wealth or comfort would but make him a mark for the oppression of his superiors.

"What inducement is there for a man to work whose property is never secure, who is exposed to extortion if he has the appearance of wealth, and who is contented with a very moderate amount of comfort? Let but the Turkish peasant have some prospect held out to him, some inducement for exertion, and we may well believe that the motives which influence other men would not be without effect on him" (p. 315).

We are afraid that Mr. Davis's account of his travelling experiences in Anatolia is not calculated to attract any but enterprising and energetic travellers to follow his example. It is not as yet a land for the mere ordinary tourist.

"In Palestine and Southern Syria" (he observes) "the traveller finds little or no difficulty. The Syrian and Egyptian dragomans are well acquainted with the country. The stations for encamping are well known. The people readily bring supplies. It is easy to procure what the European stranger requires. In consequence, tent life there is possible—even agreeable in fine weather. But it is altogether different in Asia Minor. It is impossible to find a dragoman acquainted with the country, and the supply of provisions is scanty and bad" (p. 300).

To travel in Anatolia, he elsewhere remarks, "a man needs the digestion of an ostrich, the skin of a rhinoceros, and the strength of a horse." These hardships are undoubtedly mitigated, if one travels *en Milordos* with tents, plenty of attendants, and ample supplies; but even then there are many unavoidable privations, while the traveller can gain but little acquaintance with the people. But if he has courage to brave these discomforts, he will be amply rewarded by the picturesque beauties of a country which Mr. Davis (with perhaps a pardonable exaggeration) does not hesitate to rank "far before Italy in general," and many districts of which he considers even to equal the far-famed environs of Naples.

But discomfort and privations are not all that the traveller has to fear in Asia Minor. Besides the ever-recurring danger of malaria,

which is not confined to the sea-coast, though it there assumes its most treacherous and deadly form, he runs no small risk from brigands. It is true that brigandage does not assume in these Turkish provinces the professional and chronic character which it possesses in Greece, but outbreaks of it are not unfrequent, and are sometimes of a formidable description. Mr. Davis himself and his travelling companion had in one instance a fortunate escape. They had intended returning from Adalia to Aidin by way of Makri and Moollah, but were induced by the fear of heat and malaria to change their route, and proceed through the mountains by Cibyra. Had they taken the route originally proposed, they would have arrived at Makri on the very day that a band of mountaineers, seventy or eighty strong, came down and pillaged the whole neighbourhood, blockaded Makri and Levesi, captured several Greek vessels, and drove off the government troops and *douaniers* who attacked them in the first instance. Nor were they defeated and dispersed till a detachment of regular troops was sent against them. Very much the same state of things is described as existing in Lycia in 1854; and although Mr. Davis found no molestation in the course of his tour, and was able to write that there appeared little danger from robbers in that portion of Anatolia, he adds in a subsequent note that all this was changed; and the Constantinople journals for the latter part of the year 1873 were full of accounts of brigandage and robberies from all quarters. We hear so much less of brigands in the Turkish provinces than in Greece, that many people are apt to suppose that the former enjoy an immunity in this respect, which is certainly far from being the case.

E. H. BUNBURY.

Ten Years of Gentleman Farming at Blennerhasset, with Co-operative Objects. By William Lawson, Charles D. Hunter, F.C.S., and Others. (London: Longmans & Co., 1874.)

THIS is a book altogether *sui generis*. The subject of it is an establishment which existed from 1862 to 1872 at Blennerhasset, "a village of about 200 inhabitants, on the south side of the little trout stream, the Ellen, about eighteen miles west of Carlisle, and about ten miles east of Maryport," and which "included a farm, extensive farm-buildings, a market garden, artificial manure works, steam-ploughing machinery, a laboratory, a free library, a free school, and several grocery shops"—several of the above branches extending to other places besides Blennerhasset, even so far as Newcastle and Carlisle—and of which the owner was Mr. William Lawson, son of the late, and brother of the present Sir Wilfrid Lawson.

The book may be inferred to have in all seven authors, named and unnamed (though two are only critics), and two of them seem to have exercised editorial functions; for although Mr. Hunter appears to hold himself "responsible for the matter and arrangement," Mr. Holyoake not only writes the introductory chapter, but annotates the volume to the end. The latter-named gentleman is also responsible for the publication,

as having had "no hesitation in thinking that the story of 'Ten Years at Blennerhasset' was worth printing;" and a debt of gratitude is due to Mr. Holyoake for so thinking. For although the work will be "caviare to the general," it will—to say nothing of the value for purposes of scientific agriculture of its elaborate details and statistics of farming experiments—be appreciated by all who can relish a narrative of the quaintest social experience, prompted by genuine benevolence, and told with transparent candour, and with an almost constant undercurrent of quiet humour, in thoroughly good English. One thing to be regretted is, considering the kind of intellectual sea-sickness which figures produce in many minds, that the work could not have been divided into two volumes, or at least into two distinct portions, to the latter of which might have been confined all accounts and statistics. As a concession to human frailty, it may be mentioned that, after the first chapters, comprising 220 pages of the book, its interest is almost purely technical. Yet even the latter chapters, besides the detail of some interesting experiments in farming without cattle, contain facts of the highest value as to the cost of labour in farming: the results of Blennerhasset experience being that every 1s. increase on 16s. wages, or say 1s. 3d. in the pound, will only increase the cost of production by about 3½d. in the pound. And it is remarkable that, from 1866 when it was at its maximum, the cost of labour per acre went on constantly diminishing, from 5l. 1s. 3½d. to 1l. 16s., although in 1867 the hours were reduced from ten and a half to nine. It is not, indeed, stated expressly whether this reduction of hours was or was not attended with one of wages, and, curiously enough, amidst the numerous tables in the book, there is none showing the fluctuations, if any, in the rate of wages, nor is there any express statement of the average rate; though as the figures of a week in 1870, varying for men from 2s. to 3s. 2d. per day, are given as those of an average week, the inference is both that there were no substantial fluctuations in the figures, and that there was no reduction consequent on the reduction of hours in 1867; which, in other words, means that there was an important virtual rise in wages on that occasion. The general conclusion is, therefore, that the cost of labour sank while its price rose.

This conclusion seems further borne out by the fact that the great fall in the cost of farm labour (from 5l. 1s. 3½d. per acre in 1866 to 2l. 10s. 4d. in 1867) nearly coincided with the establishment of a bonus system, although none was in fact paid before 1869. The writers, one is bound to say, express themselves very guardedly on this point: "From the steady nature of this improvement" (in the cost of labour per acre),

"I think co-operation should be credited with a share in it. I know that after the first taste of bonus money in 1869, there was more faith exhibited in it by the workpeople, and in many instances a real endeavour was made to keep down the expenses and further the business."

Again:—

"As far as mere figures go, co-operation seems not to have been without effect on the labourers, so marked is this decrease in the cost of labour."

But when the nature both of the farming and of the co-operation practised at Blennerhasset is considered, the wonder is not so much that there should be any doubt as to the influence of the latter in stimulating the exertions of the labourer, as that it should have exercised any influence at all. Mr. Miller Tiffin, one of the authors, in a graphic chapter on "The First Steam-Plough in Cumberland, its Adventures and Vicissitudes," tells us that 1,510l. was paid "in finding out what *would* answer, by first finding out what *would not* answer." What he says of the steam-plough is in fact applicable to the whole system of Blennerhasset farming, which may be said to have consisted of a series of agricultural experiments, extremely valuable to those who did not carry them on. Mr. Lawson, writing with that candour which is pre-eminently characteristic of the book, says:—

"The labourers had been accustomed all their lives to have their labour dealt with by those who simply tried to buy it as cheap and sell it as dear as possible, and were, of course, unable to fall in with an entirely different order of things at a moment's notice. . . . But if they doubted my *will* to benefit them by co-operation, perhaps they were still more doubtful of my *ability* to do so. They saw me buying and selling, but not *getting gain*; and under these circumstances it was not to be wondered at if simple-minded labourers supposed that no contrivance could make my co-operation profitable to them. Moreover, they probably considered my practice of trying experiments upon the farm a great objection to co-operating with me. For not only were the experiments I thought proper to have tried expensive—without the prospect of direct profit to myself—but the great importance to the public of intelligently tried agricultural experiments did not then seem to be realised by farmers generally, much less by farm-labourers not at all accustomed to scientific investigation, or even to calculation of any sort."

It was probably at least premature to ask the farm-labourers to co-operate in agricultural experiments "without the prospect of direct profit" to the trier himself, and the offer of one-tenth of his profits under such circumstances might well fail to stimulate their exertions. But the very peculiar form which co-operation soon assumed for Mr. Lawson must now be shown.

For some years the system of distributive co-operation as usually practised in the North, in which,—after a payment of a fixed dividend of 5 per cent. per annum on capital, surplus profits are divided either solely among shareholders in proportion to their purchases, or partly also to non-shareholders in the like proportion (with the exception in some cases of a percentage for educational purposes),—was sufficient for Blennerhasset, and Mr. Lawson and some of his coadjutors seem to have done some vigorous missionizing in Cumberland on its behalf. But nearly from the first another system (if it may be so called) was proposed, which came to be known as the "Timothy Tarbucket system of shopkeeping," from the name of an ideal shopkeeper, viz. that of appointing "some person shopkeeper for the public good, paying him a certain fixed rate of interest on such capital as he would have to devote to the business, while he was to supply goods to the public at large at the cheapest possible rate. He was to render

public accounts, periodically, of all the transactions of the shopkeeping business he would thus be conducting, as the public servant, for the public good." It is transparent that "Timothy Tarbucket" could be none other than William Lawson; and accordingly, though the former was voted down for some time at meetings, in favour of the Rochdale system, "free co-operation," as it was termed, at last carried the day. In 1867, Mr. Lawson tells us,

"I published a statement declaring that all the profits over 2½ per cent. per annum on a stated amount of my capital, during a certain time, would be devoted to the *public good*, and I invited everybody who was able and willing to co-operate with me for that end, to do so in any way that occasion might offer, and particularly in the matter of making, for the public use, as much profit as possible on the capital devoted to the public good, on the terms above mentioned."

But, remarkably enough, when in 1868 he realised a profit even beyond what had already been spent in advance for "the public good," and consulted his neighbours, in public meetings at Blennerhasset, Ireby, and Aspatria, how the balance was to be spent, "the strongest desire was shown that this profit be given to those who made it, meaning that it should be given proportionately to the workers employed in the establishment."

However, Timothy Tarbucket was not to be balked, and accordingly a shop was set up on his principle at Newcastle—which after five years was wound up with a loss of £44l. 10s. 2d.; one at Carlisle, wound up after three years with a loss of £20l. 17s. 4d.; one at Ireby, wound up after a year with a loss of £48l. 11s. 2½d.; and one at Blennerhasset itself, handed over in 1872, after six years' existence, and a loss of £43l. 9s. 1½d. to "The People's Shop Company (Limited)," a company which, after paying 7½ per cent. on capital, gives profits to purchasers. Thus the "free co-operation" principle resulted in every instance in loss, and in the one case in which it did not lead to entire failure, yielded the day to a system which gives 50 per cent. more profit to capital than the Rochdale one, without the same guarantees for the purity of articles and fair-dealing.

But Timothy Tarbucket had a larger sphere of action still than the shops. The whole estate was virtually worked on his principle—and at the discretion of Mr. Lawson. The crowning experiment was that indicated in the last extract, of farming with the advice of all the world. A practice of calling together for consultation some of the head officials grew into one of summoning to council all the labourers, male and female, and then into an "open council," where "the right to discuss and vote was not limited to the workers, but any one was welcome to attend and give the benefit of his or her advice;" and which eventually took the name of the "Blennerhasset Parliament," and was held at the school-room. It is remarkable that while even the "open council" lasted, the workers seem to have taken their part as co-operators in farming *au vif*, as is shown by motions like the following, brought forward by labourers at the third meeting: "That we clear our meadow of sticks and stones before the mowing

season;" "that the twitch be taken out of the land." But, as Mr. Lawson says himself, the workers grew "tired of counselling," and the village parliament became apparently a very original kind of debating society, in which the affairs of the farm were indeed discussed, but rather as part of Blennerhasset affairs in particular, and of those of the world in general, than on their own bottom, and which appears to have been invested with a special control (how far absolute is nowhere stated) over the expenditure in the "public good departments." As summed up by Mr. Hunter, the expenditure under this head between 1866 and 1872 amounted to £1,301l. 12s. 10½d., which was applied to the following purposes: "Co-operative meetings, agricultural experiments, free library and reading-rooms, free schooling, free bath-room, noble temple, public assistance," and "festivals and trips."

But after 1867, a year known as the "great bonus year," when a balance was found on the right side of £1,715l. 4s., and £46l. 4s. 7½d. of this was awarded as bonus to the workers, making £10l. 19s. 11d. to every full-time worker, Mr. Lawson seems to have been very little upon or near his farm. In 1871 a double misfortune fell upon the concern. The potato disease was particularly bad, when the acreage laid down in potatoes had been increased to nearly a quarter of the whole farm, and the farm buildings were burnt down. It seemed clear to Mr. Lawson that his farming "was very far from becoming remunerative, and from giving prospect of becoming so." He had had "a pretty good spell" of it, and therefore sold the whole concern to his brother. The free library and reading rooms still remain, and the testimony of a former bailiff to the parliament is, that many young men are indebted to it "for much of the knowledge they possess." Mr. Holyoake bears witness of "the undoubted regard in which Mr. Lawson was held among the common people," and the modest judgment which Mr. Lawson passes on his own work should disarm hostile criticism:—

"My hope is that if it shall appear that my objects were right in the main, and the ends I sought to accomplish justifiable in themselves, others may not be discouraged from prosecuting them with better knowledge and judgment."

J. M. LUDLOW.

Social Pressure. By the Author of "Friends in Council." (London: Daldy & Isbister.)

SIR ARTHUR HELPS' books, if they possessed no other merit, would still be valuable to our hurry-scurry age by recalling to us the sense that there is—or used to be—such a thing as Leisure somewhere on the globe. Over all of them there broods the peacefulness of one of those fine old gardens, well-sheltered and sunny, with broad straight gravel walks, wherein it was permitted to saunter for hours, now pausing to look at the old stone sun-dial, now stooping to pick a pink from the border, and now and again diverging to the lichen-covered red brick wall along whose summit the peacock was marching, and select the most luscious of peaches or the richest of figs. Merely to think of gentlemen of the calibre of "Milverton" and

"Ellesmere," and "Cranmer" sitting down in our day to enjoy what Dr. Johnson used to call a "good talk," seems to put back the clock of time for a century; but when Sir Arthur Helps proceeds to represent them as actually composing elaborate essays for no other purpose than to read them to one another, and then put them aside, we instinctively cry out, "It is too much!" The anachronism is beyond the licence of fiction. Who is there in our time who dreams of such "idlesse" as this except the sanguine young lady who gets up a "Pen and Pencil," and asks a celebrated writer, whose lightest MSS. are so many cheques, to "favour her with a little tale, or a piece of poetry, he could do it so beautifully?" It is all about as probable as that a distressed needlewoman should amuse her leisure moments with crochet-work; and though we have learned entirely to believe in the Ellesmere and Milverton party, and feel them to be familiar "friends in council" indeed, we reject the authenticity of their reputed essays with scorn, and are convinced Mr. Johnson has forged them himself in the intervals of his duties as librarian and secretary.

Putting aside the improbability that in a company of five English gentlemen and two English ladies, three of the former should nearly monopolise all the talking, and the ladies meekly consent to keep a golden silence, except when their husbands suddenly chance to refer to them about some trivial subject within their feminine sphere; the management of these dialogues is, as usual, excellent and ingenious, and we do not remember any volume of the series containing more suggestive passages or touching on more interesting themes. The fault of the book indeed, if fault it have, is that it skims over too many matters on which we should like to know more of what Sir Arthur Helps thinks, and that we regret to see one topic slide off into another before the first has been exhausted. There is, if we mistake not, a good deal of the mellow wisdom of increasing years and knowledge of human nature revealed in these pages, both pleasant and profitable to consider. Take, for example, the dissertation on Growing Old, towards the close of the present volume. How good are the remarks, that we begin only in later years to "find out the truth in trite sayings, of sayings which were little more than so many well-connected words to us at our outset in life;" and that "the great affections of the mind, Hope, Fear, and Love, have only changed their objects, but not lost their force!" Still deeper goes the observation that "the immortal soul does not grow old in seventy years. Often it feels itself to grow younger, because it thinks less about itself, is less perplexed about its own doings, is less socially sensitive, and has therefore wider sympathies, and enters more heartily into the enjoyments of others." To these remarks the great lawyer, "Sir John," adds, that if he is ever to be tried for a crime, he trusts there will be many elderly men on the jury, for he has observed that they are far more indulgent, as well as just, than younger ones. "Milverton" also thinks that in later years we come to lose some of our over-apprecia-

tion of showy gifts of eloquence and wit, and estimate better more sterling qualities. Finally, a very important conclusion is that, in looking back over life, we find that "our fellow-men are after all much better fellows than from history and biography or our first impressions they appeared to have been." A Prime Minister it seems once received as a legacy of experience from a great statesman before him this summary of his opinion of mankind: "Oh, they are capital fellows—much better fellows than you would imagine, but deuced vain you know! deuced vain!" We must confess to have proceeded so far towards the stage of life indicated by Sir Arthur in these remarks as to have arrived entirely at this opinion.

There are a great many sound political hints and reflections in the book with which we shall not meddle, save to note the specially true remark that, while a small political question (such as the Ballot), sets the nation in a ferment for years, a great social or sanitary reform, such as the improvement of our cities—can scarcely obtain a hearing. It is absurd to hope that the legislators in Westminster, who are so entirely indifferent about the smoke which is defacing their own new Palace, should trouble themselves much to remove similar nuisances at a distance. They are wholly occupied with political concerns. Between the party who cry "Make men free, and all will go well," and the party who cry "Make men clean, comfortable and sober, and all will go well," there seems to be no room for the rational medium, or any plan extant by which the two sets of aspirations may work side by side.

The first essay in the book relates to the evils to man and beast caused by the exorbitant dimensions of London. It is, we think, as hopeless for Sir Arthur Helps to set them so cleverly in array, as for the pious Fénelon to endeavour to deter his young friend (who was desperately in love) from marriage on the ground that "*Le mariage est un état de tribulation très pénible auquel il faut se préparer en esprit de pénitence.*" We may be assured that London is very dark, very smoky, very unwholesome; that people who are ill or wounded here do not recover as rapidly as they used to do in the hospitals; that gilding is tarnished and furniture ruined, and horses worn out, and that Sir Rutherford Alcock brought over two bricks which had stood unhurt on the Wall of China for a thousand years, and which have disintegrated and are crumbling away after two years on his balcony not half a mile from Westminster Abbey. It may be all very true, and it may be a state of "tribulation" in which we live; still, as Mr. Pecksniff would have said, we love this "humble village in which we take the liberty to reside," and, narrowing our poetical and patriotic fervour within the limits of the Metropolitan Police Act, each of us says in his secret soul,

"*London! with all thy faults I love thee still; "*
or, as Arthur Locker has it—

"I hope I'm fond of much that's good,
As well as much that's gay;
I'd like the country if I could,
I like the Park in May."

He who has once felt the attraction of the

mighty magnet—who has touched the throbbing heart of the world—would count it somewhat of a banishment even to be sent to the "Isles of the Blessed" themselves.

FRANCES POWER COBBE.

History of Merchant Shipping and Ancient Commerce. By W. S. Lindsay. In Four Volumes. (London: Sampson Low, Marston, Low, & Searle, 1874.)

MR. LINDSAY has undertaken a great work in writing the history of merchant shipping, as it is the history of human enterprise under one of its most interesting forms, and there is hardly any branch of human science which that enterprise has not made tributary to its advancement. The subject also is very vast, regarded from the point of view from which Mr. Lindsay has proposed to treat it, namely, in immediate connexion with the commerce both of the ancient and of the modern world, and with the great changes which have taken place in the over-sea carrying trade since Vasco de Gama doubled the Cape of Good Hope, and Columbus discovered a new world in the far West.

"Many years," writes Mr. Lindsay (Introduction, p. xvii.), "have already been employed in collecting materials for this work, but hitherto time has been wanting for the study and elucidation of a subject which, from the nature of my avocations, can hardly fail to prove interesting to myself, whatever it may be to my readers. To trace the origin of navigation and to detail the numerous steps by which the merchant vessels of the great trading nations of the world have reached their present state of perfection; to record those discoveries in science and art connected with navigation, which enable the mariner to cross the ocean without fear and with unerring certainty; to dilate upon those triumphs of man's genius and skill whereby he can bid defiance to the elements; and to enter in these pages the names of the men who have benefited mankind by their maritime discoveries, or by affording greatly increased facilities for intercourse between nations, is to me a task of the most gratifying description."

We have no doubt that the research which distinguishes this work has been to its author a labour of love, and that his professional knowledge has invested with peculiar charms the enquiry, with which his work commences, into the maritime commerce of the Præ-Roman world.

One of the most remarkable features in the history of merchant shipping is the fact that the maritime carrying trade of the world has been, at successive periods, vested in the hands of small states, insignificant in territory and in population as compared with their neighbours, yet by reason of their maritime activity more powerful than them. Phœnicia may be cited as a leading instance, for its average breadth never exceeded twelve miles, and its extreme length was about 225 miles; and Mr. Lindsay justly remarks that "to trace the course of the extensive maritime trade of the Phœnicians is to elucidate the progress of navigation in ancient times." Mr. Lindsay is of opinion that modern research fully confirms the judgment of Herodotus, that

"the Phœnicians were really immigrants from the shores of the Persian Gulf; thereby in themselves affording an illustration of that great law of migration westwards of which that of Abraham

and of his family, and that of Chedorlaomer from Elam to the valley of the Jordan, are the earliest recorded instances."

Mr. Lindsay is also of opinion that the "Cassiterides Insulæ" were unquestionably the Scilly Isles, and that they were frequented by Phœnician vessels, and that "it seems not improbable that the Phœnicians, while still in their old homes on the Persian Gulf, may have found their way in prae-historic ages to India, and may there have met with tin, as it is abundant at Banks in the Straits of Sumatra," and that as the Sanskrit name for tin is *kastira*, "when in later days they found it again in even greater abundance in England, they gave it the name they had previously adopted from the far East."

Mr. Lindsay in his fourth chapter examines very carefully the question whether the Phœnicians discovered the route from India round the Cape of Good Hope, and is of opinion that the weight of evidence is in favour of the discovery. That it should have remained unprofitable until the Portuguese opened out the route at the close of the fifteenth century after Christ, would not of itself justify our disbelief in the story, which Herodotus narrates, of the famous voyage of discovery undertaken by Phœnician mariners in the reign of Pharaoh-Necho. Mr. Lindsay very appositely remarks that the circumstance, which led Herodotus himself to disbelieve the story from his ignorance of spherical geography, "affords the strongest confirmation of the report of the Phœnician mariners;" for in sailing westward, south of the line, the sun would at noon appear on the right hand of the observer, and not on his left, as in sailing westward in the Mediterranean.

Mr. Lindsay has not omitted to call attention to the fact that the greatness of Tyre, the capital of Phœnicia, was in all probability not only due to her geographical position, and to the circumstance that her people understood both how to build ships and to navigate them better than their neighbours, but likewise to the free and enlightened policy of her merchants. They were the first to establish the system of factories or agencies in foreign countries. "They admitted the merchants of other countries freely to their markets," and

"to the Tyrians belongs the credit of the establishment of the first regular colonies, some of which, such as Carthage, probably far surpassed in wealth and power the mother city; nay, what is more, they succeeded in planting their colonies on terms so liberal as to retain throughout all time an affectionate remembrance from their children; for we know, that as Tyre refused the aid of her fleet to Cambyses when he wished to attack Carthage, so Carthage offered a refuge to the inhabitants of Tyre when besieged by Alexander."

In striking contrast to the policy of Tyre was the policy of Egypt. "All nations were merchants of Tyre," whereas in Egypt foreign merchants and sailors were restricted to the single port of Naukratis, on the Canopic mouth of the Nile—a practice, as Mr. Lindsay observes, which "recalls the custom of the Chinese up to a very recent period." The ancient Egyptians were, in fact, neither a nautical nor a commercial people. Their sailors, to use Mr. Lindsay's words, "were

bargemen rather than seamen," and however numerous they may have been, they were employed chiefly in boats on the Nile and on the canals.

"We may presume," writes Mr. Lindsay, "that till the time of the Ptolemies the Egyptians did not build any large sea-going ships, one reason of this being that Egypt, within her own territory, had no forest timber adapted for such a purpose. Hence, as is well known, arose the sanguinary wars so long and so fiercely waged between the Ptolemies and the Seleucidae—the inheritors from the Tyrians of the forests of Lebanon, who, mindful of the elder time as well as of the value of their property, were little inclined to give the Egyptians the means of becoming a powerful maritime people."

Mr. Lindsay has illustrated his work with several interesting drawings of extraordinary vessels, and among the most remarkable of them is a drawing of the great ship of Ptolemy Philopator (i. 62); but Mr. Lindsay has not furnished the reader with a representation of the vessel as described by Athenæus. Like the great Athenian dramatist, whose custom it was to represent men as they ought to be, rather than as they are, Mr. Lindsay has represented the *Great Eastern* of the Ptolemies in the form best calculated, according to his nautical knowledge, to fulfil "the requirements of a structure meant to float in safety," but for this purpose he assumes that there is a mistake in the measurements handed down to us by Athenæus. Ptolemy's ship is described by Athenæus, after an account drawn up by an Alexandrian historian named Callixenus, as measuring 280 cubits in length, 38 cubits in breadth, and 48 cubits in depth, while the highest part of her poop was 53 cubits above the water. Mr. Lindsay considers the proportion of the length and beam of the vessel so described to accord very well with those of the large ships of our own time, but he considers it hardly possible to conceive that the depth of the hold was so great, or that the highest portion of the poop of the vessel was about 80 feet above the water; "the depth," he says, "was much more likely to have been 28 cubits, for which 48 has, through some misapprehension, been substituted." Mr. Lindsay has accordingly given us an imaginary drawing of the vessel on this assumption, and it is calculated to make the constructors of our modern leviathans hang down their heads in despair to outrival the graceful lines of such a model. It is, however, permissible for the student of classical antiquity to have some misgivings as to the alleged error in the narrative of Athenæus, and as Mr. Lindsay himself admits that Ptolemy's vessel could hardly have been meant for sea-going purposes, those of his readers who may have seen the towering stern of the Chinese junk, which floated some few years ago on the waters of the Thames, may be disposed to think that a Chinese ship-carpenter would have readily undertaken to build a vessel after the description furnished by Athenæus, and would have warranted her to float in safety, if that was to be the modest limit of her capability. A more decided view of the account of Athenæus has been advanced by M. Jal in his *Archéologie Navale*, *Mémoire No. 1*, which has not been noticed by Mr. Lindsay, although it is a work of no mean

authority. M. Jal does not hesitate to repudiate the whole story about the "big ship" of Ptolemy, and observes that if there had been men foolish enough to build such a vessel, there would certainly not have been found men fortunate enough to navigate her. We do not think it necessary to adopt this extreme view, and to repudiate the whole story, in declining to accept Mr. Lindsay's correction. The *Great Egyptian* was, in our opinion, a huge barge with an enormous deck-house, and the conception of such a floating monster was in accordance with the colossal character of all Egyptian structures. "There is no reason," Mr. Lindsay adds, "to question her existence. Such a vessel might have remained moored in the Nile, or in one of the great lakes or canals, as a pleasant place of resort during the hottest months of an Egyptian summer."

One of the most interesting chapters in Mr. Lindsay's first volume is the ninth, in which he suggests a novel solution of the much vexed question, how the galleys of the ancients were classed and rowed. His theory is

"that the paddle-wheel steamer of to-day resembles in her structure (though materially improved and possessing the vast advantage of mechanical power) the row-galley of the ancients. Her machinery and coal-bunkers are distinct and separate from the hold, cabin, or any other portion of the ship, while the engines and paddle-wheels take the position and act the part of the rowers and their oars."

In other words, Mr. Lindsay considers that "the rowers on board the first-class galleys, even when they amounted to 300 men, did not occupy a larger space in the ship than would now be required for a steam-engine of 150 horse power and her fuel for twenty days." He suggests, accordingly, that the first-class galleys were divided into compartments, and were only decked fore and aft, the midship portion, which the rowers occupied, being left open for ventilation. Mr. Lindsay has illustrated his theory by an excellent design (i. 293), and it certainly obviates one great difficulty, as it keeps the fighting men apart from the rowers, and allows the latter to be berthed in that part of the ship, in which there would be space for their bedding and scanty apparel without interfering with the accommodation and the munitions of the fighting men.

Mr. Lindsay is disposed to trace the pre-eminence of the Rhodians in maritime jurisprudence to their descent from the Phoenicians. That there should have been a Phoenician element in the Rhodian civilisation is highly probable, but it is not unreasonable to suppose that the island of Rhodes was a centre of maritime commerce, holding a position in the Aegean Sea, after the fourth century before Christ, analogous to that which the island of Wisby occupied in the Baltic Sea in the fourteenth century after Christ, and that the Rhodian sea-laws, of which fragments are incorporated in the Digest of Justinian, were not enacted by the islanders, but were a collection of usages observed by the mariners and merchants of the Levant, who frequented the port of Rhodes, and which commended themselves to other nations from their intrinsic equity and convenience. Mr. Lindsay has com-

mitted an oversight in a note (i. p. 392), in which he represents M. Pardessus as an authority for attributing the compilation of the Maritime Law of Wisby to Magnus, who became King of Sweden in A.D. 1320. The laws which M. Pardessus has attributed to Magnus Ericson, and rightly so, are a very different body of laws, namely, the Wisby Stadt-Lag, and the capital contention of M. Pardessus is that the Maritime Law of Wisby is a compilation of German, Flemish and Dutch maritime usages.

Mr. Lindsay has not attempted to solve the problem how the Phoenicians made their way to England—whether they hugged the shores of Spain and of France, as their Carthaginian descendants hugged the western coast of Africa on their voyages to the island of Cerne, which Mr. Lindsay rightly identifies with the island of Arguin, in 20°5' N. lat.; or whether they trusted to their discovery of the Cynosure (called after them Phœnice), the last star in the cluster of the Little Bear, to which Mr. Lindsay refers as enabling them to give superior fixity to their observations at sea; neither does he suggest, so far as we are aware, any measure of the time which they occupied in their voyages to the coast of Cornwall out and home. He has observed that the fleets of Tarshish are represented in the Chronicles of the kings of Judah as "coming once in every three years," and it may be not a rash conjecture, that the trade of the Phoenicians with the West was carried on similarly by periodical fleets, whose voyages from the Pillars of Hercules to the Cornish coast, going and returning, occupied at least a year, if not two years.

We know from the curious narrative of Abraham Farrisol, a learned Rabbi of Avignon, that so late as in the fifteenth century after Christ the galleys of Venice, which traded with Flanders, hugged the coast the whole of the voyage, and that they were generally absent from home for eighteen months, and in some cases for two years; yet the Venetian navigators of that period used the mariner's compass as distinguished from "the sailing stone," notwithstanding which advantage they never ventured out of reach of the headlands. It is not, therefore, very probable that the Phœnician mariners, whose knowledge of the loadstone may be doubted, would have ventured to steer by the stars into the open waters of the Bay of Biscay on the expectation of striking the mouth of the English Channel by the help of some rude method of dead reckoning.

We regret that Mr. Lindsay has disposed of the invention of the mariner's compass in a brief note (i. 233). He is, we think, perfectly justified in stating in his introduction (p. xlii.), that there is no good warrant for the idea that the Chinese were acquainted with the mariner's compass in remote ages; but when he intimates his opinion, that Amalfi has no claim to the invention of the mariner's compass, and that "it was most likely a northern discovery"—induced, perhaps, to adopt that view by what Wachsmuth, whom he quotes, has stated as to its being in use in Sweden in A.D. 1250—he has overlooked, we think, the distinction which is to be drawn between the mariner's compass and

the loadstone or sailing-stone. Mr. Hallam, whom Mr. Lindsay also quotes, has fallen into the analogous error of confounding the "marinière" with the mariner's compass. The "marinière," which is commemorated by French poets of the twelfth century, and which was familiarly termed "la grenouille" (the frog) by French mariners, was a needle of magnetised iron floating in water on a card or on a cork, which was only serviceable in a smooth sea. This was, no doubt, in general use before the time of Flavius Goja, of Amalfi, but it was a very different instrument from the needle mounted on a pivot fixed in a box (*pyxis nautica*), the invention of which has been attributed to Goja, and whose claim has been persistently maintained by his native city bearing the emblem of a boxed compass on her civic banner. It would be an interesting subject of investigation for Mr. Lindsay—and we believe there are ample materials for such an enquiry—to trace the successive stages of invention by which the mariner's compass has been brought to its present state of perfection; for the "complete mariner's card," or "la Rose," as it is termed by French sailors, with its lily denoting the north, its cross denoting the east, and its double-headed eagle denoting the west, belongs probably to a period subsequent to the accession of the Emperor Charles V. to the Spanish throne, and the invention of the "gimbals" has been stated by Montuccia to be claimed for the English. Further, Mr. Lindsay would only fulfil the promise held out by him in the Introduction to his work, if he would in one of his forthcoming volumes detail the stages, by which astronomical science has supplied the mariner with lunars and other methods of finding the longitude. We have searched in vain also for some account of the invention of the hanging rudder, with its pintles and gudgeons, as the vessels represented on the corporate seals of the maritime towns, of which Mr. Lindsay has given illustrations, are either without rudders or exhibit, if we mistake not, the steering-oar or Latin rudder. It may be matter of doubt whether the modern rudder with its pintles and gudgeons was a Flemish or an English invention, as the earliest corporate seal on which such a rudder is engraved is a seal of the town of Damme, in Flanders, which is appended to a charter of A.D. 1328, while the earliest coins on which it is found are the gold nobles struck by Edward III. after the memorable sea-fight of the Swyn. Our space compels us to pause, on the threshold of the discovery of the New World, which is narrated by Mr. Lindsay in the two last chapters of his first volume. Mr. Lindsay has done full justice to the noble character of Columbus, and to the generous heart, of his faithful patroness, Isabella of Castile; and we take leave with regret of his instructive work at the moment when the history of Ancient Commerce enters on a new phase.

TRAVERS TWISS.

AMONG recent Spanish publications is a translation direct from the Sanskrit of Kalidasa's drama of *Vikramorvasi*, by Don Francisco Garcia Aynso, whose essays on Indo-European Philology will be familiar to the readers of the *Revista de España*.

Travels in South America, from the Pacific to the Atlantic Ocean. By Paul Marcoy. (London: Blackie & Son, 1875.)

THE translation of the "Voyage de Paul Marcoy" appears to have met with considerable favour at the hands of the English-reading public, the present being the second edition, and the "Opinions of the Press," as recorded on a fly-leaf to the first volume, being commendatory in an unusually high degree. Even in its abridged form the work comprises two quarto volumes of some 500 pages each; illustrated by 525 engravings on wood, and ten maps. On a careful perusal of the book and comparison with other contemporary works relating to the same regions, it is difficult to come to any other conclusion than that its success must be due almost solely to the profusion of its pictorial illustrations; the text surely cannot have been read by any of the public critics who have spoken of it in such glowing terms of praise. The first defect which strikes us is the lack of precision and air of unreality that permeate the whole narrative. No dates are given; we have a statement prior to starting to the effect that it was then "one fine morning in the month of July," but no year is mentioned, not even for the commencement or end of the journey, and local descriptions and important incidents are so disguised that it is not without some difficulty that the period can be fixed. Undoubtedly, the style is lively; but the liveliness and dash of the writer are employed for hundreds of pages on nothing but the most insignificant details. Performing a journey of great length and risk across the South American continent at its broadest part, across snowy Andes, through picturesque defiles, and along the fertile equatorial plains, his shallow jauntiness is never subdued, and his remarks concerning the sublimest scenes are always destitute of earnest feeling. Scores of pages of the narrative are occupied with the record of frivolous dialogues, of which the following is an example:—

"There are rats here," I cried.

"Impossible!" said Nor Medina.

"Monsieur has taken the guinea-pigs for rats," said one of the women.

"Has a guinea-pig got a tail?" I asked.

"Well, no," said Nor Medina; "but even supposing they were rats," he added, "the noise you made has so frightened them, that it is a hundred to one they will not return to-night."

And so on *ad nauseam*.

We do certainly find in the chapters devoted to the Peruvian portion of the journey plenty of descriptive and historical matter relating to the Incas and Inca civilisation; a great part of this has been necessarily compiled from other and more original works; but it is very readable, and so far has its merit. The numerous illustrations of Inca remains give an air of solidity to this part of the work. But we are warned against accepting without confirmation any new matter introduced by the author relating either to the history or the geography of Peru, when we meet with criticisms like the following, from a traveller of solid reputation (Professor Raimondy), who has since gone over some of the same ground. In his paper on the "Rivers San Gavan and Ayapata," in the 37th volume of the *Journal of the*

Royal Geographical Society, p. 118, this eminent savant, who is Government Surveyor of Peru, has occasion to remark:—

"In a work published in Paris in 1861, *Scènes et Paysages dans les Andes*, the author, who signs himself Paul Marcoy, gives an account of an expedition he made by the *quebrada* of Marcapata in search of the town of San Gavan, and says that the river Ollachea unites with that of Marcapata; which is absolutely false, for I have followed and personally seen the junction of the river Gavan and the Inambari."

He adds in a note, "Marcoy's work contains many other inaccuracies, and should be looked upon as the product of a vivid imagination rather than as a truthful composition;" and further on (p. 130), he exposes a fictitious statement in the same work on a question of Peruvian history.

We have said that it is not without some difficulty that the date of these remarkable travels can be fixed. The only clue to this we have been able to find is the mention of Padre Plaza, the famous missionary patriarch of Sarayacu, on the Ucayali, and of the circumstance that the author in his journey down this great river travelled in the company of a French scientific expedition. Now, as Padre Plaza died in 1848, and the only French expedition in these regions during his time was that of Count de Castelnau in 1846, there is *prima facie* reason for supposing this to be the year of our traveller's descent of the river. A further examination establishes this date conclusively. In Paul Marcoy's narrative the Count is, in fact, introduced and abominably satirised, under the pseudonym of the Duke de la Blanche Epine, and the objects of the expedition are throughout ridiculed in the most childish manner, although it was one carried out with rare courage and devotion, and fruitful in results in almost all branches of science, as proved by the noble series of volumes of its Report subsequently published. Turning to the narrative of this expedition in the hope of finding some means of identifying our unsatisfactory artist-traveller, we find, it is true, no "Paul Marcoy," but a certain "Monsieur de Saint-Cricq" mentioned, a "dessinateur," whom Count Castelnau picked up at the identical village on the upper waters of the Ucayali where "Paul Marcoy" describes his meeting with the "Duc de la Blanche Epine." Very little is said by the Count about this gentleman. He was asked by his host in the village to allow him to accompany the expedition down the river, and the request was granted: "la position pénible dans laquelle il se trouvait me fit consentir" are the words used. The ingratitude of the artist is the more to be wondered at when we learn that during the perilous voyage the life of M. de Saint-Cricq was saved, on the upsetting of a canoe in the rapids, by M. Deville, a member of the expedition. He was finally left behind, at his own request, at Sarayacu.

The comparatively remote and concealed date of Paul Marcoy's travels would not, of course, detract from the value of his descriptions and delineations of scenery and people, were there not other grounds for suspecting the trustworthiness of the author. The countries he traversed, however, are rapidly

changing, if not progressing, in their social and economical aspects, and in these respects dates are an important factor. Scientific value the work can lay no claim to. But the author has evidently had the ambition of shining in this direction, for he enters (vol. i. p. 173 *et seq.*) into a long disquisition on the races of the American continent, and exhibits his competency as an instructor by classifying the Aztecs, Toltecs, Aymaras, &c., as belonging to the *Irano-Aryan* race, in contradistinction from the rest of the American tribes, who are Mongolo-American. With regard to the illustrations with which the two volumes are so bountifully supplied, they appear to us very unequal both as to fidelity and artistic execution. Many of the landscapes and town views are undoubtedly based on sketches taken on the spot, but some of this class are spoilt by conventional additions evidently made by artists at home. Some of the views of forest and river scenery in the second volume are exquisitely beautiful, and faithful both in detail and general effect; they are so true, that we are inclined to think these must have been engraved from photographs; but none the less credit is due to the wood-draughtsman, engraver, and printer. We except from this commendation all the representations of Indians: they are, with some few exceptions, gross caricatures, and fail to give any approach to a just idea of their physique and the expression of their features. The translation by Mr. Elihu Rich strikes us as exceedingly well done—free from stiffness and all traces of foreign idiom.

H. W. BATES.

Far from the Madding Crowd. By Thomas Hardy. (London: Smith, Elder & Co., 1874.)

Far from the Madding Crowd is so clever a novel, so original in atmosphere and in character, that its brilliant qualities are likely to neutralise the glare of its equally prominent faults. The writer has the advantage of dealing with an almost untouched side of English life. His scene is laid somewhere in the country of Mr. Freeman's favourite *Searsaetas*, in a remote agricultural and pastoral district of south-western England. Among peasants who look on Bath as a distant and splendid metropolis, it is likely that much of the old country existence lives on undisturbed. The country folk in the story have not heard of strikes, or of Mr. Arch; they have, to all appearance, plenty to eat, and warm clothes to wear, and when the sheep are shorn in the ancient barn of Weatherbury, the scene is one that Shakespeare or that Chaucer might have watched. This immobile rural existence is what the novelist has to paint. "In comparison with cities," he says,

"Weatherbury was immutable. The citizen's *then*, is the rustic's *now*. In London, twenty or thirty years ago are old times; in Paris, ten years or five; in Weatherbury, three or four score years were included in the mere present, and nothing less than a century set a mark on its face or tone. Five decades hardly modified the cut of a gaiter, the embroidery of a smock-frock, by the breadth of a hair. Ten generations failed to alter the turn of a single phrase. In these nooks the busy out-

sider's ancient times are only old, his old times are still new, his present is futurity."

No condition of society could supply the writer who knows it well with a more promising ground for his story. The old and the new must meet here and there, with curious surprises, and our world may find itself face to face with the quaint conceited rustics of Shakespeare's plays. Such a story might be written as George Sand has often told of the *vallée noire*, sober characters and simple might appear in the foreground of scenes exquisitely quiet and harmonious. In our opinion the writer of *Far from the Madding Crowd* has only partially succeeded in making the best of his theme, and though his failure is more valuable than many successes, he has been misled by attempting too much. In his way of looking at his subject he rather resembles George Eliot than George Sand. He contemplates his shepherds and rural people with the eye of a philosopher who understands all about them, though he is not of them, and who can express their dim efforts at rendering what they think and feel in language like that of Mr. Herbert Spencer. It is this way of writing and thinking that gives the book its peculiar tone. The author is telling clever people about unlettered people, and he adopts a sort of patronising voice, in which there are echoes, now of George Eliot, and now of George Meredith. Thus there are passages where the manner and the matter jar, and are out of keeping.

There are three circles of interest in this story,—first, the rural surroundings, the effects of weather and atmosphere, the labours of beasts and men, as the lambing of sheep, and such mild struggles with Nature's storms and rains as M. Victor Hugo would scarcely find dramatic enough for his tremendous canvas. Next, there are the minor characters—a sort of chorus of agricultural labourers, very ready with advice, very helpless, and very much taken up with themselves, as was the way with the ancient chorus. Last, there are the main persons of the drama—the people in whose passions and adventures the interest ought to centre. Of these three component parts of the tale, the first may be pronounced nearly perfect, and worthy of all praise. We might instance the description of Norcombe Hill by starlight, in the beginning of the second chapter, as an original and admirable treatment of nature—of nature which is more and more tending to become a main interest in our modern fiction. We prefer to quote the enumeration of the signs by which the hero detected the approach of a storm, because the quotation includes the sheep, whose birth and death, in this tale, are narrated with great minuteness.

"The sheep were crowded close together on the other side around some furze bushes, and the first peculiarity observable was that, on the sudden appearance of Oak's head over the fence, they did not stir or run away. They had now a terror of something greater than their terror of man. But this was not the most noteworthy feature: they were all grouped in such a way that their tails, without a single exception, were towards that half of the horizon from which the storm threatened. There was an inner circle closely huddled, and outside these they radiated wider apart, the pattern formed by the flock as a whole

not being unlike a vandyked lace collar, to which the clump of furze bushes stood in the relation of the wearer's neck.

"This was enough to re-establish him in his previous opinion. He knew now that he was right, and Troy was wrong. Every voice in nature was unanimous in bespeaking change. But two distinct translations attached to these dumb expressions. Apparently there was to be a thunder-storm, and afterwards a cold continuous rain. The creeping things seemed to know all about the latter rain, but little of the interpolated thunder-storm; while the sheep knew all about the thunder-storm and nothing of the latter rain."

When the thunder-storm bursts, it is described with much pictorial effect; and is a quite disagreeable enough trial to Oak, the English Gilliat, and contender with Nature.

Coming from the scenery to the chorus, we are a good deal puzzled. Few men know the agricultural labourer at home, and it is possible that he is what Mr. Hardy describes him. The labourers are all humourists in their way, which is a very dreary and depressing way. Odd scraps of a kind of rural euphuism, misapplications of scripture, and fragments of modern mechanical wit, are stirred up into a queer mixture, which makes the talk of Henery Fray, Cainy Ball, Jan Coggan, and especially of that pre-eminent bore, Joseph Poorgrass. Do labourers really converse like this—

"I look round upon life quite promiscuous. Do you conceive me, neighbours? My words, though made as simple as I can, may be rather deep for some heads."

"Oh yes, Henery, we quite conceive ye."

"A strange old piece, goodmen—whirled about from here to yonder, as if I were nothing worth. A little warped too. But I have my depths; ha, and even my great depths! I might close with a certain shepherd, brain to brain. But no; oh, no!"

Here is another specimen of rural speech.

"For a drunk of really a noble class, and on the highest principles, that brought you no nearer to the dark man than you were afore you began, there was none like these in Farmer Everdene's kitchen. Not a single damn allowed, no, not a bare poor one, even at the most cheerful moment when all were blindest, though the good old word of sin thrown in here and there would have been a great relief to a merry soul."

"True," said the maltster, "nature requires her swearing at the regular times, or she's not herself; and unholy exclamations is a necessity of life."

And so on. Shepherds may talk in this way: we hope not; but if they do, it is a revelation; and if they don't, it is nonsense, and not very amusing nonsense.

Leaving the servants, and coming to their master and mistress, we cannot say that we are greatly fascinated with the persons, or much concerned in their fortunes. Nothing could be more true or more careful than the study of Troy, the handsome sergeant, with his half education, his selfishness, his love, which he only finds out to be something like true love under the influence of remorse. When the soldier erects a costly tomb to the woman whose heart he has broken, and plants flowers on her grave, in such a way as to wound to the quick the woman he has married, we recognise an insight, and a touch, like that of Flaubert. But we cannot easily pardon Bathsheba, the heroine, for losing her heart to Troy's flattery, and to the glitter of his brass and

scarlet. Indeed we have some difficulty in being much moved by Bathsheba's character and mischances. When we first see her, she is stealing a look at herself in a mirror, unconscious of the presence of young Farmer Oak. When she hears that Oak has asked her aunt for leave to court her, and has been discouraged, she runs after the exemplary man, and explains that she is heart free. Then she sends a valentine, with a seal *marry me*, to Farmer Boldwood, and so fascinates that apparently calm, but really passionate rustic. Meanwhile, Oak fails as a farmer, and Bathsheba, having become a farmer in her own right, takes him on as shepherd, and has "curiously confidential" passages with him. At last, the gay serjeant fixes her fancy with a display of swordsmanship, and she drives alone at night to Bath, and is married to him. We feel inclined to say to her, as Mr. Buckstone does to Galatea in the play, "You're sure it's innocence?" The young lady's misfortunes deepen, as Troy spends her money, and takes to drinking. There is a very powerful and strange scene between them when she opens the coffin of her dead rival, Fanny Robin, and her husband kisses the lips of the corpse, and tells his wife that he only loved the dead. It is a situation worthy of the drama of Webster or of Ford, and wild as it is, is led up to in a perfectly natural way. This part of the tale, including Fanny Robin's terrible walk, to her rest in the workhouse, is eminently tragic, and is not improved by the commonplace tragedy of the *dénouement*. We leave Bathsheba wedded to the worthy Oak, a capital overseer, and a husband who may be trusted. We hope the babies were "put in the papers, every man jack of them," as Mr. Oak promised when he wooed. Bathsheba is so seldom on the level that her troubles with her husband raise her to, that we feel she does not decline on Oak, and have no sense of her as wasting her sweetness. It is unlikely that even her remorse for having tempted Boldwood would lead her into her foolish latter relations with such a man, and, on the whole, we cannot look on Bathsheba as a firmly designed character. In spite of this want of success, and of incongruities of tone, *Far from the Madding Crowd* displays undeniable talent, which has scarcely as yet found its best and easiest and most natural expression. In taking leave of an interesting, provoking, and clever story, we must say a word in praise of the graceful illustrations.

A. LANG.

CURRENT LITERATURE.

Among the Trees. By William Cullen Bryant. (New York: G. Putnam's Sons.) Mr. Bryant studies nature as Wordsworth did. It is not to him as it is to many other poets, a mirror in which his own moods are reflected; but he lays himself aside, and reverently and sympathetically listens to whatever nature has to tell him. He literally "lives not in himself, but becomes portion of that around him." In "A Forest Hymn," "An Inscription in a Wood," and in the poem before us, "Among the Trees," this passion for what we should call "inanimate nature" is distinctly marked, and the poet's expression of it is most felicitous when trees are his subject. There is something specially attractive to him in their strength, their grace, and their constantly renewed

life. The following lines are from the commencement of the poem:—

"Trees of the forest and the open field,
Have ye no sense of being?
When on your winter sleep
The sun shines warm, have ye no dreams of spring?
And when the glorious spring-time comes at last,
Have ye no joy of all your bursting buds,
And fragrant blooms and melody of birds
To which your young leaves shiver?"

Nay, doubt we not that under the rough rind,
In the green veins of these fair growths of earth,
There dwells a nature that receives delight
From all the gentle processes of life,
And shrinks from loss of being. Dim and faint
May be the sense of pleasure and of pain
As in our dreams; but, haply, real still."

The conclusion of the poem falls off when the poet leaves the trees and speaks of human beings. It would have gained in force by the omission of the last eleven lines. The illustrations are beautiful, and the book, though a small one, is altogether one of the most attractive that have appeared this Christmas.

FROM Messrs. Warne we have received a new translation of Andersen's *Fairy Tales*, by Mrs. H. B. Paull; also Grimm's *Fairy Tales*, by the same translator; and a revised edition with notes of the *Arabian Nights Entertainments*, by the Rev. Geo. Fyler Townsend—all of which are prettily bound and illustrated, and will be sure of a hearty welcome in any nursery which they may gladden these holidays.

Nursery Rhymes, Tales and Jingles, with 400 Illustrations, is a most delightful encyclopædia of nursery lore. The rhymes and tales have been admirably arranged by Mrs. Valentine, and her notes to several of them are extremely interesting. For instance, many people are ignorant that the original of "The House that Jack built" is in the Chaldee language, and is presumed to be a hymn; or of the antiquity and original version of "Little Jack Horner."

The Fiery Cross, or the Vow of Montrose. By Barbara Hutton. (Griffith & Farran.) This is the story of the great Marquis told from a Royalist point of view, and it has the usual faults of a one-sided story. But hero-worship and prejudice are carried to a dangerous extent when they prompt such a passage as the following, which occurs when Montrose receives the news of King Charles's death, and says that life henceforward has no charm for him. His chaplain tries to rouse him from despair, saying:—

"Die! my lord. On the contrary, talk not of death! Summon up your courage and fortitude. Revenge the death, the murder, of your royal master, and support his son. . . . The worthy chaplain in speaking of revenge had touched the right chord. Montrose immediately roused himself. Drawing himself to his full height, he stretched his hands towards heaven, and as one inspired he cried, 'Yes! yes! I will live. But I vow before God and man to devote my life to avenge the royal martyr's death and to place his son on the throne.'"

However true it may be that Dr. Wishart, in his capacity of chaplain, urged revenge, it cannot be said that it was a proof of worth, and is hardly to be held up to the admiration of youth. The story of Montrose is so interesting in itself, so full of stirring adventure, and of misfortune nobly borne, that it will always be popular; but we could wish that it had been written in a calmer and less prejudiced manner.

Hetty; or, Fresh Watercress Sellers. By Mrs. Henry Keary. (Warne & Co.) A short religious story, the scene of which is laid with tolerable success in very poor life.

The Floral Poesy: A Book for all Seasons. (Warne & Co.) A book about flowers, with appropriate quotations of poetry. The subject is not strikingly original, and the illustrations are poor.

The Billow and the Rock. By Harriet Martineau. (Routledge.) It is refreshing to see reprints of H. Martineau's stories; we get very few of the same high order of writing among the popular tales of the present day. This one is founded on the incidents of Lady Grange's captivity, and is full of interest and power.

Naval Enterprise and Military Enterprise. With Coloured Illustrations. (Warne & Co.) Two closely-printed little volumes, containing stories of sailors and soldiers, which are sure to be popular with boys.

Aesop's Fables. With Fifty Illustrations by Harrison Weir. (Routledge.) A cheap and attractive edition of a book which can never be old. The translation is a new one, by the Rev. George Fyler Townsend, and the preface is interesting.

The Reedham Dialogues. By John Edmed. (James Clarke & Co.) A harmless little book of dialogues for children. If it helps to lessen the amount of noise and obstruction in the streets on November 5, by its discouragement of "Guys," it will have accomplished a useful mission.

Waking and Working; or, From Girlhood to Womanhood. By Mrs. G. S. Reaney. (H. S. King & Co.) The story of an ideal young lady who does good to every one around her, and specially to an unbelieving doctor, whom she converts and marries. There is some pretty writing in the book, but it is crude.

Opening a Chestnut Burr. By the Rev. E. P. Roe. (Routledge.) This is an American story on the same subject as the last-mentioned book. Only in this case the unbelieving young man is more hardened, and it takes nearly double the number of pages to convert him. The heroine starts on her crusade with the assertion that "she thinks she can disturb the even current of the hero's vanity." Certainly, if unceasing sermonising is meant to have that effect, she does not spare him. He proves his remarkable fortitude and strength of mind by marrying her—but he does it with his eyes open.

Prince Perindo's Wish (Edinburgh: Edmonston & Douglas), is a really pretty fairy tale, with many clever touches in it, and it has the merit of not being too long.

FROM Messrs. Marcus Ward we have received *Aunt Charlotte's Stories of French History*, which in spite of many hard names and much necessary condensation contrives to convey to children many interesting facts and picturesque details of the history of France, and is most attractively bound and illustrated.—*The Fairy Spinner and Out of Date or not.* Two stories of unusual merit; the trials of Ethelsiege and the final triumph of her love being gracefully told; while the second story, of a knight who comes back to the world 400 years after his death and finds that philanthropy has taken the place of chivalry, is original and good.—*Turnside Cottage*, the story of a boy who rose from being a cowherd to be a village schoolmaster.—*Pollie and Jack*, an excellent story in simple language for little children.—*The Twin Brothers of Elvedale*, which no one would expect from its little gay cover of roses and lilies to be a Norwegian love story with an attempt at murder, numerous whaling adventures, and a death by drowning in it.—*Puck and Blossom*, a charming book for children, with most fairy-like illustrations and prettily-told stories.—*A Cruise in an Acorn*, also beautifully illustrated.—*Roses with and without Thorns*, a well-told story of two exceptionally naughty little children.—*Katie Summers*, a simple story for the nursery.—*Ella's Locket, and what it brought Her*, a little book that will disappoint small readers, as the locket never brings Ella anything except a relation whom she did not want. And two prettily illustrated volumes of *Scottish Scenery* and *English Lake Scenery*, which bring pleasant thoughts of summer in this wintry weather. F. M. OWEN.

NOTES AND NEWS.

EDLER VON PLENER's interesting monograph on English Building Societies will shortly be published in an English dress by Messrs. Abel Heywood and Son. The translator, Mr. F. J. Faraday, of Longsight, has added notes explanatory of the operation of the new Act, which was only in prospect when Von Plener wrote.

The Fern Paradise; or, a Plea for the Culture of Ferns is to be the title of a little book from the pen of Mr. Francis George Heath, author of *The English Peasantry*. Mr. Heath's new book, which will be published shortly by Messrs. Hodder and Stoughton, has for its object to increase the popular taste for the most graceful and beautiful forms of vegetable life. It will include descriptions of ferny rambles through the green lanes, the woods and the glens of Devonshire, "the home of our native ferns."

DR. RICHARD MORRIS will put off for a time the preparation of his volume of *Selections from Chaucer's Minor Poems* for the Clarendon Press.

DR. ABBOTT'S *How to Parse* will be out next week.

THE Rev. T. V. Bridgett, in his just published *Our Lady's Dowry*, points out that the "Alma Redemptoris," sung by Chaucer's little martyr in the *Prioresses Tale*, was the antiphone with that title which has been in use in the Roman Catholic Church for many centuries. It is sung during Advent and until the feast of Candlemas; and Chaucer makes the child say that he will learn it "ere Christmas be went." So the boys in the school were supposed to be practising, during Advent, the music they were singing in the church.

THE collection in the British Museum known as the Egerton Manuscripts has lately been enriched by the following purchases:—

Two Paper Rolls of the time of Henry VII., formerly belonging to Sir W. Le Neve, containing instructions for painted windows at the Grey Friars of Greenwich, representing English Sovereigns and Saints.

Copy of Ordinances of War, 9 Richard II., and a printed order for payment of a loan, February 14, 1643 [4] signed by Charles I. and Lord Keeper Littleton.

Eight letters of Lord Palmerston to H. B. Hoppner at Lisbon, 1831-1833.

Autograph letters of the Prince de Condé to Baron Gelb, 1793-1796, and letters of Cardinal de Rohan, dated March 26, 1794, and January 26, 1797.

"Liber Pacis," or List of Persons on the Commission of the Peace, 16 Elizabeth, with notes by Lord Burghley.

"The Constitution of the Loyal and Friendly Society of the Blue and Orange," founded by the officers of the King's Own Regiment of Foot, 1714, with devices.

A fifteenth century Treatise on Falconry, in Italian, with coloured drawings.

Letters of Prince Charles Buonaparte and other Naturalists to G. R. Gray, F.R.S., 1831-1871.

Copies of Miniatures and ornamentation from the Vatican Virgil and other ancient MSS. in Italy, by Mrs. Conolly.

Copies made in the last century from MSS. at Corpus Christi College, Cambridge, relating to Ecclesiastical affairs of the period of the Reformation.

A parchment roll containing an inventory of the Reliques in the Monastery of St. Bertin, of St. Omer, 1465.

Muster Roll of scholars of Winchester School, 1706.

We also notice an original letter of Lord Byron, dated July 21, 1807, to Mr. Crosby, offering his stanzas "To Jessie," a copy of which is enclosed, for publication in *Monthly Literary Recreations*.

The above-mentioned Cardinal de Rohan writes

from Brussels, and signs himself "✠ Pr. Ferd. de Rohan arch. duc. de Cambrai." He is best known to posterity by his connexion with the notorious *affaire du collier*, or diamond necklace fraud.

The following are a few of the entries on the Rolls of Instructions for painted windows at Greenwich included in the above lists:—

"Edlurga a nonne dought' to Seynt Ethelbert kyng of kent lying at Canterbury—Make her aft' th'abyte of a nonne crowned w' an open crowne & w' a crosse on her ryght hand and a booke on her left hand w' a mantell of Seynt Ethelberts armes."

"Charles y' marter kyng of Fraunce—make hym in th'abyte Royall & lyke a peassible kyng w' a berde w' an open crowne & on his left hand a septime & in his ryght hand a ball w' a crosse."

"Kyng Henry the vijth—make hym on the Ryght syde of the gret Red Roose lyke a yong man in a hoole Image standing in his Robes & abyte Royall of astate of purpull colour w' a close crowne Imperyall, in the Ryght hand a ball w' a crosse & in the left hand a septime and make his countenance lokyng towards y' quene his wyf stondyng by hym holdyng Iche oder by y' hand."

ORIENTALISTS will rejoice in the completion of the fifth volume (*add to 'cyn*, pp. 1759-2219) of Mr. Lane's *Arabic Lexicon*, which is just leaving the printer's hands. To give some idea of the magnitude of this work, we may mention that the amount already published in the five volumes—extending over more than two thousand two hundred pages, super-royal quarto—is more than double the entire lexicon of Freytag. Besides the main use of Mr. Lane's work as the authoritative lexicon of the Arabic language, the light it throws on the manners and customs of the early Arabs; on the idioms of the Semitic races, which have ever been the stumbling-blocks of biblical critics, and which nothing but the intimate acquaintance with the Semitic mind which Mr. Lane possesses can explain; and on many points connected with the literature, law, religion, and customs of the East;—is of priceless value to the student.

THE Parisian lovers of fine books—of impressions out of the common—are just now all agog about an edition of *Manon Lescaut*, published at the moment of our writing by a young publishing firm—Glady Brothers. It is printed on Turkey mill paper; has illustrations by Flameng and Jacquemart, and—even more notable thing—a preface by Dumas *filis*, written with consummate literary art, and with an audacity hardly less consummate. Before proceeding to analyse the work of L'Abbé Prévost, M. Dumas takes occasion to rate the mere book hunter, who, when he has purchased a fine copy of a *chef-d'œuvre*, instead of reading it, only sends it to the binder. And from this little bit of personal audacity, Dumas proceeds to further boldness, in discussing the natures of whom Manon Lescaut is a symbol.

In the *Revista de la Universidad de Madrid* there is a memorial sketch of Heinrich Ahrens, whose writings have "powerfully contributed to the incipient renovation of Spanish culture." He was born at 1808, and graduated in Göttingen (his thesis was entitled *De Confederatione Germanica*). His reputation as a "privat docent" in the philosophy of law was so great that Guizot invited him to give a course at Paris. While professor at Brussels he was elected a deputy of the celebrated Frankfurt Parliament. Afterwards he filled Chairs at Grätz and Leipzig. He died August 2, aged sixty-six. The *Cours de Psychologie fait à Paris sous les Auspices du Gouvernement* has been translated into Dutch and Spanish, but has not been so popular in Spain as his other writings. His *Cours de Droit Naturel* has passed through six editions in French, six in German, four in Spanish, four in Italian, one in Dutch, one in Portuguese, and one in Hungarian. This is his greatest work, and is now used as a text-book in Spanish America, while its influence in Old Spain has been very great. Besides *Die Organische*

Staatslehre (Wien, 1850) and *Juristische Encyclopædie* (Wien, 1857), he was a frequent contributor to reviews and other periodicals.

THE Scotch papers announce the death, at Edinburgh, of Alexander Leighton—not a great man certainly, but one who for half a century has done such honest labour in the field of literature, that he deserves a passing notice in the journals of his calling. He had reached the ripe age of seventy-four, having been born in Dundee in the year 1800, and was a distinguished pupil in the Academy of that town, then a mere straggling village. He afterwards studied medicine in Edinburgh, but abandoned it for the law. The law in turn was deserted for literature, and to this, his last love, he clung to the end of his long and laborious life. A complete list of his writings it would be next to impossible to give. He was ready to write on almost any subject, as well as to edit and adapt the less popular writings of others. Writing much, not for fame but for his daily bread, he could scarcely be expected to write in every case well. Yet many of his works had a wide circulation, and his name is held in deep respect all over the south of Scotland. This was mainly owing to the popularity of *The Tales of the Borders*, commenced originally at Berwick-on-Tweed by John Wilson, but after his death, with some little assistance from Hugh Miller, the geologist, conducted almost entirely for years by Leighton. They are not above criticism, but are written with much spirit, and have fairly kept their hold on the rustic imagination. They are still reprinted. He was also the author of *The Romance of the Old Town of Edinburgh*, *The Men and Women of History*, *Jephtha's Daughter*, *The Tangled Yarn*, a Latin metrical version of the songs of Burns, sufficiently meritorious to gain the praise of Carlyle; a dictionary of religious denominations, perfectly impartial, though he himself was a warm admirer of David Hume; a good novel, and a host of other books. He was also generally believed to be the author of various religious and other works, on the title-pages of which the names of less able men appeared. Be this as it may, literature has had few more laborious workmen. He was almost the last of the purely professional men of letters, journalists aside, who still have their permanent home in the "grey metropolis of the North."

In the article on Mr. Mullinger's *History of the University of Cambridge* in our last issue, in par. 2, line 7, for "Antonius" read "Ausonius;" in the last paragraph, for "mystic" read "mythic" and for "Casstebro" read "Cantebro."

THE *Nation* states that the valuable Squier collection of American antiquities from Peru, Central America, and the Mississippi valley, now and for some time past on temporary deposit at the Central Park Museum, is in the market, and is, it is feared, likely to be sold out of the country. The same paper, in chronicling the death of Mr. Ezra Cornell, founder of the university which bears his name, remarks:—

"No one with half a million dollars, or with fifty times that sum, is going to found off-hand a university at which 'anyone may learn anything he desires;' and there was nothing in the start which Mr. Cornell gave to his creation which either did or could bring it nearer his idea than the older colleges like Yale and Harvard, by furnishing it something which should take the place of their accumulated wealth, traditions, and culture. There was, if we may say so without the slightest disrespect to his memory, in his belief in the power of mere money to accomplish what he sought, something of the 'short-cut' notion to which 'self-made men' seldom rise superior, and which is a main cause, perhaps, of that scattering of endowments which we daily have to deplore. To abstain, however, from praising the liberality of his conception simply because it was one which would not have been entertained by a highly-educated man, possessed of even greater means, would of course be absurd. He will be permanently and prominently remembered among those Americans, already too numerous to

recall by a single effort of the memory, who have returned to the public the wealth which they had acquired by their own exertions. He had the good sense to make this return in his lifetime, and the good fortune to witness the contagion of his example leading to the still further endowment of his university on a scale hardly less munificent than his own."

WHATEVER may be the judgment finally passed upon the judicial and Parliamentary labours of the late Lord Romilly, he will never be forgotten as the Master of the Rolls who brought the work of writing English History within the bounds of possibility. Before 1851 the public records of the kingdom had already to a great extent been brought together under his official custody in the new repository erected for their reception. But the imposition of fees for permission to search and copy, made the boon an illusory one to literary enquirers who were not in the exceptional position of commanding an almost bottomless purse. On July 7 a memorial from Lord Mahon, the present Earl Stanhope, and others, on the subject, was forwarded to the Master of the Rolls, and met with a prompt response. Regulations for the free admission of literary enquirers were approved by the Treasury on November 17, and were issued on December 4 of the same year, a date which marks the commencement of a silent revolution in one great class of English literature, the consequences of which will doubtless be more permanent than those of the *coup d'état* which had taken place in Paris two days before.

Many, however, who accepted the invitation to the intellectual banquet prepared for them, must have felt as deep a sense of disappointment as that which troubled the soul of Sancho Panza when his dinner was waved away from him in the island of Barataria. The documents were there in countless numbers, but who was to guide them in their search for the special entries which they wanted? Sir John Romilly at once met the demand for help. On December 7, 1855, he stated to the Lords of the Treasury, that although "the records, state papers, and documents in his charge constitute the most complete and perfect series of their kind in the civilised world," and although "they are of the greatest value in an historical and constitutional point of view, yet they are comparatively useless to the public, from the want of proper calendars and indexes." The result of these words is already seen in that magnificent series of Calendars of State Papers which is going steadily on towards completion, to say nothing of those other indexes still in manuscript, which are available to all who need them.

The publication of the Calendars served as a guide to those who were able to examine the State Papers on the spot, and they might be used, though with considerable caution, even by those who were at a distance from London. Two years later, in 1857, a further step was taken. Hitherto the Master of the Rolls had contented himself with rendering accessible the documents in his own custody. He now constituted his office into a medium for the "endowment of research" on historical matters. The State Papers could not be traced earlier than the reign of Henry VIII. Before that date there was on the one hand a vast collection of legal and historical records which might be submitted to the slow process of calendaring. But outside the walls of the office there were numerous chronicles and other writings, either never printed at all, or insufficiently edited. This was the mine to which Sir John Romilly summoned labourers from all sides, and the goodly rows of the *Chronicles and Memorials of Great Britain and Ireland during the Middle Ages* are the result.

Nor was this all. To know England as it was painted by Englishmen is, after all, something like knowing a man as painted by himself. To complete the picture we must cross the seas, and the archives of Simancas and Venice, of Paris and Vienna, must be sedulously ransacked. This, too, came to be part of the growing plan of the late Master of the Rolls.

No doubt, acts of this kind can never be wholly ascribed to a single individual. The public can never know, never ought to know, how much of counsel and advice, how much of skilful execution is to be placed to the credit of Sir Thomas Hardy and the able staff around him. But, after all deductions are made, the great fact remains that this important change was carried out not, as an old Roman would have said, under Lord Romilly's auspices, but as his personal act, and under his constant and direct supervision. When some years ago those who had profited most by his activity subscribed to place a bust of the late Master of the Rolls in the Literary Search Room, they only represented the gratitude which will be felt by all who follow in their footsteps.

MR. CARLYLE has told us that the constituent elements of the most remarkable Parliament that ever sat—definable, indeed, as the Father of Parliaments, which first rendered Parliaments supreme, and has since set the whole world upon chase of Parliaments—deserve "a history, constitutional, biographical, political, practical, picturesque, better than most entities that yet have one among us." Whether a writer will ever be found capable of treating the Long Parliament in the exhaustive manner above expressed, it is impossible to say. Our intention is but to contribute in a very slight degree to so great a subject, by printing a petition, lately turned up among the State papers, of one of its honourable members. Oxford, we believe, was the constituency represented by the petitioner, until he was disabled:—

"To the hon^{ble} the Committee at Goldsmith's hall.

"The humble Petition of John Whistler of Graies Inne, sometimes an unworthy member of the Commons house of Parliament,

"Humbly sheweth

"That he hath neither given nor lent any money, horse, or arms unto his Ma^{ty}, nor any waies aided or assisted him in this intestine warre, only was p^{re}s^{ent} at the meeting of some of the members of Parliament at Oxford, albeit very much against his will.

"For, goeing into the country to attend the execution of the Commission for regulating of forrests with the county of Oxon (being by the hon^{ble} house of Commons therein named a Commissioner) that business (by reason of strong opposition) continued many moneths, and was not ended till very neere the time of the battaile at Edgehill.

"And before yo^r Pet^r could conveniently returne to London, the King came from Edgehill to Oxford. At which time yo^r Pet^r left the place of his habitation, and almost all his goods, to the spoile, and (within a short space after) was brought a prisoner to Oxford. And after hee had there given 2,000^l. baile with two sureties, he was taken from the cheife Justices chamber, carried to prison againe, had his money, sword, watch and horses taken from him and continued seven weekes in prison. And during that time his house was taken from him, and a woman put in who kept a taverne and a house of worse fame, who tore his house, burnt great part of the matterials and spoiled and embezzled almost all his goods.

"And upon new baile of 2,000^l., with two other sureties to appeare at the Assises yo^r Pet^r was againe delivered. And the day before the Assises was imprisoned againe, and carried prisoner to Hungerford, with purpose to cause him to forfeit his baile. But (making meanes to have leave to appeare at the Assises) albeit nothing was objected against him, yet was his recognizance continued until the meeting of the Parliament men at Oxford and long after.

"1 Junii, 1644 yo^r Petitioner gott forth of Oxford, and being brought before Sir Will. Waller, who after examination of your Pet^r intreated him courteously and dismissed him. Then yo^r Pet^r (having no meanes to maintaine himselfe) went to Combe in Hampshire, and lived with his brother (who had served at Edgehill for the Parliament) untill his said brother was carried away Prisoner to Winchester.

"And then yo^r Pet^r came to another brother's house at Whitechurch within foure miles of Reading, where he continued sick for some time untill he came to London and voluntarily submitted himselfe to M^r. Speaker, from whom he stands referred unto yo^r grave wisdom and consideration.

"Most humbly referreth himselfe unto yo^r goodness and mercy.

"And yo^r Pet^r, &c.,
(S^d.) "JOHN WHISTLER.

"1 Novem."

His estate is returned as consisting of lands in Great and Little Haseley, co. Oxon, worth about 74^l. per annum, a messuage lately burnt, and lands in Eton, co. Berks, worth about 58^l. per annum, &c.; but "By reason of the double contribution none of this hath yielded any profit these 3 yeeres."

NOTES OF TRAVEL.

WITH reference to the interest that is now felt in all that can be learnt respecting the great river Congo, we hear that a very important work by Captain R. F. Burton, containing a history of Congo and an account of all that is known of the river from the days of Diego Cam to recent times has been, for upwards of a year, in the hands of Mr. Tinsley. We are at a loss to understand why there should have been so long a delay in the publication of a work of such great geographical importance, especially at the present moment.

It will be remembered that Captain Burton visited the Congo in 1863, and ascended the river as far as the Yellala Falls; so that he combines personal knowledge with that rare geographical erudition, in which the discoverer of Lake Tanganyika has few living rivals.

We understand that Mrs. Richard Burton's new work, entitled *The Inner Life of Syria; or, Benoni the Child of My Sorrow*, is about to be published. This work contains an account of the habits and customs of the harim, and also enters upon the kind of life that an English woman may make for herself who takes up her abode in the East. The residence of the wife of the great traveller for two years in Damascus, and her knowledge of Arabic, are excellent guarantees for the value of anything she may write on the East.

MR. H. F. BLANFORD has just returned to India as head of the Meteorological Department. The great want has long been a central leader and organiser of the observations in the different provinces, through whom uniformity might be secured, and to whom the results might be referred and worked out. This essential to useful meteorological work in India has now been conceded, and real progress may be confidently anticipated from Mr. Blanford's appointment. The requirements of meteorology have too long been neglected, and we rejoice to find that the Government of India have at last taken a step which shows that their importance is appreciated.

MR. J. C. HANNINGTON, of the Madras Civil Service, explored a portion of the Anamallay hills last April. His report is a valuable addition to the little that was previously known of a range which has been recently found, in the course of the operations of the Great Trigonometrical Survey, to contain the loftiest peak in India south of the Himalayas. He roughly surveyed the portion of the hill range which he visited, and his map has been photo-lithographed at the office of the Superintendent of Madras Revenue Surveys, on a scale of two miles to an inch. Mr. Hannington also made six photographs which show the magnificent scenery of these hills.

THE Hydrographer is about to publish a portion of the circumpolar chart on a large scale, including the American side and all the English discoveries, and extending so as to take in the whole of the 80th parallel. This publication will be very opportune at the present time; and will be most useful to all who are interested in the Arctic expedition, as a help to the following any discussions that may arise hereafter, and to the comprehension of the scope and objects of the exploring operations.

News has recently been received of the European

colonists who have settled in the valleys on the eastern slopes of the Peruvian Andes. There is a German colony on the Pozuza, near the fort on the Mazru, which is the nearest navigable point to Lima, on a tributary of the Amazon. The French colonists are on the Chanchamaza, which is nearer to Lima, but at a greater distance from a navigable point. There are also some Italian colonists. These small nuclei of future thriving communities are planted so as to command the principal routes leading to the navigable rivers which will render the Amazon valley hereafter a network of fluvial highways of commerce.

DR. ANDREAS, Professor of Sanskrit and Comparative Philology at the University of Kiel, is about to start for Persepolis (*via* Russia) in order to copy Cuneiform and Pahlavi inscriptions to be found in that part of Persia. He will meet Dr. Stolze, the photographer of the Prussian astronomical expedition, at Ispahan, who will assist him by taking photographs of the monuments as well as of the inscriptions. The Prussian Government and the Academy of Berlin fixed 10,000 thalers for this expedition, a sum which certainly cannot suffice if Dr. Andreas, as we hope, tries to make excavations and also to investigate difficult geographical questions, such as the situation of the famous town Istakhar, the birth-place of the Arabic geographer Istakhri.

THE United States Topographical and Geographical Survey of the Colorado Valley have brought home a striking series of photographs of rock scenery. The precipices which wall in the Colorado river and its tributaries extend for hundreds of miles, in many places bearing comparison with the stupendous mountain-wall of the Jungfrau as seen from Mürren. Like much of Mexico, the table-land of Colorado is not traversed by wide and gently shelving river valleys, but is gashed by huge rifts or cañons, with rocky sides so steep that a stone may often be flung to fall clear thousands of feet into the roaring stream below. The walls of Grand Cañon, at one place here photographed, are over 6,000 feet high, only receding in rough steps from the perpendicular. A desolate stretch of rock and river, with the remains of two or three abandoned boats, is where the explorers, after a boat-journey of 1,000 miles through a series of cañons, came upon the traces of another party whose fate we are left to conjecture. Few regions of the earth can surpass this land of cañons for wild grandeur and horrible desolation. The scanty tribes of natives are of the usual North American type in complexion, and make a well-shaped and bold-featured race, with the somewhat sullen expression which belongs to a life of much privation and solitude. Their portraits taken on this expedition are of remarkable excellence, and copies should be procured for ethnological collections. The set of photographs is published by J. F. Jarvis, 479 Pennsylvania Avenue, Washington.

THE *Boston Independent* gives the following results attained by the American Palestine Exploration Society during the present year:—

"An expedition conducted this last summer by Professor J. A. Paine, of this Society, appears to have produced larger results in the identification of Bible sites than any other since Dr. Robinson's first journey through Palestine. With as small a party as possible, comprising only an interpreter, a cook, and three muleteers, and avoiding with the utmost care all display, Professor Paine spent nine weeks going forward and backward over the whole land of Gilead, a region almost utterly unvisited by previous travellers, examining every point of any possible archaeological interest. It was not an easy trip nor a safe one, and more than once was the explorer's life in imminent danger from the Arabs, who were quite unfriendly; but the numerous places of interest to be searched for made it worth while to run considerable risk of life.

"The main summit of Mount Gilead itself, called Jaila, he carefully examined, and found on it scattered remains of the old cypress forest, which he was told had been finally destroyed within a few years by those

who had cut down the trees for the purpose of distilling from the wood in the form of a tar the resin which exudes in great abundance from it. He found remains of the kilns that were used for this purpose. This tar or resin is used as a salve or ointment, mainly for cattle, and is with little doubt the Balm of Gilead. Ashteroth-Karnaim, or Ashteroth of the two peaks, where the Rephaim dwelt in the time of Chedorlaomer, is identified on the eastern border of Gilead with extensive ruins of immense basaltic blocks on a double ridge called El Birah, in front of which lies the plain of Asherah, as that portion of the Zerga bottom is called. In the vicinity of Mount Gilead, Mizpeh of Jephthah and Mizpeh of Gilead, Pella (Bellila), and Dathema, or Dium (Dahama) may be added.

"The Jabbok River Professor Paine fails to identify, as other writers have done, with the Zerga, as there is nothing in the region to correspond with Mahanaim, Betonim, and Penuel. He, therefore, was compelled to identify it with the Wady Yabis, about thirteen miles further north. On a tributary of the Yabis, in its upper portion, was found a ruin, Mahana, corresponding in name and position to Mahanaim. Tishbi, the home of Elijah, appears to be Listib, overhung by a monastery, which bears the name of Mar Ilyas, St. Elijah. An old Roman road from Mahana goes north-westward to the only ford of the Yabis along the way taken by Jacob after Laban had left him and when he went to meet his brother Esau. A short distance across the ford Kefr-Abil must be the Penuel that Jacob reached at sunrise, after wrestling with the angel. The Seir of the narrative, to which Jacob sent to find Esau, can hardly be Mount Seir, and may have been in the vicinity of the ruin Khirbet Sir, within sight of Penuel. We might also mention that Tabbaqat Fahil (Robinson's suggested Pella) is probably Succoth; Qurqama is Karkor; Mahathah is Abel Meholah; Taibeh is Debir; Tuba is Tabbah; that Shabeh is Shaveh or the King's Dale; and that Afena is Rafena of the Decapolis. Among the places identified south of Gilead may be mentioned Jaazer (Yajuz) and Jogbehah (Jubaiyah). Including sites mentioned in the Bible, the Apocrypha, and Josephus, about forty places in all have been identified more or less certainly, making a brilliant contribution to sacred archaeology."

CAPTAIN GIACOMO MERELLO, of the Genoa Rubattino Company, has recently published a pamphlet in which he expounds at length the details of a new route from Bombay to Aden during the south-west monsoon months. Instead of following the course to the south, laid down in Taylor's chart of the Arabian Sea, Merello turned his vessel's head northward, and by tacking got within 100 miles of the Arabian Coast, from whence he made direct for Aden and arrived thither in ten days' time. This he claims as a great discovery, inasmuch as it is only 45 miles longer than the direct line, whereas the southern route is 485 miles longer. But as a matter of fact, the route adverted to has been known and often followed during the last fifteen years by the Peninsular and Oriental Company's steamers. It is not invariably adhered to, however, as the greater force of the monsoon in those more northern latitudes means a larger consumption of coal, more wear and tear to the vessel, and slower progress. Were these points more fully considered in Captain Merello's pamphlet, the advantages of his route would not appear so striking.

GUIDO CORA's *Cosmos* contains an important map of Makran, and the frontier between Persia and Baluchistan, compiled from a recent map by Major St. John and the Admiralty chart. The surveys of Majors St. John and Lovett are embodied, as well as the routes of Sir F. Goldsmid and Mr. Blanford; and as this is the first time that the geographical results of these officers' labours have been thus presented to the public, the map will be looked upon with interest. The article written to accompany the map will appear in the next number of Signor Cora's periodical.

THE Russian expedition which is about to explore Western China has reached Shanghai, *via* Kiachta and Peking, after procuring the necessary passports at the latter place. The party consists

of Captain Sosnovsky, of the General Staff, Captain Matoosovsky, a doctor, a photographer, three Cossacks, and two interpreters. They were to leave at once by steamer for Hankow, whence they will proceed in native boats up the river Han in a westerly direction.

PARIS LETTER.

Paris: Dec. 25, 1874.

I should not be giving a faithful review of the literary movement in Paris if I passed over in silence the publication of Christmas books. The new year is of considerable importance in literary life in France. Some of our first publishers await its advent to issue works which combine high intrinsic value with typographical splendour and magnificent illustrations. I mentioned in my last letter Jules Quicherat's *History of Costume* (Hachette). The same house has just published a volume entitled *The India of the Rajahs*, by M. L. Rousselet, which is distinguished not only by the admirable drawings accompanying the text, but also by the text itself, a tale of travel full of life and talent. Among M. Firmin Didot's publications, M. P. Lacroix (bibliophile Jacob) adds a volume to the splendid series in which he is bringing before us the manners of ancient France. This volume, entitled *The Eighteenth Century, Institutions, Manners, Customs*, is a continuation of the books on *Military and Religious Life in the Middle Ages* and *at the Period of the Renaissance*, on *Manners, Customs, and Costumes of the Middle Ages*, and *The Arts in the Middle Ages*. These works place before the reader's eyes by means of chromolithography and engraving, reproductions of a multitude of ancient objects, miniatures, monuments of every kind, sculptures, and paintings; while the explanatory text is the work of a man whose learning, though undeniably great, is yet unfortunately unsound. His numerous writings all bear the traces of a certain haste and of a negligence more to be regretted in historical investigations than in any other sphere. Besides, instead of giving his books that character of impartiality which might so easily have been preserved, he has preferred to earn a cheap success from the Catholic public by flattering their prejudices with apologies as misplaced as they are inconclusive with regard to the least justifiable sides of the Middle Ages, especially the Inquisition and religious persecutions generally.

Besides these works, whose object is to make ancient France known to us by pictorial illustrations, M. Firmin Didot had undertaken the publication of a series of texts of the literary masterpieces of the Middle Ages. He had entrusted it to M. Léon Gautier, Professor at the Ecole des Chartes, known by his history of epic poetry in France, entitled *Les Epôques de la France*, and by his edition of the *Chanson de Roland*. M. Gautier is, if not one of the men who know our Middle Ages the best, at least one of those who love them most. He studies them with the zeal of an ardent historian, and admires them with the fervour of an earnest Catholic. This somewhat artless admiration imparts a warmth to his style which communicates itself to his readers, and supports him under the considerable labour involved in his threefold occupation as professor, journalist, and literary historian. We expected from him for the present year a *Chrestomathy of French Literature in the Middle Ages*, which was to form the third volume of the "Collection of Masterpieces of the Middle Ages." The two first volumes contained the *Chronicles of Villehardouin and Joinville*, restored for the first time to their authentic form by M. Natalis de Wailly, published in a critical text, and accompanied by an introduction and notes of high value. After M. Gautier's *Chrestomathy*, for which he had already collected mountains of texts, and to which he was to add a Glossary of Old French, a history of miniature-painting and writing, &c., &c., we were promised a selection of mediæval dramas, an edition of Comines by

M. P. Violette, and several other historical or poetical works. But, unfortunately, M. Gautier has had a difficulty with his publisher, and this great and interesting enterprise has for the present collapsed. Let us hope that the collapse is only temporary, and that this attempt to spread through the mass of cultivated men the most remarkable literary works of the Middle Ages will be soon resumed.

M. Firmin has taken Christian antiquities as well as the Middle Ages for the subject of his publications. Dom Guéranger, a Benedictine monk of the Abbey of Solesmes, one of the few members of the regular clergy who have preserved the traditions of the learned monks of the seventeenth and eighteenth centuries, and who is better versed than any other Frenchman in the knowledge of ancient liturgies, has published, under the title of *Saint Cecilia and Roman Society in the First Two Centuries*, a kind of summary of the works of M. de Rossi on Christian Rome in the primitive times. This year a member of the militant Catholic press, and the most violent of all, M. L. Veuillot, has been commissioned to write a kind of history of Christianity, entitled *Jésus Christ*, and accompanied by a study on Christian Art by M. E. Cartier. But though M. Veuillot is one of the most remarkable polemicists ever produced by the French press, though he deserves to be called a great writer in this class of literature, though his name has been sometimes mentioned as one of those worthy of figuring among the Forty Immortals of the French Academy—unfortunately he loses almost all his good qualities when he has no one to attack or to abuse. His *Jésus Christ* will add nothing to his reputation, nor the labours of M. Cartier on Christian Art to our knowledge.

In short, this season appears less rich in remarkable Christmas books than the last. But the most noteworthy point is the more and more clearly marked taste of the public for serious books. Even amusement tries to be instructive, as proved by the charming books comprised in Hetzel's "Library of Education and Recreation"—among others, the novels and romances of Jules Verne, Erckmann-Chatrian, Lucien Biart, Stahl (a pseudonym of M. Hetzel himself); as proved also by the "Library of Marvels" published under the superintendence of M. Chardon by Messrs. Hachette, in which we have the history of all arts, all sciences, and all industries.

Another of these gift-books combining instruction and amusement has just been published by M. Charles Blanc, the well-known director of the great publication on the *History of Painters*, and Director of Fine Arts under the presidency of M. Thiers. M. Charles Blanc had already given us a *Grammar of the Arts of Design*, which is one of the few good books on this delicate matter. He has just applied his principles to a very limited but very piquant subject—*Art in Women's Dresses and Ornament* (Raynouard). M. Charles Blanc will doubtless be accused of pedantry and presumption; it will be found that he treats very gravely of these trifling matters, and it will certainly be said that any Parisian lady has a better knowledge of the subject in her own frivolous head than the whole venerable tribunal sitting at the Academy of Fine Arts. True; yet M. Charles Blanc's book is full of subtle observations and useful advice, at once lofty in tone and practical in bearing, on the cut and the lines of the dress, and the harmony of its colours; and those who have constant opportunities of seeing the costumes, and especially the hats, of the ladies of Paris, will find it by no means superfluous to invite them to "bring art to bear upon their dresses and their ornaments." M. Charles Blanc, too, is a writer of talent, though he has not the ample and nervous style of his brother Louis Blanc; and he would have filled to perfection the post of Secretary to the Academy of Fine Arts, from which he was excluded by reasons political, rather than literary or artistic.

M. Charles Clément has just published a book of the greatest interest on *Léopold Robert, his Life and Works*; a complete and excellent monograph, written with talent and feeling, worthy of those which he has before given us on Géricault and Prudhon. M. Clément makes us esteem and love the unhappy artist, whose talent in execution always remained so inferior to his ideal conception, and who at last found existence a burden too heavy to bear. There is this bond of union between the three painters whose life M. Clément has written and whose work he has analysed—that all three were unfortunate, that all three had an original and personal idea, and that all three in their short and painful lives were able to express but very imperfectly this ideal which was in them. There is yet a fourth, who in certain respects may be placed beside them—Gleyre, who died suddenly last year; a great artist too, whose works are far from rendering fully his noble aspirations. M. Clément has inherited drawings by him, the most interesting portion, perhaps, of what he has left, and that which gives us the most complete revelation of him, and he is preparing to raise in honour of his friend a monument like those which he has devoted to Léopold Robert, to Prudhon, and to Géricault.

I will only add, in conclusion, that English works hold a prominent place among French Christmas books, particularly tales of travel, such as those of Wyville Thomson, Stanley, and Wymper. G. MONOD.

EXPLORATION IN PARAGUAY.

Asuncion : Nov. 24, 1874.

It would take too long to tell you of the months of revolution, changes of government and vexatious delays of the *Mañana* system which ultimately broke up our commission. We found Paraguay ruined and bankrupt, degraded materially and morally to an extent which can hardly be believed. It was not until after the Brazilians, who now virtually rule the country, had interfered to save the remnant of the Paraguayans from themselves, that it was possible to go beyond the dilapidated streets of Asuncion. The policy of Brazil seems to be to maintain Paraguay in a nominal independence, using the country as a buffer between the Empire and the Argentine Republic; but at the same time it is accumulating over it a load of debts and obligations from which Paraguay will never be able to shake itself free, and the garrison of 3,000 or 4,000 men in Asuncion is amply sufficient to ensure that the country will never again think differently from Brazil.

Giving up hope of the promised assistance from the Government, but very unwilling to return without seeing something of the country, I made a rapid journey with one companion southwards across the Tebicuari, the largest interior river of Paraguay, and down into the deserted lowlands of the Misiones, round the wide forests and wider marshes, reaching the Paraná at Encarnacion, and crossing the great river to the Correntine village of Ytapua. The massive barn-like churches, empty college squares and rows of doorless houses of the old Jesuit foundations alone remain to indicate the former prosperity of this part of Paraguay; all the less substantial farm-houses of the times immediately preceding the great war have fallen from decay—their sites only being marked by orange groves yellow with ripe unplucked fruit. In a few mud ranchos, often a league or two apart, some old women (for there is scarcely a man left in this part of the country) drag out a miserable existence, living on oranges and mandioca. The whole of the country south of the Tebicuari, with the exception of about fifty square miles, which belong to our countryman Dr. Stuart, and another smaller property, is government land; the central portion between Asuncion and Villa Rica, on the other hand, is almost all privately owned. Of the southern tract, about one-fourth, at a rough guess, is

covered with dense low-lying forest, another fourth with unprofitable marsh, and the remaining half is under coarse grass pasture, almost too rank for cattle.

Returning to Asuncion, we found that the Boundary Commission, which has been employed for the past two years in marking out and surveying the new line of demarcation between Brazil and Paraguay, had returned for fresh supplies, and was about to start for a final campaign in the Cordilleras. As this afforded an opportunity of seeing a portion of the country which could not be easily reached otherwise, I applied for and obtained permission to accompany the expedition.

The Commission consists of three or four Brazilian officers with about forty men, and a Paraguayan section—a captain with ten boy soldiers. The Brazilians have done all the work and provide the stores, the Paraguayans look on at a respectful distance and sign their names when required. The boundary line decided by treaty follows the river Apa from its mouth in the Paraguay to its source, and thence the summit of the Cordillera to the great waterfall of the Paraná, the Salto Guayrá, or Siete Quedas of the Brazilians. By far the most laborious work of the Commission was in cutting a path of forty leagues in length through the forests south of the base of the river Icatimí to the great Salto, precisely on the water-parting. This path, though only wide enough to allow laden mules to pass, required six months in cutting, and during the time the Commission suffered much from continual rains, losing many animals, since the only food to be found for them in the forest was the succulent topmost leaves of the palms. The boundary is marked by six columns placed at important points along the line from the mouth of the Apa to where one of the high islands in the middle of the Paraná fall is considered a sufficient natural mark for its termination. The work of surveying the boundary and of placing the corner marks had been accomplished in former expeditions of the Commission; all that remained to be done in this one was to build the three central columns.

We left Asuncion three months ago, going up the river by steamer to Concepcion. The most considerable village of Northern Paraguay, with about 600 inhabitants, it is the reputed great seat of export for the northern *yerbales*; the trade, however, seems to be almost at a standstill. A few hides of the maté tea, indeed, are piled beside the ruinous custom house, but they appear to enjoy undisturbed repose, waiting, perhaps, for the complete recovery of the old canoe, which is chronically being mended on the river bank beside them. From Concepcion north-eastward to the Apa, the country may be described as a succession of wide open camps, separated by low wooded ridges, each grass plain having a stream flowing westward in its lowest central level, along the banks of which strips of wood extend; but the trees are disappointingly small and matted together by underwood and trailing creepers. The most considerable river crossed was the Aquidaban, rapid throughout its course, rising and falling almost suddenly after rain. The Apa was reached at the pass marked by the fire-blackened posts of the old military station of Bellavista, and a short way above this the two chief head-streams of the river unite: the one coming from the north-east is, according to the Paraguayans, the true Apa, and it bears this name; but the other, the Estrella, flowing from south-east, was judged by the Brazilian surveyors to bring a greater quantity of water to the river, and as it has about the same length as the north-eastern tributary, it was decided by them to be the true source of the river, and consequently the boundary. This decision, which adds a few hundred square miles more to Matto Grosso, naturally gave rise to opposition and protest on the part of Paraguay, but the objections were overruled. At the mouth of the Estrella a boundary mark was accordingly built.

From this point our way, along the only track which has yet been opened, led through the southern border of Matto Grosso, across the minor northern tributaries of the Apa to its source in the Cordillera, over undulating and beautiful country, with rather more grass than wood. The name Cordillera is altogether misapplied to the heights which separate the waters flowing to the Paraguay river on the one side, and to the Paraná on the other in the north of the country, for they are evidently a continuation of the great Brazilian table land; between Concepcion and the central Apa the rise is very gradual, and there is no appreciable ascent until about midway between Bellavista and the source of the Apa, where a steep slope of a few hundred feet leads up to the undulating top of the plateau. The highest part of all does not much exceed 2,000 feet above the sea. On the other hand, the water-parting is most distinctly marked and uniform. In the space between the sources of the Apa and Estrella it is a grassy ridge, from half a mile to a mile in breadth, descending very gently to right and left. The sources occur at short intervals, each having its marsh, forming a crescent of rich green, half circling a rounded head of woods, which follow down its banks and mark its course away into the distance.

To the geologist, perhaps the most interesting feature of this part of the country would be found in the pebble beds, which are seen in every section from that of the river bank of Concepcion, right up to the summits of the table land; on the water-parting ridge they lie in great mounds.

Another boundary column was built at the sources of the Estrella, but under the greatest difficulties, for the northerly and southerly currents of air seemed to have chosen this spot as their battle-field, contending in furious thunderstorms. One of these storms, more violent than usual, threw down the first mark as soon as it was built, and a second had scarcely been completed when a *tormenta*, accompanied with large hailstones, coming on at night, levelled our tents and made the column a heap also. For us, however, the rain was far preferable to fair weather; for as soon as it ceased we were beset with clouds of little stinging flies, bred in the marshes of the double line of sources. Each one in biting left a blood-blister on the hand or face; the horses and mules, tortured to madness by them, would break from their halters and run off in any direction to be free of the plague. This pest of flies afterwards became so bad that the hands and face swelled up from the irritation of their bites, and on fair days nothing could be done but to pray for sunset, since at that time they retired, giving way to the almost welcome ping of the ordinary mosquito.

Not far from the Estrella source is the Brazilian military colony of the Upper Dourado (tributary of the Paraná), a solitary little village of mud ranchos, where a *comandante* spends an exiled life with thirty negro soldiers. Though it has been established for some years, the colony is without cultivation of any sort.

Our next move was southward to an open space on the water-parting, called the Potrero de Julio, where the sources of the river Ipané flowing westward, and of the Amambaya eastward, divide, the latter river giving its name to the heights. Here the final boundary column was placed. A few leagues south of this, the forest path, which was cut by the Commission to the Great Salto of the Paraná, begins, and the Paraguayan leader was good enough to act as guide for me to the entrance of it.

We found it with some difficulty, for camp fires and new growth had already altered the aspect of the edge of the forest. The narrow path was also much obstructed by the rapidly growing vines and by trees fallen across it. For the first time in this journey the timber was really fine, tall massive trunks rising from the underwood. Our farthest point in the *picado* was an old encampment of the

Commissioners, where they had been met in the first journey by the so-called general of the Canguá Indians, who had come in the name of his chief with forty chosen bowmen to know the intentions of the Commission and why they were cutting paths which might admit enemies to their solitudes.

I would fain have gone forward to the Great Salto, but it was impossible without a considerable escort and full supplies, neither of which could be had. Great things are told of this second Niagara, of the sound of its volumes of water heard at four leagues distance, and of the clouds of spray and magnificent rainbows amidst which it rolls into the deep narrow gorge below. The Indians fear to approach the fall, considering it the very gate of the infernal regions.

Our return track from the Potrero de Julio towards Concepcion was of peculiar interest, for it followed the very line of Lopez' last march from his camp at Panadero to that in the wilds of Cerro Cora, where he was killed four years ago. The track tells too plainly of the miseries which accompanied this final retreat of his army, for all along it at little intervals lie the unburied and undisturbed skeletons of men who had lain down to die of weariness and starvation almost within sight of one another. Every little shade-tree along the path has its heap of bones beneath it, sometimes with the rusty gun or sword, or weathered saddle lying beside. After some distance the track descends the edge of the plateau, passing through the great Yerbal of Chirigué, which is said to yield the finest maté, but has never been worked on account of its remote position. A fine forest succeeds on the lower slope, and from this one emerges suddenly into the splendid amphitheatre of Cerro Cora, wild and beautiful in the extreme. The cerros forming it are detached portions of the high land encircling a lateral valley of the Aquidaban, through which the arroyo of Chirigué flows; they have been worn by some geological forces into the most fantastic shapes, cones and cliffs and castellated towers. Excepting on their precipitous sides of red sandstone, the hills are densely covered up the sides, over the tops, and saddles between them with rich dark forest, while lighter groves of feathery palms extend round the undulations below, leaving little grassy knolls here and there. On one of these open spaces in the middle of the circle, Lopez's last encampment was pitched, sloping to the Chirigué at about half a mile from where it joins the Aquidaban. A more secure hiding-place than this could hardly be conceived, for only one pass of the Aquidaban is practicable from the westward. Lopez had placed cannon to guard this pass and one beyond it, but, strange to say, neither fort gave warning when the Brazilian horsemen approached. The camp remains as it was suddenly left: the wrecks of baggage carts and store-boxes, broken arms, ammunition and gun-carriages are thickly strewn about; bones of men, too, lie scattered in great numbers.

The accounts of Lopez's death are very varied. His admirers—for there are still some Paraguayans who half worship this little Nero—make him ride out from his tent alone when surprised, bidding his followers save themselves, and fall, after killing a dozen or so of his enemies and refusing quarter, with a magnificent speech about his country's liberty and his own pleasure in dying for it, on his lips. The more common story represents him shuffling off the scene on foot, making for a path which led to one of the cerros, but only to be caught and spitted through by a Brazilian lance, dying thus without saying anything pleasant to remember or repeat. A wooden cross was originally set up over his grave, but this has now disappeared, and a bush, like other bushes dotted about, was pointed out to me as being over the place. Cerro Cora is said to be a chief stronghold of the Canguá Indians; we met only one party of them. They came down to the track to barter wax in cakes for farina and tobacco. The men

were of medium height, the women rather short, with dark yellow-brown skin and black hair falling over the brow and long behind. The face is oval and beardless, with high cheek-bones, the eyes almond-shaped and turned up at the outer angles, the mouth strongly curved downwards—altogether very Mongolian in type but for the nose, which is large and has a decidedly Roman bridge. A spike of an amber-like substance, two or three inches in length, with a cross head, is pushed through a slit in the lower lip of the men. Their language is the ordinary Guarani, but without the great intermixture of Spanish words used in the more civilised parts of the country. Though they carry formidable bows or iron-shod spears, yet they are by all accounts a very mild and inoffensive tribe, keeping closely to their forests, and taking pains to conceal their dwellings.

We made hurried night and day marches to reach the lower pass of the Aquidaban before the rain, which threatened, should fall to swell the river. As it was we passed the ford in a thunder storm, and next day the river had risen to such an extent that the expedition was cut in two by it, the carts coming in the rear being unable to pass the torrent till the week after.

Arrived again at Concepcion, I hoped to go back overland to Asuncion, but we learnt that the whole country between this place and San Pedro, the chief village of the department south of this one, is overrun by Chaco Indians, of the Lengua tribe, who have taken advantage of the weakness of the country to cross over the river to its more habitable side. Ninety-six families are said to have been driven inland from their homes by their invaders, and for the present all communication between the northern towns is closed.

CORRESPONDENCE.

M. HALÉVY AND THE ACCADIAN LANGUAGE.

Oxford: Dec. 23, 1875.

I hardly think that Assyrian scholars will care to answer M. Halévy's last paradox as anticipated in Saturday's ACADEMY. It is impossible to carry on an argument where there is no common basis upon which to build it; and just as the astronomer would consider it a waste of time seriously to combat the arguments of a resuscitated Ptolemaean, or the Sanskritist to oppose the theory that Sanskrit was a language invented to deceive European students, so the Assyriologue has some-

thing better to do than to occupy himself with M. Halévy's hypothesis. It must be remembered that it is not the modern Assyriologue, but the scribes of Assur-bani-pal, who have made out the Accadian to be a non-Semitic agglutinative language, and the first few pages of the second volume of the lithographed *Inscriptions of Western Asia* would soon have convinced M. Halévy—had he been able to read them—that his new paradox must share the fate of his former one on the interpretation of the Kypriote inscriptions. I need scarcely say that his arguments are specious to the "unlearned" only. Thus, a reference to my article on the Accadian numerals in the *Zeitschrift d. M. G.* will show that the pronunciation of others of them is certain besides that of *me*, "one hundred," and that so far from the latter being a Semitic word, it supplies us with the long-wanted etymology of the Semitic numeral. The Accadian word properly signifies "multitude," and enters into the composition of *mes*, "many," and other words; and after being used to denote "one hundred," was borrowed in this sense by the Assyrians. So, again, *gar* is by no means the most usual relative pronoun, while the ordinary way of expressing the relative sentence is by means of the participial affix *d*. One of the copulative conjunctions, it is true, is *vā*, but it is prefixed to the word which it follows in most other languages; while the reflexive pronoun is not *im* but *im-te*, formed from *im*, "wind" or "breath" (not "glory"!); and the common post-position *te*. In fact, the use of postpositions is one of the characteristics of Accadian, and who ever heard of postpositions in Semitic! But enough of this: M. Halévy has been laughing at us in his sleeve, and I will not take up the space of the ACADEMY by any further remarks on his bold and ingenious paradox. A. H. SAYCE.

A PASSAGE IN HAMLET.

28, Craven Hill Gardens, Hyde Park, W.:
December 29, 1874.

I trust there is not much divergence of opinion between Mr. Furnivall and me. When I preferred the gathering of materials to comment, I only meant to contrast mere comment in the air, based upon imaginary facts or unreasoned feelings, with real and solid knowledge. The gathering of materials is imperfect, unless accompanied with so much comment as shows their relevancy to the matter in hand. And I class Mr. Fleay's, and Dr. Ingram's, and Mr. Spedding's contributions among materials rather than among comments. They are collections of facts so classified as to admit of their being generalized into laws.

As to the special matter in controversy, I have proved Hamlet's line, "the croaking raven doth bellow for revenge," to be a parody of lines in the old *Richard III.* Mr. Furnivall says this is no proof that the line is not taken from the unknown old *Hamlet*. I am not careful to contradict him. An assertion concerning an unknown matter is a dogma incapable either of proof or disproof. I only submit that if the line is drawn from one source, it is needless to assign it a second origin. I also fail to see how Hamlet's allusion to the old *Richard III.* proves that "his father's ghost was then in his mind." Will Mr. Furnivall excuse me if I repeat that this is one of those baseless comments which I should like to see postponed in favour of laying down a good basis of fact?

RICHARD SIMPSON.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Jan. 2, 1875. 3 p.m. Royal Institution: Juvenile Lecture.
MONDAY, Jan. 4, 7 p.m. Entomological.
8 p.m. British Architects. Medical.
TUESDAY, Jan. 5, 3 p.m. Royal Institution: Juvenile Lecture.
5 p.m. Musical Association: Mr. J. Baillie Hamilton on "The Application of Wind to String Instruments."

TUESDAY, Jan. 5, 7 p.m. Sculptors of England.
8 p.m. Pathological: Anniversary.
8.30 p.m. Biblical Archaeology: "Annals of the Ethiopian Dynasty in Egypt," trans. Prof. Maspero; Dr. Birch on "Some Cypriote Antiquities discovered by Gen. Di Cesnola."
8.30 p.m. Zoological.
WEDNESDAY, Jan. 6, 8 p.m. Microscopical. Obstetrical: Anniversary.
THURSDAY, Jan. 7, 3 p.m. Royal Institution: Juvenile Lecture.
8.30 p.m. Royal.
FRIDAY, JAN. 8, 7 p.m. Literary and Artistic.
7.30 p.m. Anthropological: Anniversary.
7.30 p.m. Sacred Harmonic Society (Exeter Hall): Creation.
8 p.m. Astronomical. Quekett Club.
8 p.m. New Shakspeare Society: Dr. E. A. Abbott on "The first two Quartos of *Hamlet*, 1603, 1604."
8.30 p.m. Clinical: Anniversary.

SCIENCE.

Anthropogenie. Entwicklungsgeschichte des Menschen. Von Ernst Haeckel. Zweite Auflage. (Leipzig: Engelmann, 1874.)

OCTOBER 1, 1859, the date of the publication of the *Origin of Species*, will hereafter be reckoned as the commencement of a new era in the history of Biology. It marks the Hegira of Science from the idolatries of special creation to the purer faith of Evolution. That great conception, which had dawned upon the minds of the patriarchs of philosophy—which had been embalmed in the immortal poem of Lucretius—which had been submerged, but not drowned, in the muddy deluge of Hebrew mythology and schoolmen's philosophy (miscalled Christianity) in the Middle Ages—and had struggled to the surface, much besmirched, by Lamarck's help—at length stood upon a firm dry quay, built by Darwin's hand, and made watertight by a goodly contribution of Wallace's cement.

For the first time in history, sound scientific reasonings—the force of which has increased with every year of the fifteen which have elapsed—introduced such conclusions as the following:—

"I believe that animals have descended from at most only four or five progenitors" (*Origin of Species*, 1st edition, p. 484).

"I should infer from analogy that probably all the organic beings which have ever lived on this earth have descended from some one primordial form" (*Ibid.*, p. 484).

"In the distant future I see open fields for far more important researches. Psychology will be based on a new foundation, that of the necessary acquirement of each mental power and capacity by gradation. Light will be thrown upon the origin of man and his history" (*Ibid.*, p. 488).

"I view all beings, not as special creations, but as the lineal descendants of some few beings which lived long before the first bed of the Silurian system was deposited. . . ." (*Ibid.*, p. 488-9).

"As all the living forms of life are the lineal descendants of those which lived long before the Silurian epoch. . . ." (*Ibid.*, p. 489).

"There is grandeur in this view of life, with its several powers, having been originally breathed into a few forms or into one" (*Ibid.*, p. 490).

There is no uncertain utterance here. There has been no special creation. All beings which now live are descended from primordial forms which existed before the oldest fossiliferous rocks were deposited. Man is no exception, but he and his highest faculties are as much products of evolution as the humblest plant, or the lowest worm.

A more clear and bold statement of the scope and tendencies of the doctrine advo-

cated by Mr. Darwin could not have been put into words; and those who recollect the somewhat fiery controversies which were carried on during the years which immediately followed 1859, need not be reminded, that the *cheval de bataille* of the opponents of Darwinism was to hold up to scorn and ridicule the application of his views to man, so distinctly indicated by the author of the theory when it was promulgated.

It seems almost absurd to produce evidence of what is so notorious. Yet it happens to be worth while to quote an article which appeared in the *Quarterly Review* for July, 1860. It is a production which should be bound up in good stout calf, or better, asses' skin, if such material is to be had, by the curious book-collector, together with Brougham's attack on the undulatory theory of light when it was first propounded by Young, and it is chiefly remarkable for the magisterial airs assumed by a critic so fearfully and wonderfully ignorant of the subject with which he deals that he believes the blood-corpuscles to be produced by evaporation of the blood.* The following extracts will, however, leave no doubt that, even to so unprepared an apprehension, Mr. Darwin's language was plain enough:—

"This is the theory which really pervades the whole volume. Man, beast, creeping thing, and plant of the earth, are all the lineal and direct descendants of some individual *ens*, whose various progeny have been simply modified by the action of natural and ascertainable conditions into the multifarious aspect of life which we see around us" (p. 231).

"If, with Mr. Darwin, to escape the difficulty of supposing the first man at his creation to possess in that framework of his body 'false marks of nourishment from his mother's womb,' with Mr. Darwin you consider him to have been an improved ape" (p. 253).

"First, then, he (Mr. Darwin) not obscurely declares that he applies his scheme of the action of the principle of natural selection to MAN himself, as well as to the animals around him" (p. 257).

Exactly fourteen years after this distinct testimony to the plainness of Mr. Darwin's speech on these matters, last July namely, the very same Review had an article entitled "Primitive Man." Possessed by a blind animosity against all things Darwinian, the writer of this paper outrages decency by insinuations against Mr. George Darwin, well calculated to damage a little-known man with the public, though they sound droll enough to those who are acquainted with my able and excellent friend's somewhat ascetic habits; and, by way of preparation for the attack upon the son, the anonymous Reviewer charges the father with deliberate duplicity:—

"It is one of the calamities of our time and country that unbelievers, instead of, as in France, honestly avowing their sentiments, disguise them by studious reticence—as Mr. Darwin disguised, at first, his views as to the bestiality of man" (l. c. p. 63).

Messieurs the Reviewers, you diametrically contradict one another, and one of you must bear the responsibility of a direct and deliberate untruth: which is it? The one who, writing in July, 1860, said there was

* The passage is worth embalming: "Or what advantage of life could alter the shape of the corpuscles into which the blood can be evaporated?" (l. c., p. 247).

obscurity about Mr. Darwin's views on this matter? Or the one who, writing in July, 1874, accuses him of having at first disguised his views? Settle it between yourselves. It was necessary for me to give an opinion on so delicate a matter, assuredly I could have no ground for hesitation. For, on becoming acquainted with Mr. Darwin's views in 1858, I set myself to enquire, much more seriously than I had done before, whether the hiatus between man and apes, indicated by the Cuvierian classification, and insisted upon by his followers, to the great satisfaction of the opponents of the doctrine of evolution, really had an existence in nature. I came to the conclusion that it had none; I stated the grounds of these conclusions to those who attended my lectures in 1859-60; a battle, which was somewhat notorious in its day, took place at the meeting of the British Association at Oxford in 1860, and I turned upon Mr. Darwin's views of the evolution of man; while, in 1863, I summed up the then state of the question in a little book, entitled *Man's Place in Nature*, which I did its work in several languages beside my own, and is now out of print and gone to the number of forgotten things: which is its proper place, now that Mr. Darwin has had leisure to state his own views more fully, though not more distinctly, than in the *Origin of Species*, in the *Descent of Man*.

Mr. Darwin reticent about his views respecting the origin of man! Why, for years after the publication of the *Origin of Species*, he could not go to a dinner-party without alluding to them; and whether you took up the last number of *Punch*, or the last sermon, the chances were ten to one there was some allusion to the "missing link."

Under these circumstances, the high moral tone assumed by the *Quarterly Reviewer* of him of 1874, I mean—is truly edifying. Joseph Surface could not have done better. Unless I err, he is good enough to include me among the members of that school whose speculations are to bring back along us the gross profligacy of Imperial Rome. This may be doubtful. But what is not doubtful is the fact that misrepresentation and falsification are the favourite weapons of Jesuitical Rome; that anonymous slander is practice and not mere speculation; and that it is a practice, the natural culmination of which is not the profligacy of a Nero or of a Commodus, but the cruel poisonings of the Papal Borgias.

I remember that when, in 1862, I showed the proofs of *Man's Place in Nature* to a cautious and sagacious friend of mine—expert in such matters—he had nothing to say against my arguments, but much to urge against the prudence of publishing them. Doubtless he foresaw that an unscrupulous critic, sheltered by his anonymity, might charge me with advocating the "bestiality of man," and with, thereby, endeavouring to loosen those moral bonds which hold society together. It seemed to me, however, that a man of science has no *raison d'être* at all, unless he is willing to face much greater risks than these for the sake of that which he believes to be true; and, further, that to a man of science such risks do not count for much—that they are by no means so serious as they are to a man of letters, for ex-

ample. Happily, the reputation and real success of a votary of the physical sciences are now wholly independent of the periodicals which are pleased to call themselves "influential organs of public opinion." The only opinion he need care about, if he care for any—and he is all the wiser and happier if he care for none—is that of about a dozen men: two or three in these islands, as many in America, and half-a-dozen on the Continent. If these think well of his work, his reputation is secure from all the attacks of all the able editors of all the "influential organs" put together. So that I do not suppose that Mr. Darwin troubles himself much about this charge of dishonest reticence, which would be so ludicrous if it were not so shameful to its author; and I have thought it worth while to expose its foolish falsity merely in the interests of the honour of English journalism, in the hope of putting a stop to such malpractices, by calling the attention of the public to the most conspicuous lapse from that honour which has happened within my recollection.

The book, the title of which heads this article, Haeckel's *Anthropogenie*, is remarkable in many ways: not least as a milestone, indicating the progress of the application of the theory of Evolution to Man, since Darwin set us all thinking afresh upon that subject.

The position I took up, in 1863, was a very guarded one, as the state of knowledge at that time demanded. All I had to say came to this—If there is reason to believe that the lower animals have come to be what they are, by a process of gradual modification; then, there is nothing in the structure of man to warrant us in denying that he may have come into existence by the gradual modification of a mammal of ape-like organisation. And of the many criticisms with which my little book has been favoured here and abroad, I have met with none which, in the slightest degree, shakes that position.

Professor Haeckel stoops at much higher game. His theme is "Anthropogeny"—the tracing of the actual pedigree of man—from its protoplasmic root, sodden in the mud of seas which existed before the oldest of the fossiliferous rocks were deposited, in those inconceivably ancient days, which for this earth, at any rate, were the real "juventus mundi," to its climax and perfection—say in an anonymous critic of strict orthodoxy and high moral tone.

It need hardly be said, that in dealing with such a problem as this, science rapidly passes beyond the bounds of positively verifiable fact, and enters those of more or less justifiable speculation. But there are very few scientific problems, even of those which have been, and are being, most successfully solved, which have been, or can be, approached in any other way.

Our views respecting the nature of the planets, of the sun and stars, are speculations which are not, and cannot be, directly verified; that great instrument of research, the atomic hypothesis, is a speculation which cannot be directly verified; the statement that an extinct animal, of which we know only the skeleton, and never can know any more, had a heart and lungs, and gave birth to young which were developed in such and such a fashion, may be one which admits of

no reasonable doubt, but it is an unverifiable hypothesis. I may be as sure as I can be of anything, that I had a thought yesterday morning, which I took care neither to utter, nor to write down, but my conviction is an utterly unverifiable hypothesis. So that unverified, and even unverifiable, hypotheses may be great aids to the progress of knowledge—may have a right to be believed with a high degree of assurance. And, therefore, even if it be admitted that the evolution hypothesis is, in great measure, beyond the reach of verification, it by no means follows that it is not true, still less that it is not of the utmost value and importance.

There is evidence which is perfectly satisfactory to competent judges, that we have already learned the actual historical process by which one existing species—the horse—came into existence during the Tertiary epoch. The evidence, based on the analogy of known developmental facts, that a three-toed *Hipparion* form which lived in the Miocene epoch, gave rise, by suppression of the phalanges of its rudimentary toes and some other slight modifications, to the apparently one-toed later Tertiary horse, is as satisfactory to my mind as the evidence, based on the analogy of known structural facts, which leads me to have no doubt that the said extinct *Hipparion* had a simple stomach and a certain kind of heart. If those so-called "Baconian principles," which everybody talks about and nobody dreams of putting into practice, forbid us to draw the one conclusion, they forbid us to draw the other.

The alternative hypotheses are two: either the Deity manifested his power on this earth, in the course of the Miocene epoch, by making the two primitive ancestors of all the horses out of inorganic matter; or something more unlike a horse than a *Hipparion* changed into one. The latter hypothesis is gratuitous and absurd. The former is not in itself absurd; but unless the early chapters of Genesis mean something contrary to what they appear to mean (and one never knows what exegetic ingenuity may make of the "original Hebrew"), it is shockingly heretical, and I hasten to disown it; lest by some such secret connexion as bound Goodwin Sands with Tenterden steeple, it should land me in the cruelties of Caligula, and lead me to violate the precepts of the sagest of physicians, by indulging in Heliogabalian gluttony.

But if the horse really has arisen in this way, what imaginable ground can there be for the enormous and, in that case, highly "un-Baconian" assumption that the deer and the ox and the pig have arisen in any other way? And if there is—not perhaps the complete evidence that we happen to possess in the case of the horse—but still much better evidence than there is for the authenticity and genuineness of the books called by the name of Moses, that these animals have been produced by a similar method, why may not the hypothesis that they have so arisen, take its rank among the probable conclusions of science? Even though it must, in candour, be admitted that, as we cannot live back into the Tertiary epoch and see what went on at that time, the hypothesis must always remain, in the strictest sense of the word, unverifiable.

The fact is, that if the objections which are raised to the general doctrine of Evolution were not theological objections, their utter childishness would be manifest even to the most child-like of believers. But, if the evolution of all living forms, by gradual modification, is an historical fact, why should the attempt to reconstruct the details of that momentous history be regarded as less philosophical or less laudable than the attempt of a Niebuhr, or of a Mommsen, to build up from ruined monuments, fragmentary inscriptions, and obscure and often contradictory texts, a connected and intelligible history of Rome? Active error may advance knowledge in its efforts to establish itself; and nothing is more remarkable than the number of great things, from the discovery of America to that of the antiquity of man, which have been brought about by the attempt to establish erroneous views. But sitting still, and being afraid to stir, for fear of making mistakes, is certain to end in ruin in science as in practical life.

Professor Haeckel is not chargeable with the fault of sitting still, and, it may be, that he moves too quickly now and then. In his book there are some views which I, for one, do not agree with, but as to which it is just as likely I may be wrong as he. I wish he could be persuaded to take a more liberal view of the duration of life on the earth, though he is far less miserly on that point now than when the *Schöpfungsgeschichte*, formerly noticed in the ACADEMY, was published. I might desire that he would not mix up phylogenetic "Stamm-bäume" with objective taxonomy; and I might wish that he would be a little milder with his honest opponents, though I heartily applaud his practice of dealing with critics of the other sort as mere *ferae naturae*.

But when all is said and done in the way of objection, the *Anthropogenie* is a real live book, full of power and genius, and based upon a foundation of practical original work, to which few living men can offer a parallel. If anybody can read it without profiting by the abundant information and fertile suggestions of new lines of thought which it contains, all I can say is, that I envy him; and if anybody can read it without being struck by its clearness and methodical comprehensiveness, and without being convinced that the general line of argument is sound, whatever may be thought of the details, all I can further say is, I do not envy him. I trust that, like the *Schöpfungsgeschichte*, the *Anthropogenie* may speedily find an English translator.

T. H. HUXLEY.

ON THE STAGES OF DEVELOPMENT IN THE FORMATION OF MYTHS.

Über Entwicklungsstufen der Mythenbildung
Von A. Kuhn. (Berlin, 1874.)

WHATEVER Dr. Kuhn writes on Comparative Mythology is welcome. We only wish he would write more. Whether he touches on the general principles of this new science, or unravels and interprets some of the ancient Aryan myths, we always recognise the sure hand of the master, we always learn something new, or receive at least a fresh impulse for further enquiry. Dr. Kuhn

has evidently been but little disquieted by "The little Dogs of Bretzvil and von Bretten." Undeterred by scorns and sneers, he carries on his quiet work, hardly noticing the weak expressions of incredulity on the part of those who, as he knows too well, have paid but little attention to a subject to which he has devoted the whole of his life. He carefully adds stone upon stone to the edifice of which he himself has laid the foundation. He remembers the manner in which Bopp's Comparative Grammar was received, and, like every honest scholar, he feels that truth is never in a hurry.

In the paper, lately read before the Berlin Academy, *Über die Entwicklungsstufen der Mythenbildung*, Dr. Kuhn's object is to show that the mythopoeic power does not stop at a certain time, but continues to work in accordance with the varying character of each successive period of civilisation. His arguments are chiefly directed against some of my own views; or, I should rather say, against some views which Dr. Kuhn supposes to be mine, but which I could not recognise as my own without considerable qualifications. In my *Essay on Comparative Mythology*, published many years ago, my object was to show that there are certain myths which all Aryan languages share in common, and which must therefore have had their origin during a period when there was as yet no Sanskrit as different from Greek, no Latin as different from Celtic or Teutonic. I tried to show that, apart from Greek, Latin, Teutonic, or Celtic mythology, there was a common Aryan mythology, which could be treated with success by the comparative philologist only. It seemed to me that the very existence of Comparative Mythology depended on the recognition of this fact, and at the time when I was writing, I felt that no language could be too strong to impress this truth on the minds of Greek and Latin scholars. I therefore spoke of a *mythopoeic period*, preceding the first appearances of any national language or literature, a period in the history of the human mind perhaps the most difficult to understand, and the most likely to shake our faith in the regular progress of the human intellect. What lies beyond that point, the gradual formation of Aryan grammar, and the incipient divergence of dialects and languages, is intelligible enough. Again, the earliest concentration of political societies, the establishment of laws and customs, and the first beginnings of religion and poetry, seem all under the control of rational agencies. But between the two there is a gulf which it seems impossible for any philosophy to bridge over. That is the time when those myths were formed which, both in their general character and in the names of the principal actors, are the same in India, Greece, Italy, and Germany. No one would suppose that these myths could have been invented independently in different countries, and nothing will avail but the admission that they were developed during a period antecedent to the first beginnings of what may be called Indian, Greek, Italian, Teutonic, Celtic, and Slavonic mythology. But though at the beginning of my *Essay* I laid such stress on the neces-

sity of admitting a *mythopoeic period*, previous to the separation of the Aryan race, I nowhere even hinted that at the expiration of that period the mythopoeic faculty became extinct. On the contrary, my object has always been to show how mythology must be understood in the very widest sense of the word, as the power of language reacting on thought in every sphere of intellectual activity, from the first dawn of civilisation to the latest philosophy of our own time. The Phlogiston, the Ether, the Atoms, the Animal Spirits, *et hoc genus omne*, I classed under the head of mythology as much as dragons and chimaeras; nay, when I read of Natural Selection and Spontaneous Generation, I doubt whether the *virus mythologicum* will ever be driven out of our intellectual constitution. What I believe became extinct at the end of that period which I called mythopoeic, *par excellence*, was not the myth-creating faculty, but those myths only which are common to all the Aryan languages. A myth about the Ganges, or a myth about the oracle of Dodona, cannot be referred to that pro-ethnic mythopoeic age from which we have received the name of Dyu, which afterwards was fixed under its various national aspects as *Zeús*, Jupiter, and Tyr. Dr. Kuhn is right when he says: "Max Müller hatte in seinem *Essay on Comparative Mythology* den Eintritt der Mythenbildung in die Zeit vor der Trennung der indogermanischen Völker versetzt;" but when he continues, "und hat damit ausgesprochen, dass eine Mythenbildung bei den einzelnen Völkern indogermanischen Ursprungs ausgeschlossen sei," I think everybody will see that I have not only not expressed this, but not even implied it.

It seems to me that the whole of my first essay and my later contributions to Comparative Mythology ought to have contradicted such a view. In order to show how even in late historical times myths arose in Greece and elsewhere, I referred to the myth concerning the foundation of Kyrene, which we know took place about Olymp. 30. The myth is: "The heroic maid of Kyrene, who lived in Thessaly, is loved by Apollo, and carried off to Libya." The fact was, "the town of Kyrene, in Thessaly, sent a colony to Libya under the auspices of Apollo." But, as if anticipating the possible misunderstanding of what I had said of the necessity of admitting a mythopoeic period, previous to the Aryan dispersion, I wrote in my *Lectures on the Science of Language* (ii. p. 391):—

"The period in the history of language and thought which I have thus endeavoured to describe as characterised by what we may call two tendencies, the *homonymous* and the *polyonymous*, I shall henceforth call the *mythic* or *mythological* period, and I shall try to show how much that has hitherto been a riddle in the origin and spread of myths becomes intelligible, if considered in connexion with the early phases through which language and thought must necessarily pass. Before I enter, however, on a fuller explanation of my meaning, I think it right to guard, from the beginning, against two mistakes to which the name of *mythic period* might possibly give rise. What I call a period is not so in the strict sense of the word; it has no fixed limits that could be laid down with chronological accuracy. There is a time in the early history of all nations in which the mythological character predominates to such an extent that we may speak of it as the mythological period, just as we might call the age

in which we live the age of discoveries. But the tendencies which characterise the mythological period, though they necessarily lose much of that power with which, at one time, they swayed every intellectual movement, continue to work under different disguises in all ages, even in our own, though perhaps the least given to metaphor, poetry, and mythology."

This passage, which Dr. Kuhn quotes himself, ought surely to have removed the idea, that I considered the mythopoeic faculty at an end as soon as the Aryan dialects assumed each its own national independence. I believe Dr. Kuhn would hold as strongly as anybody that there was a mythopoeic period common to the whole Aryan race; that there are myths which are in their beginnings neither Indian, nor Greek, nor German, and the very existence of which would be inconceivable without the admission of a common mythopoeic period preceding the separation of the Aryan race. It is in the treatment of these myths that comparative mythology has achieved its greatest triumphs, and with the denial of such a period some of Dr. Kuhn's most brilliant discoveries would fall to the ground. What Dr. Kuhn, however, shows very well is that even myths which, by the whole of their character, belong to a national period, which are decidedly Greek or Indian—nay which, even in Greece and India, betray their modern origin—may be traced, nevertheless, to beginnings that lie beyond the frontiers of these countries. Myths adapt themselves to the atmosphere of each country, to the circumstances of each age. We may safely say that no myth concerning the sea could have existed before the separation of the Aryan race. The sea was unknown to the Aryans before they separated; they had no word for it, no thought of it. Yet the name of an old Aryan deity, Varuna, originally the god of the covering sky, was transformed by the Indians and adapted to their new requirements when they wanted a god of the sea; so that Varuna in the later Sanskrit became the god of the sea, while in Greek Ouranos remained, as in the Veda, the god of the sky. The very name of Asura, in the sense of evil spirit, which it has throughout in the myths quoted by Dr. Kuhn, betrays its modern origin. It meant, originally, spirits only, without any reference to their moral character. It afterwards took the meaning of powerful spirits, was drawn more and more towards the side of the overwhelming and destructive powers of nature, assumed gradually a difference from the bright and beneficent Vasus or Devas, and became at last the name of their enemies. All these changes, which are clearly perceptible in the hymns of the Rig-Veda, must have taken place before myths of the battles between Asuras and Devas could have grown up. Yet, as Dr. Kuhn has well shown, the character of their battles is but a reflection of the battles between the old divine Asuras and the old evil spirits such as Vritra, the robber of the cows; and even the battle between Zeus and the Gigantes, who had stolen the cows of Helios, is but a faint echo of a myth which in its origin was Aryan, and not Greek, which dates in fact from that period which I called the mythopoeic.

I abstain for the present from entering on

the myth of the Argonautæ on which Dr. Kuhn has touched towards the end of his essay. He promises to give us his full analysis of that curious myth in his next paper, to which I and all who care for a sound and scholarlike treatment of Comparative Mythology look forward with great pleasure.

MAX MÜLLER.

SCIENCE NOTES.

METEOROLOGY.

The Effect of Rainfall on Barometrical Pressure.—Dr. J. Hann has published an interesting paper on this long-debated question in No. 19 of the *Zeitschrift der Oesterreichischen Meteorologischen Gesellschaft* for 1874, in which he criticises Reye's views, who maintains that the condensation of vapour to the form of clouds and to rain produces a marked reduction of pressure at the place. Reye has qualified this general statement by admitting that, if the rain is produced by the introduction of a mass of cold air into a warm and damp stratum, the barometer may rise during the rain; and so, finally, the only case to which his reasoning applies is that of a "courant ascendant" such as gives rise to the rains of the tropics.

Dr. Hann has taken Bergama's hourly observations for Batavia, of which we have now a series for three years, and finds that the barometer stands lower before the rain begins than during or after it; and, moreover, that the diurnal curve of the barometer is not in the least affected by the heaviest rainfalls.

He therefore arrives at the following conclusion:—"The condensation of vapour has no noticeable influence on the variations of pressure. The formation of barometrical minima cannot, therefore, be attributed to the rainfall."

The author next takes up the question of what the effects are which are produced in a column of warm and damp air which rises to a higher level, and shows that, if we suppose, e.g., one kilogram of vapour condensed, the entire amount of latent heat set free by this condensation must be abstracted from the air, and also the temperature of the latter must be reduced to the point corresponding to the tension of the vapour left in it after condensation. The mass of air must therefore contract, more air must flow in to fill up the space, and the barometer at the foot of the column must rise. In the case of the rain of the ascending current, heat is requisite in order to cause the air to expand, and any latent heat set free by condensation simply tends to reduce the rate of diminution of temperature of the entire mass.

Dr. Hann assumes the upward movement of moist air to be the most active cause of precipitation, and in the subsequent numbers of the same journal he proceeds to treat of the causes which produce such a movement.

The Distribution of Temperature in an ascending Current of Air.—In Nos. 21 and 22 of the same journal Dr. Hann deals with this question on the principles laid down by Sir W. Thomson, Reye, and Peslin, arriving at the following conclusions. If no condensation of vapour takes place, dry air falls about 1° C. for each 100 metres of ascent, and rises to the same extent for each 100 metres of descent, whatever the level of departure or the temperature may have been. The presence of vapour in the air, if not condensed, hardly alters this result.

The nearest formula for the changes in the column, if condensation takes place, has been given by Peslin (*Bulletin Hebdomadaire de l'Association Scientifique de France*, 1868), and the author gives a table of the decrease of temperature in an ascending current of air saturated with moisture for every hundred metres of change of level.

The actual conditions observed at various levels

are next discussed, especially on the occasion of a thunder-storm in Switzerland investigated by Billwiller, and it appears that the reduction of temperature is not nearly 1° C. for each hundred metres, a result confirmed by Glaisher's balloon observations.

It is evident that as a descending current cannot possibly give rise to the condensation of any vapour it contains, the rain of our S.W. winds, the return trade, is not due to moisture brought from the equator, as Maury always maintained. If this upper return current were charged with moisture, the sky in the trade wind zone must always be cloudy, which is distinctly contrary to fact.

Dr. Hann concludes with some remarks on the origin of cyclones, in which he considers that the fall of the barometer is a purely mechanical effect of the rotatory motion of the air, and on the whole agrees with Reye's idea that the motive force in the phenomenon is the latent heat of the condensed vapour; but he shows that mere condensation of vapour will not give rise to a cyclonic movement in the air; this does not come into existence until an ascensional movement has been started, and it increases in intensity by the action of the surrounding cooler air flowing in to fill up the space vacated by that which has risen.

Marine Meteorology in Germany.—The institution at Hamburg, founded in 1867 as the Nord-deutsche Seewarte, under Herr W. von Freeden, has at last been made a government institution, with that gentleman as director, assisted by Captain Koldewey as chief of the Marine Department. The allowance for establishment is 3,250*l.*; and for the year 1875, 3,740*l.* This is a step in the right direction, as the office has done some first-rate work; but we could have wished that the allowance had been higher.

Solar Radiation.—In the same journal, Mr. F. W. Stow gives the results of five years' observations on this subject, taken by himself and several of his friends at various stations in the United Kingdom. He finds that radiation attains its maximum in May at every station except London: the minimum radiation is in December.

Western stations show a greater effect of radiation than eastern ones, and proximity to the sea appears to diminish the power of the sun's rays, owing to the abundance of vapour in the air.

The instruments used are black-bulb maximum thermometers *in vacuo*, which have all been compared by Mr. Stow.

GEOLOGY.

As geologists grow bolder in their speculations on the climatic conditions of the Glacial Period, it becomes more difficult to suggest an efficient cause by which these conditions may have been brought about. A critical examination of the various theories which have been proposed to account for the climate of the great Ice Age has been recently contributed to the *Quarterly Journal of Science* by Mr. Thomas Belt, whose observations on glacial phenomena in Nicaragua and in Siberia have been of considerable interest. Having dismissed as unsatisfactory Sir Charles Lyell's theory of a change in the relative position of the continents and the ocean, and Mr. Croll's theory of an increase of the ellipticity of the Earth's orbit, Mr. Belt advocates the hypothesis that great changes have occurred in the obliquity of the ecliptic. While leaving the astronomer to discuss the possibility of such changes, and differing on many points from Lieutenant-Colonel Drayson, who recently advocated a similar theory, Mr. Belt approaches the question from the standpoint of a physical geologist, and seeks to show that a sufficient obliquity of the ecliptic would satisfy many of the conditions required by the glacial problem. Unlike Mr. Croll, he believes that the maximum of cold was simultaneous in the two hemispheres. This contemporaneous glaciation of both hemispheres would abstract from the sea a large body of water, represented by the ice piled up around

both poles, and would thus lower the sea-level to the extent, according to the author, of at least 2,000 feet. The rise of the level of the ocean, consequent upon the liberation of water from the melting ice at the close of the glacial period, might account for the almost universal traditions of great deluges. Moreover, Mr. Belt remarks that the heaping up of ice around both poles would alter the figure of the earth, lengthening its polar and shortening its mean equatorial diameter, and would thus give rise to a series of strains tending to restore its figure of equilibrium by depression of polar and elevation of equatorial land. If this equilibrium had been maintained during the glacial period, converse changes would be effected on the melting of the ice; the polar land being then raised and the tropical land lowered. The author suggests that the depression of the bed of the tropical oceans, attested in many parts by the growth of coral islands, may be referred to this cause; and another step leads him to the speculation that even volcanoes and earthquakes may be the result of movements of the earth's crust, due, not to secular cooling, as Mr. Mallet supposes, but to the straining forces set up by the melting of the polar ice-caps, which would tend to restore the equilibrium of the earth's figure. Mr. Belt claims for his theory that it explains equally the cause of the high temperature of early Tertiary times; a diminished obliquity of the ecliptic producing an amelioration of climate, just as an increased obliquity would augment its severity. Of course the magnitude of both effects must depend on the extent to which astronomers will admit that the obliquity may vary, and it is to be feared that the geologist requires more than the astronomer will readily concede.

SOME observations on the volcanic phenomena of Stromboli, made by Mr. R. Mallet ten years ago, have enabled him to suggest a mechanical theory in explanation of the rhythmical recurrence of the eruptions of this volcano. The intermittent explosions suggest a comparison with the periodical phenomena of geysers, and this comparison has been worked out in Mr. Mallet's paper published in the *Proceedings of the Royal Society*. If water should gain access to the main tube of the volcano through channels communicating with the sea, the ascent of the boiling water and the tension of steam and vapours introduced by other ducts below the sea-level, would tend to expel the lava and scoriae from the funnel of the crater in periodical outbursts, resembling those of a geyser. It may be added that Mr. Poulett-Scrope, in the last number of the *Geological Magazine*, criticises Mr. Mallet's views, maintaining that the phenomena in question are not truly exceptional, and that the mechanism of Stromboli does not essentially differ from that of other volcanoes.

ATTENTION has recently been called by Mr. T. Mellard Reade to the important effects of tidal action, viewed as a geological cause. In a paper printed in the *Proceedings of the Liverpool Geological Society*, he investigates the mechanical force which the tide-wave exerts on the sea-bottom. Although the disturbance of the sea by wind-waves is limited to a slight depth from the surface, yet the tidal stream acts at very great depths, and exerts a powerful abrading force on the floor of the ocean. The author believes that the tidal currents perform the great work of distributing the materials which come within their reach over great areas of the sea-bottom; for example, the mud of the Irish Sea appears to be formed for the most part of the materials of the glacial drift redistributed over the bed of the sea and re-composed by the agency of the tidal stream.

A LETTER from Dr. Oscar Lenz to Hofrath von Hauer, of Vienna, brings us geological news from the west coast of Africa. It states that Elobi Island, in the Bay of Oorisco, with a great part of the neighbouring mainland, consists of fine-grained laminated sandstones, perfectly horizontal, and rich in fossils, principally ammonites and marine

plants. In a journey to the Gaboon Dr. Lenz observed large quantities of a clayey brown iron-ore, and found some of the native tribes, especially the M'pangwes, skilful in smelting and working iron. Above the ironstone, in the neighbourhood of Gaboon, there occurs a horizontally-stratified limestone rich in fossils. Specimens of this and of the other rocks have been despatched to Berlin. In a second letter Dr. Lenz describes an excursion to the River Como, which, however, was not very fruitful of geological results.

FROM Teheran, Dr. Tietze sends home a geological letter to Von Hauer, in which he describes a journey, made during the months of May and June, to Isfahan and the district of Chonsar. The mountains on each side of the road consist for the most part of dolomitic limestones; several occurrences of ores—chiefly haematite and galena—were noted, but the want of fuel will impose a great check on the development of these mineral resources.

DURING the Arctic voyage of the ill-fated *Hansa*, a number of specimens of rocks were collected in the south of Greenland by Professor Laube, who on his return placed them in the hands of Dr. Vrba, of Prague, for description. The results of these petrological studies have been laid before the Academy of Sciences of Vienna, in the shape of a memoir which is published in the Academy's *Sitzungsberichte*. The investigation is of some interest, since the precise locality of each specimen has been carefully recorded, whereas in most other cases such specimens have been vaguely labelled "Greenland." Microscopic sections of the rocks have been studied, and where necessary chemical analyses have been made. The specimens consist of granite, gneiss, eudialyte-syenite, orthoclase-porphyr, diorite, diabase, gabbro, and a mineral locally called "soft stone" (*Weichstein*); this is the general name applied to all those substances which are sufficiently soft to be worked by the primitive tools used by the natives. Two specimens of these stones were brought home by Laube, and have been analysed; the one is a serpentine containing but little water, and the other is a compact clinoclase.

As Spitzbergen has been visited and described by several geologists, especially by Nordenskjöld, it was hardly to be supposed that much novelty would be found in Dr. von Drasche's paper recently published in the *Mineralogische Mittheilungen* of Professor Tschermak. In this essay the writer describes the scientific results of a short trip last summer to parts of the west coast.

SOME fossils, mostly brachiopods, from the Carboniferous Limestone of the south of Spitzbergen, have been described and illustrated by Professor Franz Toula, in the *Sitzungsberichte* of the Vienna Academy. The specimens were obtained in the summer of 1871 by Lieutenant Payer and Lieutenant Weyprecht.

A DESCRIPTION of the lignite and brown-coal deposits of Croatia and Slavonia, by Herr O. M. Paul, has appeared in the last part of the *Jahrbuch d. k.k. Geologischen Reichsanstalt*. The tertiary deposits of these countries contain fossil fuel on five distinct geological horizons.

UNDER the name of *Dawsonite* Dr. Harrington, the Mineralogist to the Geological Survey of Canada, has described in the *Canadian Naturalist* a new mineral species found in a trachytic dyke near McGill College, Montreal. The name is complimentary to Dr. Dawson, Principal of the College. That Dawsonite is a distinct mineral appears to be well established, but its chemical composition is certainly curious, if, as the author supposes, it is to be regarded as a hydrous carbonate of aluminium, calcium, and sodium; it is, however, also suggested that it may be a hydrate of aluminium, combined with the carbonates of calcium and sodium.

A NEW fossil fish from the coal measures of Airdrie, in Lanarkshire, has been described by Dr.

Traquair, in the December number of the *Geological Magazine*. The fossil, which was obtained from the blackband ironstone, is in a very imperfect state, without a head, and with only fragments of one fin; it is, therefore, with some doubt that it is referred to the carboniferous genus *Uronemus*, under the specific name of *U. magnus*.

A TELEGRAM from Major Palmer, R.E., announces that the English parties in New Zealand, though spread over as large a tract as possible, have not succeeded in getting any useful observations on account of the bad weather generally prevalent, though the American Expedition under Professor Peters at Bluff Harbour to the extreme south got several photographs as well as the observation of ingress. They were, however, unable to observe the egress, which is the really important phenomenon at New Zealand, being required for comparison with the Egyptian and other western stations. The observations in Australia, though the acceleration of egress is not so considerable, will partly compensate for this failure, more especially as the longitudes can be very accurately determined for the Australian stations. As a set-off to the bad luck of the New Zealand party, it is satisfactory to learn that Captain Tupman at Honolulu, and Mr. Johnson at Atooi were successful, sixty photographs and 120 measures with the double image micrometer being secured, though there seems to have been some failure with the Janssen revolver-slide. Professor Forbes at Owhyhee was unfortunate in the weather, but the success obtained at the other two stations fully makes up for the loss of one set of observations. The Sandwich Islands was really the most critical station of the whole set, as if ingress were lost there the observations of this phase, which it is hoped have been successfully made at Kerguelen Island, the Mauritius, Rodrigues, Bourbon and Amsterdam Island, would have been of very little use, and for this reason Sir George Airy was careful to spread his observers in the Sandwich Islands as much as possible, the wisdom of this course being fully justified by the result.

FINE ART.

Michael Angelo, Sculptor, Painter, Architect: The Story of his Life and Labours. By Charles Christopher Black. (London: Macmillan & Co., 1875.)

WHEN Vasari first wrote the life of Michael Angelo, he was considered by the sculptor's friends to have been so partial and incorrect as to require a formal refutation. After the appearance of Condivi's demurrer, Vasari wrote the life afresh; and the joint industry of the two biographers has furnished materials for all subsequent historians. The bibliography of Buonarroti is copious; but if it has added anything to our knowledge of the man, it has only done so in respect of illustrative detail and chronology, for in respect of art our judgment is essentially the same as that of the sixteenth century; and it is probably correct to say that the labours of all the moderns, from Duppa to Grimm, have done no more than dress the simple outline of the hero's life with appropriate ornament. Yet if the biography of Buonarroti has not increased in weight of matter, it has certainly become enlarged in size, and the latest efforts of Harford and Hermann Grimm have both extended to the breadth of two volumes. Whether it be from this cause that Mr. Black has only ventured on a short "story" instead of a long life of Michael Angelo, or whether the costly folio before us was only thought of because the

intercentenary" of Buonarroti was announced for the coming month of March, perhaps an indifferent matter. Under circumstances is the publication to be regretted, since it serves to revive our memories of an immortal craftsman, not only through the medium of description in luxurious type and binding, but by means of useful illustrations.

Mr. Black's "Life" lays no claim, he says, "to the higher and graver title of a biography." It is followed by bulky appendices, including extracts from some of the artist's letters; a chronology of the principal events in his life; a classified catalogue of works under three heads; a special catalogue of paintings, drawings, and models in England; a bibliography, and an index of wings. The volume is a counterpart in many respects of that which Mr. Black and Mr. Heaton wrote last year in illustration of Da Vinci, but why it assumed its present form it is difficult to say, unless we suppose that it was modelled on the life and commentary in Lemonnier's last edition of Vasari. In truth, the "story," as Mr. Black calls it, is in many respects a paraphrase of Vasari and Condivi, followed by a chronology copied, with some literal alterations, from that compiled by Milanese and Carlotti. The disadvantage of this arrangement is one which naturally clings to an old book with a modern commentary; for the commentator dares not alter the text, and necessarily appends to it additional dated information; but a writer of the present day might do better than supplement in this manner a work which has not the advantage of being three hundred years old. Or by following this course he forces the reader to jump from the biography to the commentary, when—as in the case of the Piccolomini Chapel at Siena or Marshall Hall's *David*—no allusion of any kind is to be found in the former, and the omission only made good in the latter, or he leaves the reader for a time in ignorance as to some serious incidents in the master's life. Irrespective of this, Mr. Black's life is cleverly etched; and, though it does not embody the research of modern criticism, is fairly well. It errs in some points, but nowhere more than in the following, of which a statement shall be given by way of illustration.

It was a peculiarity of Michael Angelo that under the influence of a certain class of feelings he felt the inward necessity of a rapid and secret change of place. Before the banishment of Piero de' Medici in 1474, he withdrew quickly to Bologna. During the papacy of Julius II. he fled from Rome with speed and secrecy only equalled by Constantine when he baffled the watchfulness of Galerius. When Florence was besieged in 1529, he sewed his money in his clothes and rode to Ferrara and Venice in feverish haste. Two of these events Mr. Black correctly relates. The third, for some unexplained reason, he attenuates or ignores. In July 1529, Michael Angelo, being one of the superintendents of the fortifications at Florence, was sent by order of the *balia* to study the works of Ferrara. He was presented on this occasion to the Duke Alfonso of Este, who showed him his gallery, and extracted from him the promise of a picture.

In September, being haunted by visions of Malatesta Baglione's probable treason, he escaped from Florence through a postern, rode to Ferrara, and thence, after a short interview with the Duke, to Venice. On September 30 he was proclaimed an outlaw and threatened with the penalty of treason if he did not appear in Florence by October 6. On October 13 he signified his wish to return through Giugni, the Florentine envoy at Ferrara. On October 20 the Florentine *balia* wrote to Giugni, informing him that they had given safe-conduct to Michael Angelo. On November 9, Giugni wrote the pass with which Michael Angelo re-entered Florence. These facts are recorded in official documents printed by Gaye. Mr. Black sets every one of them aside, saying that during the delay incurred by Philibert of Chalons to advance on Tuscany, Michael Angelo left Florence for Venice by way of Ferrara. He then reduces Buonarroti's two interviews with Alfonso to one, and expresses doubts as to whether the motives for the journey will ever be divulged. Some unavowed mission from the Florentine government is obscurely hinted at. It is denied that Buonarroti was outlawed; and excuses are made for the artist on the ground that "he had been assured that so rotten was the edifice of Florentine liberty, that a few days or even hours might put the city into the hands of the Medici."

We may regret again that Mr. Black should not have told us something decisive as to the growth of the style of Michael Angelo, or how much he derived from his master Ghirlandaio, or the classic Greek; how much from Donatello, Masaccio, Lippi, and the rugged Signorelli. His well-known study of anatomy in convent mortuaries, and his relations with the great professor of Pisa, Realdo Colombo, are passed over in silence. Our author could not forget, and for that reason he dwells alike on the friendly ties which bound the artist to Vittoria Colonna, and the unfriendly ones which he kept up with Aretino; but he might have remembered more of the patronage of Lorenzo de' Medici, in whose palace Michael Angelo lived; the lessons of the great Poliziano, the friendship of Claudio Tolomei and Annibal Caro. There is some bareness too in the mention of Sebastian del Piombo as a mere pupil of Buonarroti, when we know that Sebastian was a master before he came to Rome; too curt is the allusion to the relations with Bramante and Raphael. Above all, the double error should have been avoided of confounding the Farnesina with the Farnese Palace, or making Michael Angelo in the Life pay a visit to Raphael which in the Chronology is paid to Del Piombo.

J. A. CROWE.

FRENCH CHRISTMAS BOOKS.

Paris: Dec 25, 1874.

It is dark and cold, and snow is falling and melting as it falls. The children, whose holidays began yesterday evening, are playing listlessly, not so much amused with the playthings or the books which Christmas has brought them as thinking of what New Year's day will bring. These two festivals are only six days apart, and the one injures the other. Here, the Christmas tree does not display the gleam of its thousand little tapers

as in the North, and New Year's day especially is a forced loan. Imagination does not console us for the truth.

When there is no frost during these weeks, the year seems to be foundering in a sea of mud, and to suck you in with the sinking wreck. The lapse of time, the deaths of children, the strength of manhood extinguished, abandoned attempts, double-faced oaths, haunt your brain, like that of a drowning man in his agony. During these hours of gloom, one can neither wander through the streets, nor look at paintings, nor try to sketch a Japanese work of art, nor write a fragment of a book in preparation, nor turn over the leaves of the volumes piled on one's table. When the lighted lamp is brought, it recalls you to life indeed, but to the life of a prisoner; it is like the gleam of the oil-lamp in a railway carriage when you are rushing swiftly through a long cold tunnel.

Yet I will overcome these gloomy phantoms. I will finish this year 1874 by telling you how deeply touched I am at the large and cordial share which you give my correspondence in this review. Free at Paris in the *République Française*, free at London in the *ACADEMY*, I am assuredly one of the most favoured of "citizens of the world." I know no other way of expressing my gratitude than by working with yet greater energy, and speaking with yet greater frankness than before.

I will also, to clear my brain and nerve my heart, tell you that my country seems to have gained in power of criticism as much as she has lost in prestige. It is in vain that the Bonapartists are hovering about France, stretching out their necks and croaking like ravens. She is still stretched upon the ground; a thousand black fetters bind her down. But she is not dead. New blood is replacing, drop by drop, the blood which has gushed in torrents from the wounds the Empire has given her. In Slavonic tales there is a man who hears the grass growing; he who listens can hear the sound of healthy life in the veins of our rising generation.

Last year, New Year's Day was a nullity as regards gift-books. This year the publishers have taken heart. I shall speak of a few books. Not to give a catchword for advertisements, but with the object of disengaging the main ideas which have severally inspired these publications, I shall be as brief as possible. I shall often try to put the whole of a detailed criticism into a simple epithet, addressing those who for almost ten months have accepted in the *ACADEMY* my modes of seeing, feeling, and judging.

The first of these books is the *History of a Fortress*, text and drawings by Viollet-le-Duc. In giving it the first place I am not obeying a feeling of party spirit or of patriotism. But a successful work of art is only enhanced when it is the outcome of a situation, when it is the soul of one's native land which dictates it, paints it, sculptures it, sings it. This is a manly book which recalls to the reader that he must jealously protect the integrity of his country's soil, and teaches him the history of the art of defence by historical hypotheses which bear the stamp of probability, and by restorations based on scattered fragments of authentic monuments. Last year M. Viollet-le-Duc gave us the *History of a House*, that is, how to build a country seat according to the owners' taste, from the day they have settled on its position in the park, to the day of their moving into it. This year the man excels the artist. M. Viollet-le-Duc, in his recent candidature for the Municipal Council of Paris, made one of the wisest speeches which ever came from the lips of one belonging to the governing classes, or rather to the *élite* of our new social strata: "Up to 1870, I had never troubled myself with politics." His book shows what help our artists, hitherto indifferent to the social movement, may bring by their mighty privilege of spreading ideas among the people by means of imitative art.

M. Viollet-le-Duc's publications are well known, and, I believe, highly appreciated, in England. The *Dictionary and Conversations on Architecture*, the *Dictionnaire raisonné du Mobilier français pendant le Moyen-âge*, are works of vast compass which may be open to criticism in their details, but which have had in France a considerable influence on all minds free from the tutelage of the Institute. The apostle of the doctrine of Lassus, the illustrious architect of the Romantic period, he has grouped round him a whole school of architects possessed by a passion for our national arts, while the School of Rome was celebrating all the inconsistencies of the pseudo-Greek and the pseudo-Roman. It is to the School of Lassus and of Viollet-le-Duc that we owe the preservation and restoration of all our Gothic cathedrals, the most magnificent jewel of our artistic crown in the past. He is a vanquished Gaul, and not a Latin slave.

The idea is as follows. There is a plateau situated at the junction of a river and a broad brook running through a valley. This plateau is the key of the valley of the Saône. From time immemorial it has been utilised, first, for the personal defence of the earliest inhabitants, then for that of the Roman legions, next by the feudal lords; it was fortified by Vauban, and in 1814 it stopped the march of the Allies; in 1870 it might again have effected a diversion on the flank of the Prussians had it been armed and defended. Each historical period gives rise to a system of defence appropriate to the new weapons, and to a siege. You know one of the most interesting parts of the *Dictionary of Architecture* is devoted to the art of fortifications. Here, as there, M. Viollet-le-Duc has called in the pencil to the help of the pen. The woodcuts with which he has lavishly interspersed the text, representing attacks on the ramparts, sorties by the besieged, burning towers, ancient engines of war, effects of artillery, are sketched with a brightness, a life, a vividness only to be attained by a consummate archaeologist who is at the same time an artist of no second-rate powers.

M. Viollet-le-Duc was appointed Colonel of Civil Engineers at the beginning of the siege of Paris. He had some very ingenious and very practical plans of defence. The military engineers would not so much as hear the civilian's name. Helped by the population of Paris, whose despair at having been kept idle can never have the full meed of glory which it deserves, the most sober thinkers believe that he might have broken the lines of investment. Those lines once broken, with Gambetta beyond, who would venture to say that France might not have burst her bonds?

The public now are conscious of all these errors. They are more serious. The study, or if you will, the reading of geography is making the most undeniable progress in our schools and families. You are a people of navigators. You know geography as the Cossacks know how to ride. We are a people of peasants. Till the day when railways furrowed our departments, some villagers had never made their way even to the neighbouring town. I am not exaggerating. The "tour of France" formerly made by our workmen contributed more than books to the emancipation of their minds. Even at the present day the Frenchman is not easily induced to stir, but he has a growing curiosity for what is foreign. A publication founded in 1860 by M. Edouard Charton, and issued by Messrs. Hachette under the title of *Le Tour du Monde*, a collection of contemporary travels, now reckons its subscribers by tens of thousands. You are aware that M. Edouard Charton was formerly a disciple of Saint-Simon, and founded in 1833 the *Picturesque Magazine*, on the model of your magazines, and that this popular publication is still in existence, after having exercised a very wholesome influence, by its text as well as by its woodcuts.

L'Inde des Rajahs, after having appeared in the *Tour du Monde*, has just appeared in one large and

admirably printed volume. It is the account of a journey in Central India and in the Presidencies of Bombay and Bengal. The author's name is Louis Rousselet. In the course of his five years' stay, I should think the correspondents of the English papers will have more than once mentioned the presence of the French traveller in your possessions. I think it is only an act of international politeness and justice to reproduce the closing lines of his book:—

"De la part des Anglais, l'accueil dont je fus l'objet ne fut ni moins sympathique, ni moins courtois. Nul soupçon, nulle jalousie, ne vinrent entraver mes recherches. Bien au contraire, je rencontrai partout la plus franche hospitalité, une cordialité touchante, et même je dois dire l'appui le plus sincère."

M. Rousselet gives in support of his descriptions 317 engravings done on wood by our best draughtsmen from his photographs and sketches. I will not dwell on sites and types, monuments and interiors, which special publications, and marvellous photographs particularly, have popularised among you. To mention but two artists, I will only dwell on M. de Neuville's really remarkable rendering of human beings, and M. Thérard's of architectural exteriors. Photography is the most cruel enemy of academic doctrines. It accustoms the eyes to the reality of artistic objects, as chemistry, that most cruel enemy of metaphysical entities, accustoms the mind to the reality of phenomena. We must commend the editors for having required of the artists—I count fourteen contributors to the book, all of more or less eminence—to confine themselves to the literal rendering of the documents entrusted to them, instead of allowing them, as was the custom until very lately, to arrange scenes which set at defiance the bearing, habits, passions, prejudices peculiar to each race, to each people, according to the degree of latitude, climate, origin, and contact with European civilisation. Here, then, is the proof of what I said at the beginning of my letter, that there is a higher average of critical sense in France.

I will mention briefly a book of information, trustworthy, though greatly compressed, on the *History of Costume in France* from the earliest times to the close of the eighteenth century. It is by M. Quicherat, the learned Director of the Ecole des Chartes. This work appeared in fragments long years ago in the *Picturesque Magazine*. Messrs. Hachette have now republished it in a large octavo volume, illustrated with 480 woodcuts from authentic documents. It is a good summary for the use of general readers, and even of men of letters who require a concise and brief scholarly work.

I am anxious to come to publications on the Arts, but I see that I have very little blank paper left, and your bibliographical department is so well-informed that I shall scarcely be able to tell you of any books which have not been brought under your notice in the course of the year. However, I am bound to point out that never in France was there so considerable a group of scholars devoted to the study of original documents. The impulse was given, about the time of the Revolution of 1848, by some pupils of the Ecole des Chartes, of whom M. Anatole de Montaiglon is the type. These were joined by workers such as M. Paul Mantz and Ph. de Chennevières. The *Archives of French Art*, the *Abeceario* of Mariette, the *Memoirs of the Members of the Old Academy of Painting*, appeared, in spite of the culpable indifference of the public and the blind jealousy of the critics, friends of the Institute, who felt what a blow this scholarship would strike at their ignorant and parrot-like system of aesthetics. The impulse was given. It has taken a fresh start in our days, with more suppleness, less rigour than our predecessors had employed.

Edmond de Goncourt, left alone since his brother's lamentable death, has just republished, in two volumes, their joint history of *Art in the Eighteenth Century* (Rapilly): in a highly-finished

literary form, it is an ardent appreciation, at once enthusiastic and teasing with facts, of the work and life of Chardin, Boucher, Greuze, the St. Aubins, the vignettists, &c. Very shortly will appear a volume devoted entirely to the work of Watteau, an index of his paintings and engravings known in museums, libraries, and private collections.

M. Guiffrey has reprinted the whole series of Exhibition catalogues from the foundation of the Academy to 1800, with explanatory notes (Baur). The catalogues of the rival Academy of St. Luke complete a repertory which enables us to follow from year to year the productions both of the masters and of the most forgotten painters during that admirable period of the eighteenth century in France.

M. Lecoy de la Marche has collected, in one volume (Didier) documents from the archives of the Academy of France at Rome, which he had previously communicated to the *Gazette des Beaux-Arts*.

M. Charles Gérard, a lawyer, has gone farther back into the history of the past. He has given us, under the title of *The Artists of Alsace during the Middle Ages*, a collection of notes, often supplemented by appreciative comments, which reveal a wholly French national origin precisely where the Germans violently assert their priority.

I must also mention the *Inventory of the Furniture of Catherine de Medicis*, drawn up by M. F. Bonnaffé, from the MSS. of the National Library, with notes showing a perfect knowledge of the Renaissance. M. Bonnaffé possesses a very choice collection of French works of art. Lastly, a publication of a very special character, executed in chromolithography by Messrs. Morel—*French Flags*, by M. Gustave Desjardins, pupil of the Ecole des Chartes. It is incomprehensible why such a subject should never yet have been adequately treated. M. Desjardins has collected facts utterly unknown. For instance, he proves that France possessed no national flag—that is, no ensign uniform, universal and obligatory—until the French Revolution. Another equally curious revelation is that modern French society has adopted without suspicion the three colours which were the privilege of the royal livery—red, white, and blue!

This review of Christmas books is of course very incomplete. It marks, however, two tendencies: the one in the direction of topographical accuracy and ethnographical precision in books of travel; the other in that of the sources which allow us to reconstitute in their true light and bearings the artistic personalities and events of our past. Under the Empire, only some sixty copies were printed of the latter series of books; now more than two hundred copies are subscribed for before the book is on sale.

PH. BURTY.

NOTES AND NEWS.

A PORTRAIT of the Dean of Christchurch has been completed by Mr. Watts, R.A., during the present year. Mr. Watts has been remarkably successful in getting the likeness, and in rendering the character of the large and strongly-marked features of the Dean without catching the faintest shade of caricature, or running into any undue harshness. The portrait, which is to be placed in the hall of the college, will appear, it is hoped, at the next exhibition of the Royal Academy.

MR. MILLAIS, R.A., will again show in force as a portrait painter, and his portrait of a young lady (Miss Tennant), executed during the past summer, is reckoned one of his most successful efforts in this direction. Mr. Millais never gets the accent of refined manners and luxuriant elegance which some French painters—notably M. Carolus Duran—contrive to impart to the heroines of birth and fashion; but he commands the springs of a life and reality untouched by any of his contemporaries.

R. MADDOX-BROWN has lately completed an picture of moderate dimensions, to which the *Byron's Dream* is given. It bears two mottoes from Byron's poem of *The Dream*:—

"Looking afar if yet her lover's steed
Kept pace with her expectancy;"

"She was his life,

The ocean to the river of his thoughts."

indicated by these citations, the picture represents Byron in his early youth, sixteen or seventeen years of age, with the lady of his love, the beautiful Miss Chaworth, on the hill in Annesley Park, which is so vividly described in the second stanza of the poem:—

"A gentle hill.

Green, and of mild declivity, the last,
As 'twere the cape, of a long ridge of such;
Save that there was no sea to lave its base,
But a most living landscape, and the wave
Of woods and cornfields, and the abodes of men
Scattered at intervals, and wreathing smoke
Arising from such rustic roofs. The hill
Was crowned with a peculiar diadem
Of trees in circular array—so fixed,
Not by the sport of Nature, but of man."

the distance is seen the tower of Hucknall-kirk Church, where the great poet now lies buried. Miss Chaworth, a little older than Byron, is portrayed for him, as he gives us to know in a very poem, a quiet sisterly liking; while he is sadly felt for her a passion the most ardent and absorbing, though as yet barely realized to his own mind. The painter has presented the youth-couple as seated on the hill (a slight and fully missible departure from the poem, which speaks of them as standing). Miss Chaworth has rich burn-tinged hair, which falls over her shoulders: a grey straw hat is dangled by its pink ribbons in her right hand. She is looking out for her lover, the Mr. Musters who married her about a year afterwards, and who is perceptible at a considerable distance below, galloping towards her; he is in hunting-costume, and waves his handkerchief as he nears the hill. The left hand of Miss Chaworth is lightly touched by Byron's left: she makes no motion to withdraw it, but her mind is elsewhere. Byron, with parted lips, contemplates fixedly her straining half-averted face; if there is intentness in her gaze, there is intensity in his. His head, with its closely curling light-brown hair, is uncovered; the straw hat lies on the ground, along with a dog-whip; and some characteristic details of dress, such as the run-down collar, and a plaid partially covering the left foot, have been heedfully introduced. The young lord's celebrated Newfoundland dog, Boat-rain, black and white, is couched at his feet; he also looks out, attracted by the sound of the approaching horse's hoofs. The expression of the picture is strikingly concentrated in the eyes of the two personages. Mary Chaworth gazes onward for her lover so that the pupils of her eyes are turned entirely away; those of Byron's eyes, riveted upon her countenance, are but just visible. The character of the varied and extensive landscape, studied on the spot, corresponds of course with the description given in the poem; the sky is rather grey than blue, broken with a few gently-moving white clouds. The composition is mainly the same as in a vignette of the same subject executed by Mr. Maddox-Brown for an edition of Byron published in 1870. Combined with great depth of feeling, the picture has general amenity of treatment; the colour, rich and delicate, is, long with the tone, markedly direct and natural. This is a painting worthy of the poem and the poet that it commemorates.—We may here add that the same artist's picture of *Cromwell on his Farm* (of which we spoke in the ACADEMY several months ago), and his portrait-group of Professor and Mrs. Fawcett, are at present among the works exhibited at Manchester Institution, where they have excited a very lively sensation, and continue to form the topic of much debate, spoken and printed.

Towards the middle of the current month he delivered two lectures on subjects of Fine Art at the same Institution; these are to be repeated at the Philosophical Institution in Edinburgh, in January, although the painter, as we understand, has no intention of appearing with any sort of frequency as a lecturer.

AMONG the prints recently acquired by the British Museum from the Howard Collection is a large and curious early woodcut of a man-of-war of the time of Queen Elizabeth. This print is interesting from its being probably the work of an English engraver. No other impression of it is known. It is printed with three blocks, and gives a broadside view of a ship full-rigged, with after-mast, foresail, and mainsail, and, hanging over the side, a large standard quartered with the arms of the Howard family. This makes it probable that the ship represented was the *Ark Royal*, the largest ship in Queen Elizabeth's fleet at the time of the Armada, and the flag-ship of Lord Howard of Effingham.

THERE is to be seen among the classical curiosities in the British Museum, a terra-cotta imitation of a foot wearing a hob-nailed boot, which is remarkable for the manner in which the nails are arranged in the sole, viz., in the form of A at the toe, which is pointed, and in the form of Q on the heel. Had the work been Byzantine, or of the earliest Christian period, it would have been at once decided that we have here an example of the use of *Alpha* and *Omega* to indicate the beginning and the end, or, as one perhaps ought to say in the case of a boot, the first and the last. But the work has no trace of the degradation which is usually found on common objects of this kind in Christian times. One would call it even earlier than the Alexandrine period.

PROFESSOR CONZE, of Vienna, announces that his annual series of *Vorlegeblätter*, or illustrations for archaeological discussions, will next consist chiefly of engravings from Greek vases painted by Duris, whose style is characterised in a remarkable degree by the length of limb and muscular development of the torso in the human figure, a propensity for very bold foreshortenings, and a choice of subjects which present excited movement. Among them will be figured the three vases by this painter in the collection of the British Museum. Of these only one had been before engraved (see *Archæologia*, xxxii. pl. 8, 9, 11). As regards Duris there is a question at issue among archaeologists which Professor Conze hopes to present in a clearer light by thus collecting together all the known works of the painter. It has been noticed that, side by side with his singular freedom and boldness in drawing the human figure, there is also in the faces, in the draperies, and in other details, a stiffness such as is expected to be found only on very early vases, where, of course, freedom of drawing like that of Duris would be the last thing to look for. He signs his vases "ΔΟΥΡΙΣ ΕΡΠΑΦΕΣΣΕΝ," where, as in Archaic Greek, the O stands for OY and OE for Y. But this, again, is not consistent with the boldness of drawing just spoken of; and so it is argued that Duris, like a modern imitator of the Præraphælite painters, is correct enough in his details, but otherwise cannot conceal the influence of the later times in which he lived. Still, Duris may have signed his vases in the archaic manner without any more thought of otherwise imitating the older vase-painters than our artists have of copying the ancient masters when they add *fecit*, *del.*, *sculp.*, &c.

A CORRESPONDENT of the *Japan Herald* states that the long vaunted supremacy of Japanese lacquer is now threatened by the discovery in South America of a tree named *Urari*, the juice of which has hitherto been used by the natives to poison their arrows, and in the course of recent experiments it has been proved to yield a varnish equal to that produced from the sap of the *Urushi*. Incautious handling of the

Urari sap produces, as in the case of lacquer, external eruptions on the body, face, &c., but the antidote lies in the bane itself, as the juice, taken inwardly, cures the disease.

M. LALAUZE has etched ten little pictures of children, which M. Cadart, of 56 Boulevard Hausmann, has published under the title of *Le Petit Monde*. The publication makes a handsome little present for Christmas or the New Year, though the prints differ much in artistic merit. They portray the common little episodes of child-life among the comfortable classes. Here the little girl says good night to *petit frère*; here she is allowed to give him his soup; here she is brushing her lap-dog's hair; here, to imitate her father, she has made an easel of the back of a chair, and has set up an easel-picture thereon, and here she sits sprawling on a seat too big for her while her awkward irresolute fingers fumble on the keyboard of the piano. One notices the general predominance of accessories: the child's face is lost in the prominence of these; her character is not much individualized. Thus there are two or three charming interiors, but little revelation of anything in child life or character that lies below the surface. The Renaissance cabinet in *La Soupe à Bébé* is delicately etched; it is a far more interesting thing than the faces of the two children. There is then little invention, but much agreeable composition and execution. The *Leçon de Musique* is the cleverest, though not the prettiest of the etchings. As etching the work is unequal; there is some freedom and frankness of line, lights and shades fairly balanced and arranged, but the modelling is often deficient, especially where it deals with the bare figure—face, arms, and hands—the firm roundness of leg, or strength of clumpy little boot, is better given. As for the genuine spirit, the humour of the thing, that is no better and no worse than in pictures of child-life generally; for in some of the most popular of them—Frülich's *Lily's Day*, for instance—you have to make believe a good deal as to the fun or fancy in them. In this very Frülich the only really humorous things are the sketches of papa receiving a difficult message from mamma through the child, and papa's relief when at last he understands the message—and in these the humour is less in the child's helplessness than in the perplexed endeavour of papa.

THE French engraver M. Gustave Lévy, well known for his excellent renderings of Raphael's works, is preparing a plate after M. Couture's *Damocles* which, it is affirmed, will make a great sensation at the next Salon.

By a singular coincidence, the Buonarroti Villa, near Settignano, the house of Michael Angelo's father, and the one in which the great artist passed his childhood, is now inhabited by a gentleman named Bandinelli, a lineal descendant of Michael Angelo's old enemy, Baccio Bandinelli. A correspondent in Florence, who has lately visited the villa, tells us that of the drawing of the so-called satyr, attributed by tradition to Michael Angelo, only the upper portion of the figure now remains. The legs, if ever drawn, are quite obliterated. The figure, which is of life size, is situated at the top of the stair leading to the kitchen. It is now carefully preserved, and has shutters in front of it to protect it from injury. Besides the satyr, there are two chimney-pieces in the villa that are said to have been sculptured by Michael Angelo in his youth, but these are decidedly of later date. Some clever heads in fresco upon tiles (a mode of painting that consists in laying a thin lime *intonaco* upon the flat tile, and painting on it while it is wet), although they do not pretend to be by the great master himself, are of interest. They are, no doubt rightly, attributed to Giovanni da San Giovanni. As this villa is frequently mentioned by Michael Angelo's biographers, though none of them have apparently examined it for themselves, and as it will no doubt assume some importance at the time of the Michael Angelo

celebration, these details may perhaps have some interest. It seems a pity that such a memento of the grand old Titan's youth should not, like the Palazzo Buonarroti in Florence, belong to the State. If we are rightly informed, it is not even, at the present time, in the hands of the Buonarroti family. It is a good-sized house, beautifully situated on the olive-clad slopes of the range of hills stretching east from Fiesole, and commands a noble view over the Val d'Arno and Florence.

WE noticed a short time ago (ACADEMY, November 28, 1874) a French invention by means of which plaster casts might be made more durable and of greater excellence; we are now informed of a German discovery of a new plastic material that will, it is said, supersede the use of plaster altogether. The constituents employed are entirely of a mineral nature, and yield, when mixed together, a smooth hard white mass capable of a high degree of polish. The material is especially adapted for taking casts of such objects as are required to withstand the influence of the weather, and the finest and most delicate work can be reproduced in it quite as well or better than in plaster. It is also spoken of as affording an excellent ground for stereo-chromic pictures on account of its great hardness and strength. As it is fire-proof as well as water-proof, a coating of it may be used to protect wood carvings and other inflammable decorations of a building, even light gauze stuffs and muslin hangings are rendered quite fire-proof by it. This latter quality was tested recently at the Munich Court Theatre, and it was found that stuffs or wood treated with it were rendered absolutely incombustible. The invention has been patented by Herr Walz, a merchant of Pforzheim, and Herr Kreittmayr, the Curator of the Royal National Museum of Munich.

IN a recent article in the *Augsburger Allgemeine Zeitung*, Dr. O. Eisenmann makes known a discovery that he considers he has made respecting the early German master who has hitherto been known, from his principal picture in the Munich Gallery, as "The Master of the Death of the Virgin." This remarkable work reveals an artist of very high attainments, one who possessed all the power and colour of Rogier van der Weyden, with a touch of the grace and ideality of Meister Stephan, but hitherto the name of this accomplished master has eluded the researches of savants. Dr. Eisenmann, however, during a visit to Calcar this autumn, occupied himself with studying the high altar in the church of St. Nicolas in that town, and his study led him to the conclusion that the wings of this great altar-piece, which is described by Förster, Hotho, and several other writers on German art, were painted by the same hand as the *Death of the Virgin* of the Munich Gallery. His further researches elicited the information that the original documents relating to this altar-piece were still preserved, and that in these it was stated that the painter's name was Jan Joest, and that the wings were begun by him in 1505, and finished in 1508. There was nothing in these dates to contradict the supposition of Dr. Eisenmann, for the repetition of the *Death of the Virgin* in the Wallraf Museum at Cologne was not painted until 1515, and even allowing that the Munich example was painted some years previously, as is supposed, it would still allow time for a settlement in Cologne between the finishing of the one altar-piece and the beginning of the other. It is principally, however, from strong internal evidence—such, for instance, as the likeness of the woman of Samaria in the Calcar picture to the St. Gudula of the *Death of the Virgin*, that Dr. Eisenmann has come to the conclusion that in Jan Joest we have the long-sought-for master of the *Death of the Virgin*. The painting in our National Gallery on the same subject—attributed, but evidently wrongly, to Martin Schongauer—resembles in so many respects the work of this master, that it would perhaps be desirable to have

it critically examined in the light of this new information.

By a recent decree the French School of Art at Athens is placed under the authority of the Minister of Public Instruction, and the scientific direction of the Académie des Inscriptions et Belles-Lettres. Its Director, it is further decreed, must be a member of the Institute, or an officer of public instruction, who is to be appointed for a term of six years. Candidates for membership must be thirty years of age, and have the degree of Doctor of Letters, or Bachelor of Letters, Grammar, Philosophy, or History. They will be required to pass an examination in Ancient and Modern Greek, and the elements of epigraphy, palaeography, archaeology, history, and the ancient and modern geography of Greece and Italy. The number of members is limited to six, and the duration of their mission to three years, including the first year of their membership, spent in Rome. At the annual meetings, subjects for research and for memoirs will be announced, such as the commission think most likely to prove fruitful. Each member will be required to submit every year a personal work for the inspection of the Academy that will be judged by a special commission. Members of the Académie des Inscriptions et Belles-Lettres, and old members of the School at Athens, become by right corresponding associates, and the same title may be conferred without distinction of nationality on any one proposed by the Académie des Inscriptions and the Director of the School of Athens.

THE STAGE.

IF pantomimes are really written and produced for children, and not for those who are glad of the opportunity to go with them, children would naturally be their most competent critics, and the division of literary labour being now what it is, an article from a "specialist" of seven years old, with liberal views and a nursery education, with deep learning in fairy tales, and a wholesome indifference to sorry themes which agitate the mind of the Lord Chamberlain, would no doubt be a welcome contribution to the columns of any well-regulated print. But as no such contribution seems to be forthcoming, we must fall back on the judgments of adult incapacity, and adult incapacity seems to say that of all the pantomimes produced in London that at Drury Lane is the best. Mr. Blanchard, it opines, has been the genial friend of childhood for five-and-twenty years or thereabouts, and he has written *Aladdin* with his common grace. Mr. Beverly's scenery is good again, so that the praise of many years has still to be repeated. The resources of a vast establishment have all been brought to bear in the production of stage wonders. The Vokes family—most popular of pantomimists—have come back from America, with new grace, new antics, and the old good spirits. The young women entrusted with the delivery of the author's lines have followed the stage-manager's instructions to the players—though hardly Hamlet's, perhaps—they have learned at last, after countless rehearsals, to "ladle it out" deliberately, as the *Daily Telegraph* on Christmas Day informed us they were instructed to do. Mr. Chatterton's theatres all boast their pantomimes. Besides *Aladdin* at Drury Lane, there is *The Children in the Wood* at the Adelphi, with little Kate Logan, fresh from the compliments of the Under-Sheriff. At the Princess's there is *Beauty and the Beast*. The Beast is—we forget who, but it doesn't really matter—the Beauty being Miss Kate Vaughan. Mr. Rice has opened Covent Garden with the *Babes in the Wood*: a gorgeous spectacle, they say, worthy of the stage which gave birth to *Babil* and *Bijou*. Mr. Holland, at the Surrey, has produced the *Forty Thieves*. Here are the Payne family, the vigorous Miss Moon, and Mdle. Scasi, who has come from the Alhambra. *Sindbad the Sailor* is at the Holborn, with an actress of some talent—Miss Maggie Bren-

nan—in the principal part. At the Standard, you may follow *Robinson Crusoe* from the day when he leaves Wapping to the day of his dream on the island. Of *Cinderella* at the Holborn Amphitheatre, under Mr. Hollingshead's direction, we have already spoken. The smaller, or less-known theatres, to north, south, east, and west—the Britannia, Victoria, the Pavilion, the Marylebone—are all provided with their pantomimes, and with holiday-folks to see them.

THREE or four West-end playhouses find their old attractions sufficient. The Lyceum with *Hamlet* and Mr. Irving naturally ignores Christmas. The Vaudeville finds that *Two Roses* and *Romulus and Remus* will suffice for the holidays, and Mr. Byron's comedy is therefore still in the background. At the Prince of Wales's people who go to see the *Sweethearts* of Mr. Gilbert stay to see the Owl's Roost in Mr. Robertson's *Society*. At the Criterion the *Prés Saint Gervais* is firmly lodged. At the Strand, holiday people wax merry at *Old Sailors* and Mr. Farnie's bouffonnerie. At the Court, Brighton still attracts, and *Ixion* is at the Opera Comique. Miss Lydia Thompson has gone to the Globe, from the Charing Cross Theatre, and the little house in King William Street is tenanted for a few days by a company playing pantomime, ere Miss Cavendish returns to town with the *New Magdalen*. The Gaiety performance of *The Merry Wives of Windsor* was duly discussed in these columns last week, and here may close our chronicle of the theatrical events of Christmas-tide.

THIS afternoon there will be a performance of Lord Lytton's *Money* at the Gaiety Theatre. With the exception of Mr. Phelps the principal artists now at the theatre will take part in the representation. And this day week there will be a performance of *The Lady of Lyons*, Mr. Kendal playing Claude Melnotte, and Mrs. Kendal Pauline.

THE Royalty Theatre will open at the end of January, we understand, under the management of Miss Dolaro, our best actress and singer in *opera-bouffe*.

MISS FARREN is acting at Manchester during the Christmas holidays.

MR. GEORGE RIGNOLD sails for New York, where he is engaged to act Henry V., in the revival of Shakspeare's plays at Booth's Theatre.

MR. EDWARD RUSSELL, now editor, we understand, of the *Liverpool Daily Post*, and sometime dramatic critic of the *Morning Star*, has written a long and careful and eloquent pamphlet on the Hamlet of Mr. Irving. It is published by Messrs. Henry S. King and Co., and we can at least say of it more than can be said for most productions in the unpopular pamphlet form—it was worth publishing. As a matter of taste we think it is disfigured by the frequent half contemptuous allusions to contemporary writers on the drama as "dramatic reporters." But, taste apart, as a matter of fact no actor of any genuine ability has any reason to complain of the absence of recognition on the part of the critics. The critics, probably, are too happy to find a new light to cherish any desire of hiding it under a bushel. Undoubtedly a good deal of long-accepted experience does still block the way to new talent at the theatres, but the Stage is not the only profession where this phenomenon may be observed, and certainly new ability is recognised by the critics directly the manager allows it an opportunity to be heard. In the particular case of Mr. Irving there is not much to complain of. Opinions must of course differ, but in the main we suppose Mr. Irving has now been pretty generally accepted as the leading actor of his time, and his honours have been promptly won and not grudgingly bestowed.

To come to the matter of Mr. Edward Russell's pamphlet, the author's endeavour is to show what new features the new Hamlet possesses. He takes

as his motto the "Now I am alone" of the second scene of the second act. Mr. Irving, he says, has noticed that Hamlet "is not merely simple-minded, frankly susceptible, and naturally self-contemplative, but has a trick—not at all uncommon in most persons whose real life is an inner one—of *fostering and aggravating his own excitements*." And he further adds: "The vivid, flashing, half-foolish, half-inspired, hysterical power of Irving in the passages where it is developed, is a triumph of idiosyncrasy, which, even with the help of the traditions he is founding, is not very likely to be achieved by any other actor." It is not so much, however, in throwing new light on the performance to those who know the performance well, or in throwing new light on the character to the many who know the character well, that Mr. Russell excels. It is in seizing the individuality of the actor, and sketching very vividly for all readers the outline and manner of his representation. The following passage, for instance, contains several true and penetrating observations:—

"While believing that Hamlet may be successfully played with almost any physique which is not obnoxiously unromantic, we avow the opinion that such a physique as Irving's—nervous, excitable, and pliant, suggestive of much thought and dreamy intellect, yet agile and natural and individual in its movements—comes nearer the normal English preconception of such a character than one more characterised by physical beauty and gesticulatory and elocutionary grace. In moments of high excitement Irving rapidly plods across and across the stage with a gait peculiar to him—a walk somewhat resembling that of a fretful man trying to get very quickly over a ploughed field. In certain passages his voice has a querulous, piping impatience which cannot be reconciled with stage elegance. But there is no reason why Hamlet should not have had these peculiarities; and if we are to see him really living in the midst of what has come upon him, the genius of the actor who accomplishes this all-important feat as only genius can, will be distinctly helped by any little ineffaceable peculiarities which, while not inconsistent with the character, give the representation of it a stamp of personal individuality. This, though a minor characteristic, has greatly distinguished Irving's acting in all his noted parts. . . . In each case—in Digby Grant, Mathias, Eugene Amm, Philip, even in the necessarily stilted King Charles, and, in spite of too young-looking a countenance, most pre-eminently in Richelieu—play-goers have felt that they have come to know a new and distinct and actual person, just as really and with just as true a sensation of novelty and kindled curiosity as when an interesting acquaintance is made at a dinner-table or in travelling. The secret lies in a bold combination of tragedy with character acting, which Irving has been the first to essay."

Mr. Russell is not quite satisfied with Irving in the opening of the scene between Hamlet and his Mother. He does not, he says, give the usual force to the question, "Is it the King?" in which "Charles Kean was, and Sullivan is, great. The idea that Hamlet is startled into the most vehement excitement by the thought that he has done upon hazard the deed for which he has been trying to nerve and prepare himself, does not appear to have been so overpoweringly present to the new Hamlet as to his predecessors." But it may be rejoined, when Hamlet makes the pass through the arras, he naturally thinks the King the most likely person to be in his mother's chamber; hence the quietness of the question "Is it the King?" Mr. Russell having traced the whole course of the Lyceum performance, and commended, by-the-by, that gesture of the lifted hand to the sky in the last moment, which the *Spectator* pronounced against and which the actor has we believe now abandoned, concludes in the following terms an eloquent and thoughtful eulogium:—

"So dies Hamlet—but lives immortal; henceforth more than ever a pathetic ideal of refined humanity, torn and wrecked upon cruel and coarse troubles; of young philosophy; of peering irresolution; of awed yet venturesome imagination; of wayward trickiness;

of religion faintly clouded with doubt, yet clear in tenderness of conscience and purity of sweet counsel; of love, domestic and sexual, embittered and shattered; of a heart riven by the sorrow most trying to it; of powers coping with problems horrible either to be mastered by or to master; of thoughts teeming with imagery and conjecture, on which the world never tires of meditating; of a fate, fitfully shunned, recklessly challenged, and at last encountered by mere chance medley; of many other things, also, which even Shakspeare can barely express, and about which lesser men can only wrangle.

"To present this matchless figure worthily and vividly to the men of his time has been the highest ambition of every great actor, and that ambition Henry Irving has abundantly attained. To prove it, we have dwelt not on his general philosophical sublimity or tragic grandeur, in which he could but rank with noble predecessors, but on the features of Hamlet's being he has especially revealed and illuminated. In this character a thousand undying beauties and significances of art have been piously cherished from age to age. To Irving belongs the merit of snatching—with a hand feverish, perhaps, but sure—graces which were not, and can hardly become, in a stage sense, traditional. He has made Hamlet much more, and something more ethereal, than a type of feeble doubt, of tragic struggle, or even of fine philosophy. The immortality of his Hamlet is immortal youth, immortal enthusiasm, immortal tenderness, immortal nature."

AN anonymous contributor to *Macmillan's Magazine* has an article on "The New Hamlet and his Critics." The contributor's great charge against Mr. Irving's critics is that they have praised him over much, and his great charge against Mr. Irving is that his performance is melodramatic. That is what many people expected it to be; that is what it proved, we think, not to be. The contributor to *Macmillan* writes of the play like a scholar, but of the acting like a novice. It boots not, therefore, to discuss with him the grounds of an opinion generally adverse. Common premises would be wanting to the discussion, for the *Macmillan* critic is continually blaming Mr. Irving for having failed to convey to him just those impressions which to most of us the actor did convey so distinctly.

OFFENBACH's long-expected piece, called *Whitington*, has been produced at the Alhambra. It is a long spectacle, with choruses and ballets, as all Alhambra pieces are.

DEJAZET, profiting by the temporary enthusiasm got up on her behalf some months ago on the occasion of her benefit—when half the actors and actresses in Paris appeared before half the people of the great world—has engaged to give a series of representations at the Paris Vaudeville, and these performances have now begun. Born in the last century, Dejazet carries into our day some of the stage traditions that she alone can possess. Her delivery of a couplet and her exact and formal and very clear pronunciation are things to be remarked on now as curiosities. She plays an old woman of sixty-five—being herself a dozen years older—and it is, perhaps, only good-natured fiction and not history which reports that she has to paint wrinkles every night, for her part, so that she may manage to look old enough to fill it.

ONLY two or three weeks ago we told the story of Sardou's *La Haine*—the great drama at the Paris Gaité, which, though it could not be well reported of on the whole, still, in consequence of some dramatic qualities and much splendour of mounting, bade fair to be performed for several months to come. It has suddenly been withdrawn. Offenbach informed Sardou that it was no longer paying its nightly expenses, and Sardou forthwith requested that it should be played no more. *Orphée aux Enfers* is now played instead of it, and the Gaité will not in future venture on any drama of an ambitious kind.

Philiberte, a charming little comedy by Emile Augier, has been revived at the Français, for the

second *début* at that theatre of Mdlle. Emilie Broisat who comes from the Odéon. The revival has been entirely successful. The piece was played first of all at the Gymnase, when the most important part was played by Madame Rose Chéri. The impression made by Mdlle. Broisat's art is highly favourable, though it is objected that she is too handsome for the part, and that it would have fitted better Mdlle. Blanche Baretta (who is coming to the Français), and for whom the celebrated line

"La grâce, plus belle encore que la beauté" might have been expressly written.

PHÈDRE, which was performed at the Français on the anniversary of Racine's birth, was repeated on Tuesday before the Tuesday subscribers to the theatre, Mdlle. Sarah Bernhardt having, in the difficult laborious part of the heroine, almost surpassed expectations sure originally to have been high. The fourth act was too much for the actress's physical force, but her conception was good throughout, and her execution good and striking at most points. One says at once, writes M. Caraguel, "avec quel soin elle avait étudié et composé ce personnage de Phèdre, qui était le triomphe de Rachel, et qui a été depuis l'écueil de plus d'une tragédienne. Le succès a été très grand et aussi complet qu'il pouvait l'être; je veux dire que Mdlle. Sarah Bernhardt a pleinement répondu à l'attente du public. On était sûr d'avance"—and here M. Caraguel describes with more happiness than usual the characteristics of the artist—"qu'elle apporterait dans ce rôle nouveau pour elle les qualités éminentes qui la distinguent: un grand sentiment poétique, une diction harmonieuse, le goût et la mesure, et cet art savant du geste noble et des attitudes sculpturales par où elle rappelle quelquefois Rachel." Mdlle. Bernhardt will be seen in London in due time—when some of her great qualities are gone, probably.

MUSIC.

NEW MUSICAL PUBLICATIONS.

"THE Rose's Pilgrimage," a fairy tale taken from a poem by Moritz Horn; composed by Robert Schumann, Op. 112. Vocal Score. The English translation by Constance Bache. (Stanley Lucas, Weber & Co.) Schumann's most poetic and charming cantata *Der Rose Pilgerfahrt*, deserves a far more detailed notice than is possible in these columns. The exquisite little poem by Moritz Horn supplied him with a subject which exactly suited the peculiar vein of his genius. The argument may be given in a few lines. A rose desiring to know what love is, prays to the Queen of the Fairies that she may be changed into a mortal maiden. Her prayer is heard, and the Queen gives her a magic rose-bud, which will ensure her earth's greatest pleasures so long as she retains possession of it. If once she loses it, however, she must die, and become once more a mere flower. The Rose-maiden passes through various adventures, loves, marries, and becomes a mother. She then places the magic rose-bud in the hands of her infant, dies, and becomes, not (as foretold) once more a rose, but an angel to watch over her little one. The music to which Schumann has set this pretty fairy-tale differs in several important respects from that of most of his other large works. Its general character can be most exactly described by the German adjective "volkstümlich"—not merely "popular" music in the ordinary sense of that term, but music written in the spirit, and to some extent also in the form, of the "Volkslied." There are but few largely developed movements, the most important being the Hunting Chorus (No. 16), the two Wedding Choruses (Nos. 21 and 22), and the scene between the Rose and the Queen of the Fairies, with the Charming Fairy Chorus alternating with the solo parts. The greater part of the music consists of short and comparatively simple solos and duets. That the character of the

whole is thereby rendered somewhat fragmentary cannot be denied; but the grace and beauty of the individual portions is such, that in spite of this defect the interest is well sustained. The whole work is comparatively so easy of execution that it has only to be known to become a favourite with amateur musical societies, who will find it quite within their reach. It is at the same time of sufficient importance to be worthy of production at important concerts—such, for instance, as those at the Crystal Palace. The English version of the words is very good.

The Songs of Wales. Edited by John Thomas. (Cramer and Co.) This handsome octavo volume of nearly 400 pages contains, as stated in the preface, "a larger amount of the National Music of the Principality than any other work." Here are reproduced, not only the entire contents of the three volumes edited by the late John Parry, and of the three edited by Mr. George Thomson, of Edinburgh, but also a certain number of Welsh melodies added by the present editor, and not comprised in either of the works named above. Those who are acquainted with Welsh music will not need to be told of the peculiar and wild charm of many of the melodies; those to whom they are unknown cannot do better than procure this work, in which they will find very much worthy of their attention. A special feature of this volume, and one which will render it particularly interesting to musicians, is, that of many of the airs two or three arrangements are given by various composers, affording an opportunity of comparing the treatment of the same melody by different hands. There are eighteen airs harmonised by Beethoven, and forty-one by Haydn, the other principal arrangers being Kozeluch, John Parry, C. H. Purday, and the present editor, Mr. John Thomas. Many of the songs are also given not merely as solos, but as part-songs. The whole work is preceded by an interesting historical introduction by Mr. C. H. Purday. The "Songs of Wales" forms a valuable addition to the existing collections of national music.

Praise the Lord. A Sacred Cantata, composed by Jacob Bradford, Mus. Bac. Oxon. (J. Mac Dowell & Co.) This cantata was composed as Mr. Bradford's exercise for his Bachelor's degree. Its object was therefore to show the extent of his knowledge and technical acquirements rather than of his inventive talent. As a general rule works written to order, or for special occasions, afford no fair indication of the abilities of their writers; nor would it be just to judge of Mr. Bradford from the present cantata, except in so far as it gives proof of the thoroughness of his studies. The ten numbers of which the work consists are for the most part amply (sometimes too amply) developed; they contain much good writing, especially in the stricter styles of composition, but show comparatively little individuality, and are in places somewhat dry. The cantata as a whole does credit to the musical education of the composer, who is (as appears from the dedication) a pupil of Sir John Goss; in other respects it is only right to reserve an opinion as to his powers.

A Manual of the Elements of Vocal Music, for School Use, by F. Leslie Jones (Longmans, Green & Co.), is a very excellent and practical little treatise. Mr. Jones evidently understands his subject, and knows how to teach. He adopts the system of singing by key-relationship, which is undoubtedly the easiest as well as the best method of learning to sing at sight. Within the compass of some eighty pages a large quantity of matter is contained, by no means the least valuable part of which will be found the hints to teachers as to the best methods of imparting instruction. This little book can be heartily recommended.

It is impossible in a paper the musical department of which forms a comparatively unimportant portion of the whole, to keep pace with the activity of the periodical press. We cannot therefore notice in detail the contents of the recent

numbers of the *Musical Monthly* (Enoch & Sons), and the *Organist's Quarterly Journal* (Novello, Ewer & Co.), which lie before us. It must suffice to say that an examination of them shows them to be fully up to their average of excellence, and that those who are in search of novelties, whether for the organ, piano, or voice, will find in these publications pieces adapted to the most varied tastes. He must be hard to please who does not meet with anything to his liking.

From among an accumulation of songs and piano pieces awaiting notice, may be selected for special mention the song "Why didst thou ever leave me?" by Charles Salaman (Lamborn Cock), a very graceful and elegant little piece, in the somewhat unusual form of a recitative and air; the song, "Thy Spirit's low replies," by Rosetta O'Leary Vinning (same publisher), a very good and by no means commonplace song; "Sunshine," by Berthold Tours, and "The Coming Year," by Gabriel Davis (Wilkie, Wood & Co.); also two very pleasing part-songs, by Charles Salaman (Novello, Ewer & Co.), one of which, "There is an hour," is written for mixed voices, while the other, "Fair is the swan," is for an alto, tenor, and two basses. In piano music can be recommended No. 4 of *Wayside Sketches*, by Arthur O'Leary (Novello, Ewer & Co.), which, though only a "sketch," is a very interesting little piece; a well-written "Impromptu" by Westley Richards (Lamborn Cock); a set of variations by the same on "Drink to me only," somewhat old-fashioned in form, but clever and brilliant; and, lastly, a "Concert Study" by J. Baptiste Calkin (Ashdown & Parry), which is an excellent exercise on double notes.

EBENEZER PROUT.

A LAW-CASE of some interest to singers is recently reported from Breslau. Frau Robinson, a well-known opera-singer of that town, had a clause in her agreement with Herr Schwemer, the manager of the theatre there, that certain rôles of her repertoire were to be reserved for her exclusively. Toward the close of her engagement disputes arose between her and the manager, one cause being that Herr Schwemer had at various times given her parts to other singers. As the agreement provided that he should in such case pay a penalty of 3,000 thalers, the lady brought an action for two breaches of contract, laying the damages at 6,000 thalers. In the result, the Court ordered the manager to pay 3,000 thalers (450*l.*)

RICHARD WAGNER has recently visited Leipzig, and attended a performance of Spohr's *Jessonda* at the opera there; the object of his visit being to find more singers for his Bayreuth performances. How far he has been successful we have yet to learn.

THE Italian Opera at Brussels is to open during the present month with three of Mozart's operas, *Figaro*, *Don Giovanni*, and *Così fan tutte*.

It is stated by the *Neue Zeitschrift für Musik* that the bazaar in aid of the Bayreuth celebration, which was lately held at Berlin (as mentioned in last week's ACADEMY), realised nearly 11,000 thalers (1,650*l.*)

LACOCQ's comic opera *Giroflé-Girofla* achieved a great success last week at Berlin, when it was produced at the "Friedrich-Wilhelmstädtische Theater." The same opera is in rehearsal at the Carl-Theater in Vienna, where *La Fille de Madame Angot* has been performed nearly 150 times since last January.

DR. OSKAR BERGGREN, the director of the Vienna Branch of the International Mozart Institution at Salzburg and of the Vienna Wagner Society, has come to London in the interest of those two societies. We hear that a branch of the "Mozarteum" is being founded in London under distinguished patronage, and we shall shortly be able to give full particulars.

MESSRS. CASSELL, PETTER, & GALPIN'S ANNOUNCEMENTS.

DR. FARRAR'S LIFE OF CHRIST.

ELEVENTH EDITION, NOW READY,
In 2 vols. price 2*s.*

THE LIFE OF CHRIST.

BY THE

REV. F. W. FARRAR, D.D., F.R.S.

Master of Marlborough College, and Chaplain in Ordinary to the Queen.

* Also in Morocco Binding, suitable for presentation.

From the TIMES.

"No thoughtful mind will rise from the perusal of this book without feeling that it reveals a beautiful and a harmonious concept. It will serve to raise the mind from mere objections in detail to a comprehensive view of the whole subject, and it will at the last meet candid objectors to do justice to the Christian tradition."

From the INQUIRER.

"The volumes proceed from a mind of a ripe, erudite, thoughtful, earnest, truthful, and sincere. An honourable and great peculiarity of these volumes is the utter absence of an uncharitable spirit. The work is admirable in tone and temper throughout. It is a man of very considerable attainments and extensive reading, a elegant writer, and a Christian gentleman of refined feeling, we readers, we hope, will procure the work, and judge of it for themselves."

POPULAR SCIENTIFIC WORKS.

NEW AND CHEAPER EDITION.

Demy 8vo. 7*s.* 6*d.*

The TRANSFORMATIONS OF INSECTS.

By Prof. P. MARTIN DUNCAN, M.D., F.R.S. Being an Adaptation for English Readers, of M. Emile Blanchard's "Métamorphoses, ou l'histoire des Insectes," and a Companion from the Works of Newport, Charles Darwin, Spence, St. J. Müller, Packard, and others. Illustrated with 40 Full-Page and other highly-finished Engravings.

"So many new lights have been shed upon the natural history of the great and varied group of animals, that it was quite time for our work of entomology to be provided with a new and trustworthy account of insect life. Dr. Duncan has well supplied this want.... A beautiful illustrated work. It will make an admirable gift-book for old and young naturalists."—*Athenæum*.

NEW AND CHEAPER EDITION.

Price 10*s.* 6*d.*

The WORLD of the SEA. Translated from

the French of MOQUIN TANDON by the Rev. H. MARTIN HART, M.A. Demy 8vo. 4*s.* pp. with numerous Wood Engravings.

"A volume of deep interest, full of knowledge and interest." "It is a book of rare merit."—*Guardian*. "One of the most popular books on the subject."—*Land and Water*.

THE NEW AND CHEAPER EDITIONS OF

LOUIS FIGUIER'S

POPULAR SCIENTIFIC WORKS.

Containing all the original Illustrations, the Text revised and corrected, price 7*s.* 6*d.* each, complete.

The WORLD before the DELUGE. With 233 Illustrations. Fourth Edition. Revised and Corrected by W. H. BRISTOW, F.R.S.

"We find in 'The World before the Deluge' a book worth a thousand gilt Christmas volumes, and one most suitable as a gift to intellectual and earnestly inquiring students."—*Athenæum*.

The OCEAN WORLD. With 437 Illustrations. Third Edition. Revised and Corrected by Professor E. PERCIVAL WRIGHT, M.D.

"A fine copy of a noble book."—*Birmingham Post*.

The INSECT WORLD. With 576 Illustrations. Third Edition. Revised by Professor DUNCAN, M.D., F.R.S.

"The book is an excellent one, and admirably got up."—*Educational Times*.

The VEGETABLE WORLD. With 470 Illustrations. Third Edition. Revised and Corrected by an Eminent Botanist.

"The present is the best edition of the work that has appeared, as far as botanical value is concerned."—*Garden*.

REPTILES and BIRDS. With 300 Illustrations. Second Edition. Revised and Corrected by Captain PARKER GILLMORE.

THE DORÉ FINE-ART VOLUMES.

SATURDAY, JANUARY 9, 1875.

No. 140, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscripts.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Speeches of Lord Lytton, now first collected, with some of his Political Writings hitherto unpublished. And a Prefatory Memoir by his Son. In Two Volumes. (Edinburgh and London: Wm. Blackwood & Sons, 1874.)

NOTWITHSTANDING the eminence attained by the late Lord Lytton in so many different branches of literature, in poetry, in the drama, and in fiction, it is nevertheless strictly true that he was by no means a good English scholar. We have been struck in reading these volumes with the frequent recurrence of wrong words, clumsy constructions, and slipshod grammar; and we think that in some instances his editor could have done well to correct them. For example, "The ministers to whom we owe these guarantees of order and prosperity, so long as they remain sensible of their true position, the position of a mediating government between perilous extremes, must continue to represent the only administration worthy of public confidence." Ministers do not represent an administration. They are an administration. Again, "Throughout all the Germanic nations I know not one in which we are not viewed with resentful mistrust, or which does not hear with a scornful smile of our own preparations against the danger for ourselves in which we have declined all sympathy with the fears of others." What is "in which"? Or, again, "Time is on the side of every agency which resolves into their ancient conflict that union of every element which informs states and nations with individual vitality and soul." "Their conflict" should be "its conflict;" and even then the English would be very queer. It is a pity, we think, that Lord Lytton did not take more pains to make his fiction worthy of his eloquence, the ablest specimens of which are occasionally spoiled by this laxity, the last quoted sentence in particular occurring in one of his finest perorations containing one of the happiest storms on record.

We learn from the "Prefatory Memoir" that Mr. Bulwer entered Parliament in 1831, for the borough of St. Ives; and that in the first reformed Parliament he sat for Lincoln. At this time he was a Liberal, but a strong Protectionist; and one reason why he selected Lincoln was that the electors of that town were all in favour of the Corn Laws. He retained his seat through the general elections of 1835 and 1837, but lost it in the Conservative reaction of 1841. And from

that date he remained out of Parliament till 1852.

"During the ten years in which he had sat in Parliament on the Liberal side of the House, he had spoken and voted against the still tolerated property in slaves. He had, both by his speeches and his writings in the *New Monthly* (which he then edited), energetically opposed the Coercion Bill for Ireland, and the coercion policy in Canada. He had obtained an Act conferring copyrights on dramatic authors, and had originated what ultimately led to international copyright. He had obtained important ameliorations in the taxation of newspapers, and prepared the way for the complete abolition of all imposts upon public information. He had by his contributions to political literature suggested many of those reforms which have since been effected in the Poor laws. He had supported the amendment of the Factory Act of 1833, and had urged the removal of the site of the Royal Academy from the National Gallery—a change which was effected thirty years later. He had spoken and written in defence of the principle of an Established Church, but also as an ardent advocate of justice to Dissenters on the question of Church Rates."

He had also obtained the appointment of a Parliamentary committee to enquire into the monopoly then enjoyed by the two Royal Theatres, an enquiry which unfortunately has not answered the purpose for which it was suggested. The present Lord Lytton complains that during the eleven years of his father's absence from the House of Commons the local agents and political leaders of the Whig party "consistently endeavoured to prevent his return to Parliament," though he had contributed largely to Lord Melbourne's recovery of power in 1835. His *Letter to a late Cabinet Minister*, published in the autumn of 1834, had, according to the present Lord, a prodigious effect upon the public. Fourteen editions of it were sold in a fortnight; and it reached twenty editions at the price of 3s. 6d. Lord Melbourne himself is said to have assured the author that his pamphlet had done a great deal to turn the scale at the general election, and to prevent a Conservative majority. This is a very interesting statement, and makes us curious to see this production of Lord Lytton's pen; since we scarcely should have thought that his style was suitable to the treatment of popular politics. That it proved effective in this case, however, seems beyond a doubt; and certainly if the Whig party showed their gratitude in the way we have described, they deserved no more support from literature. As late, however, as 1846, Sir Bulwer Lytton seems still to have been a Liberal, as in that year he addressed a series of letters to Lord John Russell, on his return to power, in which he spoke like an adherent. He remained a Protectionist, however, to the last, and in 1852 he was returned for Hertfordshire as an avowed supporter of Lord Derby. On this occasion the following scene took place at Hertford:—

"The farmers who supported those candidates had ridden into Hertford early on the nomination day, and endeavoured to occupy the ground in front of the hustings. But this heavy cavalry was ignominiously routed by a severe fire of stones and brickbats, and the field of battle remained in possession of a body of roughs from Ware—the foot-soldiers of the Liberal army."

"The attempts of the two senior Conservative candidates to obtain a hearing from this hostile audience failed lamentably; but when, after some

helpless gesticulation in dumb show, they retired to the back of the booth, and my father advanced to the front of it, the storm of yells and execrations broke out with redoubled fury. Under the hustings, and on a level with the crowd, was a small balcony erected for accommodation of the reporters of the London Press; and in it those gentlemen, having nothing to report but inarticulate noise, were seated like the gods of Epicurus, who

"Smile, and find a music centred in a doleful song, Like a tale of little meaning, though the words are strong."

"Suddenly there broke from the crowd a cry of surprise, succeeded by a silence of curiosity. On to the reporters' table in this balcony my father had leapt down from the hustings above it, upsetting the ink-bottles, and scattering the pens supplied to record his discomfiture. He was determined to be heard, and he was heard. He had gained all he needed—a moment's silence. Wisely refraining from any attempt at a set speech, he entered into conversation with the noisiest of the hostile ringleaders, mollified the man by a good-humoured joke, shook hands with him, drew him into a humorous argument, and then slid imperceptibly from personal conversation into public speech. He spoke, I think, for an hour or more; and was listened to in the most respectful silence, interrupted only by the most cordial cheers."

We have always understood that the late Lord Lytton was a very successful canvasser, and knew how to make himself popular with the farmers and tradespeople. In 1858 Sir Bulwer Lytton was Colonial Secretary, and distinguished his brief tenure of office by the creation of a new colony, British Columbia. At this time he wrote a letter to Mr. George Bowen on the duties of a colonial governor, which is here republished, and is certainly a very able paper. Lord Lytton was prevented by his health from joining the third Cabinet of Lord Derby, and for the same reason never spoke in the House of Lords, though he once moved the adjournment of the debate, and prepared a speech for the occasion. But when the time arrived he was unable to deliver it.

The oratory of Lord Lytton was of a highly ornate character, abounding in classical allusions, and gemmed with richly-wrought periods. But his diction lacked purity; and his constructions are sometimes more inelegant than can be excused even by the heat of debate. His speeches, moreover, were generally prepared beforehand, so that he had not even that apology to offer. They had not a great deal of power, nor a great deal of nature. But they were dignified, and eloquent with that kind of eloquence which most professed men of letters are able to summon up at times. Some of his most highly finished passages rise to a considerable height, and one from which we have already quoted is perhaps as good of its kind as anything which living men have ever heard within the House of Commons. Mr. Gladstone had said (1866) that "time was upon his side." "Yes," said Sir Bulwer Lytton, "it is so"—

"Time is on the side of all destroyers. Time is on the side of every agency which resolves into their ancient conflict that union of every element which informs states and nations with individual vitality and soul. Time, while we speak, is, no doubt, at his silent work upon this old Commonwealth of ours. Even at the moment when it will seem to posterity an act of madness on our part to hazard by experiments fatal to every an-

cient state in which they have hitherto been tried, the doctrines of a race which unites a freedom that seemed hopeless to the philosophers of Athena, a commerce that would have seemed a fable to the merchants of Tyre, with an empire unknown to the Roman Caesars, and unconceived by the wildest dreams of Alexander. Yes, no doubt, Time is on your side. But Time is the enemy, and not the friend of genuine patriots and careful statesmen. For it is their task not to hasten, but delay to the longest period permitted to human hope, and to human genius, the ultimate victory of Time in the decline and downfall of their native land."

This is a good specimen of Sir Bulwer Lytton's eloquence at its best. But even here it will be seen that there are common expressions which detract a little from its effect. "The doctrines of a race" is surely very awkwardly situated. And the last sentence of all is not as well chiselled as it ought to be. After "the victory of Time" one expects the word "over," not "in." Or if we keep the latter, then we require some such word as "struggle" or "contest" after it. Lord Palmerston told the Queen that one of Sir Bulwer Lytton's speeches on Reform was one of the finest he had ever heard delivered in the House of Commons. This we suppose was in 1860. The speech certainly is a very good one, and, like most good speeches, was better perhaps to hear than to read.

The opinions of Lord Lytton were perfectly independent and original. On several important questions he differed from his party entirely: and not questions of a kind to which his previous Liberal connexions had in any way committed him. For instance, he was very much opposed to the transfer of India to the Crown. He also disapproved of what was at this time a favourite policy with the Tories, namely, the Anglo-French alliance. And as far as can be gathered from the tone of his letters, he disapproved of that growing inclination towards peace with Russia which began to show itself after the fall of Sebastopol. In some of these letters he refers to the *Press* newspaper, which was then the acknowledged organ of the Tory leaders, and condemns the pacific policy which it advocated. His son says: "He has every reason to believe that this tone was not inspired by the chief of the Conservative party." We not only know that it was so inspired, but we think it was inspired wisely. If Lord Lytton will turn to the columns of that journal for the autumn months of 1855, he will find several articles pointing out the tendency of wars to outgrow their original design. A war begun for one object is often continued for another. And what was originally a defensive war, too often drifts into an aggressive one. It was feared that the Crimean war might run some such course as this if peace were not made when its primary object had been gained. The Tory party fancied they discovered in Lord Palmerston some disposition to prolong the war for the purpose of humiliating Russia, after we had gained our point by securing the integrity of Turkey. Lord Lytton, we think, will find that this was the true state of the case; and though the Tories may have been mistaken, there was nothing inherently improbable in the supposition which they acted on, and certainly nothing which deserves the epithet

of fantastic. On the subject of our foreign policy in general a great many people at the present day will probably agree with the late Lord: namely, that the old-fashioned Austrian and Russian alliances of the eighteenth century were more valuable to England than the French one. But the policy of Austria and Russia, no less than that of France, has changed a great deal from those days; and we must not judge the Anglo-French alliance of 1854 from the point of view at which we stand now.

Lord Lytton left an interesting fragment behind him on the "Genius of Conservatism," which displays a good deal of thought and considerable discrimination. His remark that the nobility of France was never an aristocracy in the proper sense of the term—that is, a governing class in the country—though the distinction is rather an arbitrary one, points to a fact which explains a great deal of the history of the nation, as well as its present leaning to autocratic government. Lord Lytton is perfectly right in saying that Conservatism and Toryism are two very different things. But he has not put the difference quite correctly. Conservatism, he says, would maintain all those institutions which harmonise with the genius of the nation, no matter what they are. Thus, Conservatives are democrats in America, aristocrats in England, and imperialists in France. It may be objected to these illustrations that republicanism is as much a national institution in America as democracy. But to waive the question for the present, he describes Toryism as the creed which favours a particular form of government, namely, the monarchical, and views with suspicion the exercise of power by the people. It is quite true that the essence of Toryism is monarchy, but it is untrue that it begins and ends with that. The history of Toryism in this country is a history of the struggle between national instincts and traditions, and the attempt to naturalise exotic ones. The English people, for instance, always cling to the idea of their old national Royalty as something distinct from either a doge or a despot. Likewise, down to very recent times, if not still, they cling with equal tenacity to the idea of the National Church, as is shown by a succession of popular demonstrations during nearly a century and a half. Toryism, then, though the embodiment of special, ecclesiastical, and political principles, is also equally national with, and more truly popular than, Conservatism.

We look forward to the *Life of Lord Lytton*, promised us by the present Lord, with extreme interest. It ought to be, we think, among the dozen best biographies in the language. T. E. KEBBEL.

Letters from India and Kashmir. Written 1870. Illustrated and annotated 1873. (London: George Bell & Sons, 1874.)

Most modern books of travel, perhaps to an even greater extent than most modern works of history or fiction, illustrate the restlessness of modern thought and action, the changes that have been wrought in the methods and circumstances of daily life, the impatience and tendency to run in a groove

that is the bane of modern civilisation. Steamboats and railways have not more surely put galleys and coaches to flight, than statistics, agglomerated facts, and more or less accurate compilations, the personal observation, the proved experiences, the early charming garrulousness of elder times and travellers. Much more "general information" is gathered together, but the dramatic and personal element is for the most part missing, and events succeed each other with such rapidity in narratives of world-circling journeys, that they leave no more impress on the mind than the sliding scenes of a magic lantern. The gap is not greater between the writings of Froissart and Macaulay, than between those of modern travellers and their predecessors Columbus, Varthema, Friar Jordanus, Marco Polo, and such like, into whose pages haste and noise enter with as measured a ceremony as the cumbersome pageantry of war upon the stage of their day.

Perhaps the slow processes of persistent action are not modern virtues. Young, rich, and leisured Englishmen are not apt to spend their time in patiently exploring antiquity in her remotest citadels, or in founding empires; but to scamper round the world at steam pace, to be fêted in civilised, and shoot in uncivilised regions, to record in print the time-honoured gossip of the colonies visited, to get a general idea of "what's interesting," or to "say" they've been there, is what all who have vitality of nature and wit may do, and do nowadays.

This being so, it is refreshing to come across such a book as the volume before us, combining as it does much of interest contained in the works of earlier chroniclers, with the aspects of modern travel for a year in India and Kashmir, of which it is so pleasant a record. The writer of the work has compiled it from letters written home at the time of the journey, rightly judging such sketches, done on the spot, to have a charm not always belonging to more finished pictures. The letters, which are written with admirable taste, and contain a good deal of miscellaneous information, have been carefully pruned; and the lengthy tediousness of a narrative of "board ship" life has wisely been omitted.

Passing by Perim, "first garrisoned by the British in 1799," down the sea spoken of by Sir John Mandeville, in 1366, as "*not more read than another Sea*," the writer reaches Aden, of which a lively and interesting account is given, not omitting notice of its nine fine reservoirs for rain-water, mentioned by Ibn Batuta in 1324, and restored to use by the British Residents, Sir William Coghlan and Sir William Merewether. Aden was the first conquest of Her Majesty's reign, being taken in 1839 by 700 European and native troops, under command of Major Baillie, in restitution for treaties broken and violence offered, by the Arab Sultan, to a crew of British subjects three years before.

Of Bombay (the second city, by the way, not the third, in point of population in the British Empire*), of her lovely position, her

* The population of the three principal cities of India, as per last census, were: Bombay, 644,405;

palm-girdled bay backed by the blue hills of Matheran, her crowded bazaar, her shadowy cave-temples and mysterious Towers of Silence, much is to be said, though the writer went too late to India to be aware how completely the aspect of the old unhealthy wall-hemmed-in city had been revolutionised since 1862.

Bombay and Tangier came into English possession in 1662 as part of the dowry of the Queen of Charles II. Baldoens in 1672 mentions both as "places of no considerable traffic," and Bombay being found unproductive to the Crown, was rented of the King by the East India Company from 1668 for a yearly rent of 10*l.* in gold. In the same year the company sent their first order "for 100 lb. weight of the best tea"—the export trade in which has for the last ten years "exceeded eighteen millions." Calicut, the home of the comely Nairs, where Vasco de Gama first landed, and whence calico derived its name and fame, appears to be still celebrated for the beauty of its inhabitants; though the method taken by them to enhance it, and observed by Master Caesar Fredericke, in his *Eighteen Yeeres Indian Observations*, in 1563, still prevails. "The Nairs," he says,

"and their wives use for a braverie to make great holes in their eares, and so big and wide that it is incredible, holding this opinion, that the greater the holes bee the more noble they esteeme themselves. I had leave of one of them to measure the circumference of one of them with a threed, and within that circumference I put my arm up to the shoulder, clothed as it was, so that in effect they are monstrous great."

Of the Todas, the aborigines of the Nilgiris, and of the curious life-size terra-cotta idols of the Coimbatore district, of which "some," says Mr. Ralph Fitch, in 1583, "bee like a Cow, some like Monkeys, some like Buffles, some like Peacockes, and some like the Devill," much interesting information is given, on which want of space alone forbids our commenting.

"The scenery of the Coonoor Ghaut is," the writer says, "enchanted. . . . Detained at Ootacamund later than was intended, the shades of night had fallen before we reached the plain; but a crescent moon shone through a rift in the clouds, and disclosed the deep shadows of the wooded ravine, from which arose the roar of a mountain torrent. The fascination of the scene was indescribable, when, as the night grew darker, myriads of fireflies lighted up an illumination in the groves. The colour of the leaves they most affected was made distinctly visible by the lights floating round them, and some of the most favoured trees led you to fancy that the whole fairy court, out on its revels, was celebrating with befitting splendour some royal festival."

Passing by the cathedral of Cochin, in which Vasco de Gama was buried, and which merits a visit both for its own sake and for that of the tombs it contains; Ceylon, that "demi-Paradise," and the rock-hewn city of Mahabalipur, we come with speed, *via* Madras, to Calcutta. Of the present increasing facilities of transit in India, the writer observes that they

"are modifying the character of peoples so divided

by races, languages, and religions, that to amalgamate them would seem a hopeless task, though it is being accomplished by patient counsels. Such too is the spread of education, through the efforts of Government, private benevolence, and missionaries, that it is believed most of the inhabitants of Southern India will within twenty years speak the English language, and thus have a common bond in a national tongue."

We fear this view of the progress of civilisation and culture is somewhat over-sanguine.

That there is still an ample demand in India for the exertions of the British sportsman, is attested by the fact that "during the last fifteen years, in Bengal alone, 13,400 men, women, and children have fallen victims to tigers, leopards, and other beasts of prey." Of Calcutta, the population of which is, however, to judge by the latest census, greatly overestimated by the writer, an account is given that shows how sorely the just completed water supply and drainage works were needed—the absence of which was the fruitful source of epidemic cholera and fever. The enhanced price of living, consequent on the increasing prosperity of the country and the unequal balance of the imports and exports, presses in Calcutta, as elsewhere in India, more and more heavily every year upon fixed incomes, such as those of our Government servants; a fact that those who deprecate all increase to their salaries, and yet profess a wish to maintain the present tone and efficiency of the public services, ought to bear in mind.

Bank notes of the Indian Government pass at par in most of the large cities, but in the more remote regions native bankers charge a heavy discount on them. When the native public becomes convinced that the paper currency is a secure convertible medium at the Government banks, not liable to depreciation, "it will," as the writer justly observes, "be the greatest innovation in our Eastern Empire." *Aprpos* of representative money, mention is made of the copper currency adopted in lieu of gold by Sultan Mahommed Toghluq in the fourteenth century, who, wanting money to "conquer seven regions," issued, according to a contemporary account, orders that

"just as in China a paper-gold is current, so, too, in Hindostan, they should coin copper-gold in the mint, and make it pass current instead of silver or gold money, and employ it in all buying and selling. In consequence of this measure every Hindu's house became a private mint . . . to the serious detriment of the empire. . . . When such ruin fell everywhere upon commerce, and the copper tokens became viler than bricks, and were of no use whatever, Sultan Mahommed repealed his edict, and issued a new order, though with the fiercest wrath in his heart, that every one who had the copper coin might bring it to the treasury, and exchange it for the old gold money. . . . In such quantities was the copper carried that there were heaps of it in Toghluqabad like mountains, while immense sums passed out from the treasury in exchange for it, and this was one great evil which fell upon the State from this measure. And again, since the Sultan's edict had failed in bringing the scheme to pass, and the copper tokens had only absorbed a large portion of the revenue, the heart of the Sultan became more alienated from his people."

The water-carrier, as mentioned by Mr. Cowell in an article he contributed to the *Journal of the Asiatic Society of Bengal*, who saved Humayun's life at Chousa, and was

rewarded by sitting on the imperial throne for half a day, employed his short tenure of power by providing for his family and friends, and caused his leathern water vessel to be cut up into leathern rupees, and gilt and stamped with his name, and the date of his reign as sovereign prince.

Of Agra and the "peerless cupola" of her Taj Mahal, and the palace of her greatest monarch Akbar, "who" (as his son said), "sounded the great drum of sovereign power for a period of sixty-four years without a rival," we have a picturesque account. This great Mogul is mentioned by Coryat, in 1561, as—

"Akbar Shah, a verie fortunate prince, and pious to his mother, his pietie appearing in this particular, that when his mother was carried once in a Palankeen, betwixt Lahor and Agra, for that he travelling with her, tooke the Palankeen upon his own shoulders, commanding his greatest nobles to do the like, and so carried her over the river from one side to the other, and never denied her anything but this, that shee demanded of him that our Bible might be hanged about an Asse's neck and beaten about the town of Agra, for that the Portugals having taken a ship of theirs at sea, in which was found the Alcoran amongst the Moores, tyed it about the neck of a Dogge, and beat the same dog about the town of Ormuz; but he denyed her request, saying That if it were ill in the Portugals to doe so to the Alcoran, it became not a King to requite ill with ill, for that the contempt of any Religion was the contempt of God; and he would not be revenged upon an innocent Booke."

Pass we by the journey from Simla to Lahore, and the strange history of the Nurjehan, the consort of the Emperor Jehangir, whose tomb, with that of her husband, is four miles from the city. Of this gifted and beautiful woman the Emperor Jehangir says, in his memoirs:—

"In the whole empire there is scarcely a city in which this Princess has not left some lofty structure, some spacious garden, as a splendid monument of her munificence. She was betrothed to Sheer Afkan, but when that chief was killed" [notoriously by the contrivance of the worthy monarch himself] "I sent for the Kanzy and contracted a regular marriage with her, assigning for her dowry seven crore and twenty lacs of rupees (or 7,200,000*l.*), which sum she requested as indispensable for the purchase of jewels, and I granted it without a murmur. I presented her, moreover, with a necklace of forty pearls, which had cost me sixteen lacs of rupees. Of my unreserved confidence this princess is in entire possession, and I may allege, without a fallacy, that the whole fortune of my empire has been consigned to the disposal of this highly endowed family; the father being my dewan, the son my lieutenant-general, and the daughter the inseparable companion of all my cares."

Of Kashmir, its shawl makers, its world-famed Jhelum, its ruined temple of Marttand, its people; its *Chaugan* or Polo, played at night with lighted fire-balls and golden-headed sticks; and of the homeward journey thence by Peshawur, the marble rocks of the Narbudda, and the marvellous monolithic temple of Ellora (familiar by sight and name to the readers of Mr. Fergusson), time forbids our speaking. We can but recommend our readers to get the book and judge its merits for themselves. The volume is a beautiful specimen of typography, and the illustrations, engraved by Mr. Palmer from Mr. Robertson's drawings, "principally from the writer's sketches," are models of their

Calcutta, 447,601; Madras, 397,552. Compare with that of the principal English towns as per latest census: Liverpool, 493,405; Manchester, 351,189; Birmingham, 343,787; Leeds, 259,212; Sheffield, 239,946.

kind. We do not remember to have seen in illustrations to Indian travels any that in the same compass do such justice to the subjects here represented. The portrait of a Chuprassie (p. 36), and view of the curving Jhelum (p. 176) are both admirable in their way.

If, as we trust it will, the book reach a second edition, we would plead for greater accuracy in the statistics quoted, and for a map, and a fuller index, as among desiderata. May we hope that the same skilful heads and hands, of which this volume is the record, will again be employed for our benefit?

E. FRERE.

Life of H. R. H. the Prince Consort. Vol. I. By Theodore Martin. (London: Smith, Elder & Co., 1875.)

MR. MARTIN'S *Life of the Prince Consort* is the latest (we believe) and perhaps the most satisfactory of the numerous monuments which public gratitude and affection have demanded. The biography is not only interesting to contemporary readers, but it will be of the greatest value to remote posterity, who without this work might possibly remain in some doubt as to which of "the world's heroes," as Mr. Martin says, the other monuments commemorate. It was part of the late Prince's remarkable and singular merit, that he did not write his name on the chronicles of his age in large and brilliant characters. His influence was a silent and scarcely noticed one, and Mr. Martin's volumes are almost necessary to enable the English race of the future to understand the retiring and self-denying nature of its benefactor. It is Mr. Matthew Arnold, we think, who has said that men naturally dislike the born saint, who is in the world, and not of it, nor comprehended by it. The Prince Consort was not a saint, but he was misunderstood, and to a certain extent disliked, in the same way as a saint would have been. His character was so rounded, so complete and perfect, he was so absolutely adapted by nature and education to the place he filled, that slander could lay no hold on him, and goodnature could attach itself to no amiable weakness. In all the sad and curious records of royal marriages, it would hardly be possible to find the story of such a life as his. Without becoming a *fainéant* or a cynic, he kept his hand from venturing to touch the alluring insignia of power that lay almost within his reach. As a consolation he may be said to have taken all accomplishments to be his province, and thus managed to make dignified and graceful a life which fell short of being august. It is scarcely in human nature not to sneer at such modest and complete success, and it will scarcely be in our generation that the Prince's victory over unheroic difficulties, and ordinary temptations presented in their highest power, will be appreciated.

The early pages of this biography, "les enfances Albert," have somewhat the air of the most smoothly prosperous and moral of fairy tales. A princess and a prince are born within a few months of each other: the same *accoucheuse*, Mr. Martin tells us, assisted on both interesting occasions. They are beautiful, virtuous, and intended

by nature and by their excellent relations for each other. A benevolent fairy presides over their nurture, the Baron Stockmar. No one could do anything without Stockmar, who was a native of Coburg, and private physician to Prince Leopold. When the youthful pair arrived at the pleasing age of seventeen, the Prince with his father paid the Princess a visit in England. Then Stockmar saw to his bringing up, "with a view to the possibility of his being called to fulfil the duties of a Prince Consort." Surely never was a Prince so clever or so well taught since Prince Giglio carried off all the prizes at the University of Bosforo. Berlin was shunned as at once priggish and profligate, and Bonn was selected, where Fichte had the honour of opening the princely mind. "He distinguished himself by the rapid progress he made, especially in the natural sciences, in political economy, and in philosophy." He also gained the fencing prize, and no doubt the good-conduct prize would have fallen to him, if such a reward had been given at the University of Bonn. "Nor was music forgotten, of which the Prince was always passionately fond, and in which he had already shown considerable gifts as a composer." As we are in the chapter of music, it is impossible to resist quoting a beautiful passage from the pen of Lady Lyttelton. And it may save the fashionable reader trouble, if she will always study the places where Lady Lyttelton is referred to, and carefully skip those in which the name Stockmar occurs, the worthy Baron's letters being mainly about Virtue and that kind of thing. Lady Lyttelton writes, on October 9, 1840:—

"Yesterday evening, as I was sitting here comfortably after the drive, by candle-light, reading M. Guizot, suddenly there arose from the room beneath, oh, such sounds! . . . It was Prince Albert, dear Prince Albert, playing on the organ; and with such master-skill, as it appeared to me, modulating so learnedly, winding through every kind of bass and chord, till he wound up with the most perfect cadence; and then off again, louder and then softer. No tune; and I was too distant to perceive the execution or small touches, so I only heard the harmony; but I never listened with much more pleasure to any music. I ventured at dinner to ask him what I had heard. 'Oh, my organ! A new possession of mine. I am so fond of the organ, it is the first of instruments; the only instrument for expressing one's feelings.' (I thought, are they not *good* feelings that the organ expresses?) 'And it teaches to play, for on the organ a *mistake*! Oh, such misery!' And he quite shuddered at the thought of the *sostenuto* discord."

This admirable extract has made us digress from the Prince's education, which included a tour under Stockmar to Italy. Mentor notices in his pupil a weakness common to the young: he did not care for politics. A less frequent failing with princes was an indifference, and almost dislike, to the society of women. And he was inclined to spare himself trouble. Stockmar arrested all this, and throughout the volume kept on writing didactic letters, very much underlined, pointing out the value of earnestness, and the demerits of frivolity. It is the most curious thing in the story, that these epistles were highly valued, and the whole correspondence leaves an impression of simplicity and goodness of an old-fashioned sort. It

is Télémaque, it is Rasselas Prince of Abyssinia, it is Imlac, and Mentor, all over again in the nineteenth century. And Imlac never bores Rasselas, in this legend, Télémaque never wishes that Mentor would resume the shape of an old owl, and fly away. The end of the fairy tale, the pretty natural conclusion, was at hand: her Britannic Majesty in 1839 found "Albert's beauty most striking, and he is most amiable and unaffected—in short, *delightful*." There were no rivals, no wizards, no cruel giants to slay, only a recalcitrant House of Commons, which was stingy about the royal allowance, and perhaps a dragon or so in the Queen's former German governess, the Baroness Lehzen, who did not like to give up her authority. Of course there was some trouble about precedence, but these things will happen in the best regulated Courts.

For years the story is not a very interesting one—a great many children, a great deal of happiness, music, hunting—the Prince rode well to hounds—planting, the usual amusements of English gentry. Some scoundrelly attempts were made to shoot Her Majesty, and the lash put a stop to the mania. 1843 was a great year: the royal pair visited Louis Philippe, and their voyage was commemorated by Bon Gaultier in a lively ballad. The Emperor of Russia and the King of Prussia came to England, and the Emperor and the King of Saxony were entertained with the spectacle of a review. Lady Lyttelton mentions

"the really beautiful salute of Prince Albert, who rode by at the head of his regiment, and, of course, lowered his sword in full military form to the Queen, with *such* a look and smile as he did it! I never saw so many pretty feelings expressed in a minute!"

The Emperor told Lord Aberdeen he wished the Prince were his son, and he expressed a hope to the Prince that they might meet in battle, on the same side. The Prince very nearly said he trusted they might never see any interruption to the peaceful state of Europe, but he checked himself, "thinking the remark might be taken amiss." All this chapter will be fondly dwelt on by readers who feel how deeply unsatisfying are the usual brief notices that "Her Majesty walked on the slopes."

Times continue to be busy. Osborne is bought—a pleasant residence, where the Woods and Forests cease to trouble. Louis Philippe returns the royal visit, and behaves with much unction. The Prince relinquishes the notion of being King Consort and Commander in Chief; some time afterward the loyal University of Cambridge elects him as her Chancellor. The only obvious appearance of the Prince in the parliamentary affairs of 1847 was his coming to the House to hear a debate, which innocent act was twisted to political uses. The Irish Famine and the Corn Laws are part of the history of the nation, but the Spanish marriages had a personal interest for the Queen and her husband. Louis Philippe had declared at the Château d'Eu, during the royal visit to France, that he would urge the marriage of the Infanta "till the Queen of Spain was married and had children." He kept his promise in the usual fashion of kings, and the letter of his wi

the Queen of England on the subject ally announced the beginning of evils. The correspondence, in which Her Majesty's letters are full of quiet force and dignity, is said to have been in the portfolio which M. r  mieux (*teste* Mr. Stapleton) snatched from Louis Philippe as he fled down the grand stair of his palace and scrambled into his carriage. It is pleasant to learn that Stockmar quite approved of the conduct of our rulers, and went so far as to say, "the Queen and Prince improve greatly."

The Spanish difficulties were only one of the many sources of danger on the Continent on the eve of 1848. The Prince studied foreign politics with industry, and his memoranda for the guidance of our Ministry on the matter of Lord Minto's mission to Rome, and for the guidance of the King of Prussia in the matter of German regeneration, have a curious interest now that Italy is free, and Germany, we suppose, regenerated. Stockmar disapproved of the German memorandum, and it was never sent. The Prince's programme was not very like the course events have taken. Blood and iron were ingredients he did not love, and when one thinks how changed is England's position, and how little likely Mr. Disraeli is to annoy any foreign power by interference, one cannot doubt that the Prince was taken from the evil to come. We close this notice of a book whose main interest is its revelations of Royal home life, with an extract from a letter to her Majesty, from her sister, the Princess of Hohenlohe:—

"I well understand your having been sorry to leave the Highlands. Not only that style of country, but the way of living there was agreeable to you. I know that well from experience, coming home after a time of delightful independence. One feels so shut in on all sides, so tame. By legrees the old habits and occupations overcome that feeling. But there still remains a yearning after what is past, and which seldom comes again just so. That is life! and makes one feel very sad at times. With me it is not the feeling of sadness at the running down of life, year after year, but that everything which gives one pleasure, and is beautiful, should pass away like everything else, leaving only recollection as a mark of having been there. . . . I am becoming very resigned to what gives me pain or pleasure—not that I feel it less, but I am not afraid of things that give me pain; I have become so accustomed to it of late."

"That is life," and an entrance into life again, out of the record of courts, and the ecstasies of ladies in waiting. A. LANG.

SOCIALISM.

Socialism: Founded on the German Work "Kapitalismus und Socialismus." By the Rev. M. Kaufmann, B.A. (London: Henry S. King & Co., 1874.)

To English readers in general Dr. Sch  ffle's name is probably known only as that of a former Minister of Commerce in Austria. His tenure of that office was brief, but he has long ranked high among German economists, and was for some time Professor of Political Economy in the University of Vienna. He has made not a few enemies in Germany, as a politician, by allying himself, though a Protestant and a Liberal, with the

Ultramontane "Catholic-aristocratic party" in Austria; but although his political character is often assailed on this account, his philosophical attainments and ability are undisputed. He has, however, the failing, as an author, of excessive diffuseness, and his justly celebrated work, *Kapitalismus und Socialismus*, is said in Germany to be on that account *mehr gelobt als gelesen*, more praised than read. It grew out of five lectures delivered in the Museum of Industry at Vienna in 1870, subsequently developed and expanded into the fifteen lectures which the work contains; a circumstance which may help to account for some repetition and redundancy which Mr. Kaufmann has done well to prune in his condensed translation. Dr. Sch  ffle has not joined the Eisenach Congress, but the drift of his writing is in harmony with the views and aims of most of the members of that body, and of the *Katheder-Socialisten* (Socialists in the Chair, or Socialistic Professors) of Germany, who (though by no means really communistic in their ideas) are far from content either with the actual economic position of the working classes, or with the old doctrine of *laissez faire*, as a solution of what is called in Germany the social question. The theory of natural law, dominant in the political and social philosophy of the last century, led Quesnay and his followers to assume that if things are only allowed to take their natural course, and individual interest is unfettered, "*le monde alors va de lui-m  me*," the best possible economy of society establishes itself spontaneously, with the greatest amount and the justest distribution of wealth. This assumption lay at the root also of Adam Smith's philosophy; and the free-trade controversy, the convenience which statesmen, economists, and journalists found in a symmetrical theory, together with the optimism of successful capitalists, combined to make it an article of orthodox political economy, and of the creed of the Liberal party both in England and on the Continent. The unsatisfactory condition of the working-classes in all countries has nevertheless led to various Socialistic schemes in opposition to the system of individual competition, and the object of Dr. Sch  ffle's *Kapitalismus und Socialismus* is to examine the arguments and proposals of leading Socialists like Dr. Karl Marx and the late Ferdinand Lassalle on the one hand, and to suggest remedies for the actual evils and imperfections of the existing economy of society on the other hand.

Political economists of the orthodox school, by one of their inaccurate generalisations, furnished the champions of modern Socialism with their principal argument. Labour, they urge—following Ricardo, MacCulloch, and some of their most eminent successors—is the cause of value, the only source of wealth, and the sole productive power; every article in the market represents so much labour and nothing more; capital itself is simply the produce of labour, and may be regarded as accumulated labour. But instead of getting the full value of his labour in wages, Karl Marx and Lassalle contend that the working man gets only the bare necessities of life, the capitalist engrosses the difference, and a few thousand

employers gain enormous fortunes, and live in sumptuous luxury, at the expense of the class who produce everything. Dr. Sch  ffle replies that capitalists at their own risk furnish labour with materials and instruments, and, if they are sometimes inordinate gainers, they are also sometimes heavy losers; they direct labour to the production of commodities for which there is a demand (a thing which the labourers never think of), and they benefit the community at large by reducing the cost of production to a minimum. We have not space for Dr. Sch  ffle's whole argument, but full as it is, it hardly dispels an error, injurious to capitalists and labourers alike, into which Ricardo's principles have led some of our best economists, namely, that profit depends on the cost of labour, and the productive power of labour is the sole cause of profit. Capitalists are accordingly led to look mainly to keeping down wages for profit, and labourers are led, on the other hand, to assume that an increase of profit can be had only at their cost. But the part capitalists perform in production does not consist merely in directing the productive power of labour into profitable channels; they have themselves, and their capital has productive powers. The body and brain of the capitalist, the animals as well as the men he employs, have productive powers, and their machines have longer and stronger arms than their labourers have. A company of capitalists might dispense altogether with hired labour, yet produce largely by means of animals, machinery, chemical processes, and their own exertions and inventions; and a great part of the actual production of every civilised country is due to powers of this kind, other than hired labour. Where labour is hired, its efficiency may remain constant, yet the energy, skill and economy of the capitalist, and an improvement of his instruments, may quadruple the produce. Capital is not simply the produce of past labour, as famous economic text-books agree with Lassalle in asserting. Watt's steam engine was the product mainly of his own genius and toil, aided by the enterprise and capital of his partner Boulton; and he often declared that the great difficulty he had to contend with in its construction was the unskilfulness of the workmen. Machines, moreover, can be made by machinery, and are by no means, as Marx and Lassalle contend, simply "congealed, or accumulated labour." Dr. Sch  ffle quotes a sarcasm of Lassalle on the unfortunate economic term "abstinence." "So then profit is the reward of abstinence! European millionaires are ascetics holding out the plate for the reward of self-abnegation! In their midst, surpassing the rest of the sufferers, stands the house of Rothschild." The answer is, that a negative term by no means adequately represents the part performed by capitalists; and economic terminology, in this as in many other instances, is defective.

The doctrine that labour is the sole source of value and wealth, leads to a curious condemnation of money by Socialists such as Lassalle. Labour, they argue, produces all commodities, and is entitled to receive the full value of its produce; but through the pro-

cess of exchange, and under the cover of the payment of wages, it is defrauded of its due. Money accordingly, as being the medium of exchange, is denounced as the root of all evil. Dr. Schäffle points out that the sum paid in wages sometimes far exceeds the amount subsequently realised by the capitalist, who might, with equal reason, urge that the intervention of money has defrauded him of his profit. Money, he adds, facilitates the sale of the produce of labour in the best markets, and thus raises its value; and it gives the labourer a power of disposing of his earnings how and when he pleases, which he would not have if paid in his own produce or any other commodities.

Another charge brought by Lassalle against the existing industrial economy, and on which he bases an argument for the intervention of the State, relates to the frequent occurrence of disastrous commercial crises. These, he argues, are ruinous to numbers of working men, and are ascribable entirely to the fatal nexus in which commercial affairs are involved by the present system of competition and speculation. Dr. Schäffle replies that occasional miscalculations and disasters vibrating throughout the commercial world are certainly inevitable incidents of a great extension of trade, yet modern speculation surpasses all former methods, and any system of State supervision that could be devised, in estimating the chances, and foreseeing the fluctuations of the markets; indeed, far more violent oscillations of prices, attended frequently with dearth or actual famine, were common in those ages of simple and unspeculative trade which Lassalle lauds.

Much that Dr. Schäffle says on this subject is instructive, but we cannot go the length with him of contending that modern commerce and speculation tend to prevent, instead of occasioning, the convulsions called crises. Tocqueville, riding his theory of democracy as usual rather hard, attributed them to the democratic institutions and spirit of modern times. In democratic countries, like the United States, he said, all classes are engaged in business, and this becomes more and more the case in other countries with the spread of democracy; hence the ramifications of trade become so numerous, extensive, and complicated, that no one can foresee the casualties and embarrassments that may arise, and commercial interests are so interlocked that a slight miscalculation or accident often causes general disaster. Without dragging democracy into the discussion, we think it must be admitted that the development of credit, and the immense ramifications and complexity of commercial transactions, expose modern trade to shocks and collapses unknown in earlier times; and that the intense greed and the reckless speculation of many capitalists really contribute largely to the occurrence of crises under the competitive system, though Socialistic arrangements might end in much greater disasters.

Dr. Schäffle's work is, however, no indiscriminate defence of the existing industrial economy under the hegemony of capital, which he calls "capitalism," a term which Mr. Kaufmann has necessarily adopted for

lack of an English equivalent. "It is," he says,

"an undeniable fact that horrid abuses do exist, which have been laid bare by Socialistic writers, and wholesale frauds are now perpetrated in European capitals compared with which the feudal robberies and theocratic extortions were a mere trifle."

And elsewhere:—

"Capitalism, by its wholesale modes of production, has largely contributed to the total dissolution of family life among the labouring population; it has destroyed all small capital, and has thus rendered the moneyless labourer incompetent to form economical plans, living as he is compelled to do from hand to mouth."

Again, after defending private property against communism—especially on the ground that true economy requires the watchful eye of proprietorship, and the higher the rate of increase in the population, the more wary and careful must be the supervision of interested individuals or corporations—he adds:—

"But our consideration of this subject not only leads to a defence of property where it *does* exist, but also to a condemnation of the wretched condition of the proletariat where it does *not* exist. A distribution of property in which large masses of the people have no share points to a rotten and unnatural state of affairs. Property and personal development are correlative qualities. A man without anything to call his own is no longer an independent individual; he becomes a mere instrument, a tool, a hand."

A perfect economic organisation, according to Dr. Schäffle, can never result from the operation of individual interest alone. The existing economy of society does not rest on that foundation alone, and could not exist for an hour without other bases. The economist of the old school imagined a complete organisation for the production and distribution of wealth in the division of labour and exchange, and a complete economic science in the inferences which he deduced from the hypothesis of an uninterrupted and unimpeded pursuit of wealth by every individual. But, as a matter of fact, production and distribution have never been effected by that process only; the family at one end of the social structure, the State at the other end, and corporate bodies between the two, religious and secular, still play a considerable part. We live in an historical social world, which has developed various organisations, all of which have left traces, and some retain vigorous life. Originally the family was the sole organisation for economic as well as other purposes; and as it was the germ out of which the whole modern social economy has been evolved, so it continues to be at this day an important element in it. The State is not an aggregate of individuals merely, it is an aggregate of families; and the distribution of wealth is largely effected by the family, almost altogether as regards the share of the young. It plays a not unimportant part to this day, even in the production of wealth, in all countries, in the making and mending of clothes and the preparation of food, and in most countries in rural economy and farming. The patriarchal family, again, evolved the village community or township, the fief, the trade brotherhood or guild, the Church and the

State, as well as individuality in all its modern forms, and also the nascent principle of co-operative association. Even the feudal and ecclesiastical organisations still contribute something to the structure of the economic world; the State, though its functions are better defined, is more powerful than at any former period, and Dr. Schäffle devotes an important part of his work to discussing the modes by which the State can contribute to the improvement of the economic condition of the working-classes. Corporations, too, with collective property, are among the institutions which he advocates as essential by the side of private property and competitive capital. As the present social economy was naturally evolved out of earlier forms, so every future form, he urges in opposition to revolutionary Socialistic schemes, must be naturally developed from the present, and he looks with especial hopefulness to a great development of co-operative associations for the means of elevating the condition of the labouring population, and endowing the proletariat with property. But the labourers' question, in his view, is not a question for the economist only, and is not to be solved only by economic principles or arrangements. The solutions must be sought in all the civilising forces of society: science, literature, the press, art, education, and religion must have a share in bringing about a more healthy condition of the poorest classes.

Dr. Schäffle's work is, on the whole, one of great importance, and full of instructive matter, and Mr. Kaufmann deserves credit for furnishing English and American readers, who cannot or will not read the original, with the means of possessing themselves of its substance. Mr. Kaufmann's translation is, we believe, the first attempt of the kind to bridge for the English public the gulf between English and German political economy, which is so seldom crossed by English economists, though German economists rarely fail to make themselves thoroughly conversant with our economic literature. For reasons already given, we think Mr. Kaufmann has acted judiciously in reducing the bulk of the original work in his "condensed translation;" though in two or three cases, especially in relation to the rights of women, it would have been better, in our opinion, to reproduce Dr. Schäffle's views without abridgment. In one or two other cases, on the other hand—for instance, in the discussion of value—Mr. Kaufmann's version might well have been more condensed, and have left out distinctions without a difference, such as that between value in exchange and market value.

There may be two opinions about the plan Mr. Kaufmann has followed of interweaving occasional references to English authors and other matter with the translation of the original, in place of making such additions in separate notes, identified as his own; but his version, as it stands, has Dr. Schäffle's express sanction and approbation, and this fact confirms the assurance given in Mr. Kaufmann's preface, that "the reader of the volume has the sum and substance of Schäffle's views before him." Our own comparison of a considerable part of the volume with the original leads us to corro-

borate that assurance. Mr. Kaufmann is, we presume, himself a German, and his English, though it generally conveys the author's meaning clearly enough, is not always idiomatic or correct, and it ought to be thoroughly revised before another edition. Translating a passage from Lassalle, he renders *Leibeigemen*, "vassals." A sovereign prince might be a vassal: the King of England was the vassal of the King of France; and the humblest vassal in the proper sense of the term was, we apprehend, a freeman at least. But *Der Leibeigene* surely was never a freeman. In the same passage, Mr. Kaufmann translates *lehnspflichtigen Dörfer*, "allodial villages." We should rather say that *lehnspflichtigen* is the antithesis to allodial. It looks, again, rather like a clerical synecdoche on Mr. Kaufmann's part, as a clergyman of the Church of England, to translate as he does, p. 279, Dr. Schaffle's words *die Kirchliche und die freie Religionität*, simply "the Church." Those, however, who best know the difficulty of accurately and idiomatically translating German economics into English will be least disposed to be hypercritical over Mr. Kaufmann's volume; and, for our own part, we do not hesitate to recommend it to all readers interested in the important subjects of which it treats, who do not possess German or leisure enough to read the original.

T. E. CLIFFE LESLIE.

The History of the Peloponnesian War by Thucydides. Translated into English by Richard Crawley, Fellow of Worcester College, Oxford. (London: Longmans & Co., 1874.)

MR. ARNOLD, in his essay on the literary influence of academies, took occasion to contrast the translations of classics turned out for Mr. Bohn's Library with those in M. Nisard's collection. No one, he says, who knows French or German well would look at an English translation of an ancient author whom he could get a French or German one. With all due allowance for Mr. Arnold's anti-patriotic bias, we are forced to admit that at the time the essay was written the statement was in the main true. But, though an English Academy is still to seek, it is marvellous how much has since been done by English scholars to wipe out this reproach. Since Messrs. Church and Brodribb's translation of the *Histories* of Tacitus, few Englishmen will care to consult Burnouf or Louandre; and a Frenchman or German is more likely to turn to Mr. Jowett's Plato, than an Englishman is to Cousin's or Steinhart and Müller's. We may now add with tolerable confidence that there is no French or German Thucydides which can compare either for accuracy or vigour with Mr. Crawley's version.

To say that Mr. Crawley has superseded all his English predecessors is but faint praise. The original version of Hobbes is not altogether unworthy of the author of the *Leviathan*: it is clear and vigorous, but diffuse and full of Grecisms and inaccuracies. Modern versions of Hobbes have removed some of the blunders, but rather marred than mended the style. Bloomfield is a better scholar, but his English is clumsy and often

as obscure as the original. Mr. Dale enjoyed the immense advantage of Arnold's teaching, and it would be unjust to depreciate a work which has lightened the labours of many generations of schoolboys, and which is, after Kennedy's Demosthenes, by far the best of Mr. Bohn's series; but I may add without fear of giving offence, that no one ever succeeded in reading ten consecutive pages of Mr. Dale without the original by his side. The only existing work worthy to compare with Mr. Crawley's is Mr. Wilkins' *Speeches of Thucydides*. Of the respective merits of the two I propose to speak further on.

Paradox as it may seem, it is none the less true that the very difficulty of Thucydides makes the translator's task easier. To preserve in an English dress the native grace and simplicity of such a passage as the introduction to the *Phædrus* or of one of Plato's myths is a task which baffles even the delicate touch of such a master of English as Mr. Jowett. Thucydides presents a wholly different problem. To render the speech of Diodotus or the reflections on the Corcyrean revolt intelligible to an English reader, the translator must to a great extent abandon the attempt to reproduce the peculiarities of Thucydides' style, he must break up sentences, expand, condense, and recast the whole; and if he gives us the sense of the author without addition or omission, we shall pronounce his work a success even though he has sacrificed the form. There is only one living writer capable of conveying to an English reader an adequate notion of the intricacy and obscurity of Thucydides' rhetorical style—the author of *Sordello*. No parallel would seem at first sight less promising than that which I have suggested between the English poet and the Greek historian, but in style at least they present a striking resemblance. There is the same abruptness of transition, the same involved structure of sentence, the same accumulation of parentheses, the same impatience of grammatical constraint. Words are forced to bear new meanings, or diverted from their natural order; pronouns are omitted, or so used "that they may belong to half-a-dozen distinct nouns;" and the language seems often to break under the strain of thought. We might carry the parallel still farther. Thucydides' speeches, like Mr. Browning's, are "semi-dramatic utterances." He conceives his characters clearly, and vividly enters into the situation; but they do not, like Shakspeare's characters, speak for themselves; we never lose sight of the showman, or forget the advocate in his cause.

Most scholars will, I think, allow the general justice of this attempt to characterise Thucydides' style, though the inference I have drawn will, I fear, be regarded by many as heterodox. Mr. Wilkins, for instance, whose criticisms in general are more remarkable for candour than politeness, puts Mr. Crawley's translation out of court as "a truant though spirited paraphrase."*

* It is only fair to Mr. Wilkins to state that this was written when only the first book of Mr. Crawley's translation had appeared, and I have no doubt that Mr. Wilkins would modify his judgment on perusing the whole.

As regards the narrative portion, that is to say, three-fourths of the whole work, this censure is wholly unmerited. In this Mr. Crawley is as faithful as is consistent with idiomatic English, and his style seems to me admirably to reproduce the distinctive qualities of his author: it is vigorous, laud, dignified and unaffected. As regards the rhetorical portions, I have attempted to show that a literal rendering is likely to appear to the lay reader (to borrow Cowley's phrase) as though one madman were translating another. But if the word *paraphrase* is used in *malam partem* to connote a shirking of difficulties, I can fully endorse the statement in Mr. Crawley's original preface, that he has never leapt over the limits of a translation to expatiate in the freedom of paraphrase. If any further justification were needed, I may add that wherever I have compared the two versions, Mr. Crawley's appears to me quite as close as Mr. Wilkins'. The latter, it is true, is the better Greek scholar, he is more careful in rendering particles; like Browning's grammarian, he "gives us the doctrine of the enclitic *de*, dead to the waist down;" though he often thereby sacrifices brevity and terseness; he makes more points, and in an examination I have no doubt would bear off the prize. Mr. Crawley, on the other hand, is plainer and simpler; his sentences have, to my ear, a more thoroughly English ring; his literary taste and common sense often carry him safely over difficulties which mere scholarship would fail to solve, and consequently his version will be preferred by the ordinary reader or the historical student. I had intended to enable the reader to test the justice of my judgment by citing and criticising one or two passages of the rival versions. Space, however, forbids me to quote even from Mr. Crawley, and I must be content to call attention to the Character of Themistocles, the Funeral Speech of Pericles, the Corcyrean Revolt, and the beginning of the Sicilian Expedition as favourable instances of his style. Mr. Crawley rises with his author, and, as a rule, where Thucydides is at his best, his translator is also at his best.

In conclusion, I would offer one or two criticisms in detail, and point out some few oversights and omissions.

To begin with mistakes. In ii. 62, 1, a comparison of ii. 45 (*ἀρετῆς περὶ ἡ πόλιν*) and iii. 3 (*τῶν τευχῶν καὶ λιμένων περὶ*) seems to prove that the words *μεγίστους περὶ* are parenthetical. Read: "The full extent of which you never realised."

In iii. 43, *μόνην τε πόλιν . . . εὖ ποιῆσαι ἀδύνατον* is rendered, "The city and the city alone . . . can never be served." Read: "Athens is the only city," &c.

In iii. 47, *τοῖς ἀποστρατοῖς* is mistaken for *τοῖς ἀποστάταις*, and rendered "the insurgents."

In vii. 40, the two distinct operations of sailing alongside the triremes and running in between the oars and the triremes are mixed up together and made one.

In vii. 48, *καταγγέλλουσι γίγνεσθαι* is translated "exposed to the jeers of" instead of "betray themselves to."

In vii. 61, the not unusual idiom, *καὶ τῶν ἄλλων συμμάχων*—"and the allies besides," is not seen.

In viii. 46, the difference of *ἐλευθεροῦν* and *ἐλευθερώσαι* is neglected. See Shilleto's edition of *De Falsa Leg.* 443.

In ii. 54 a short sentence is omitted.

Even in Mr. Crawley's translation a few Greek idioms still intrude, though rarely. *E.g.*, in i. 6, "a tie of golden grasshoppers;" on p. 130, "the body was broken out into ulcers;" on p. 136, "any individual well;" and in viii. 68, "he yet of any one man was best able" (*πλεῖστα εἰς ἀνὴρ*).

In one respect this translation is, I imagine, unique. It has not a note from beginning to end. To "the English men and women who, without being Greek scholars, take an interest in Grecian history," for whom Mr. Crawley writes, this may doubtless be a boon; but to the critic it is, to say the least, very tantalising. It is often impossible to tell what reading Mr. Crawley adopts. Thus, in iii. 40, 6, I have no doubt that the right meaning is given, but I do not believe that it can be got out of the text without adopting Donaldson's emendation, *ἐπεξέρχονται καὶ διολλύντες*. In vi. 54, he has, I imagine, adopted (needlessly, I think), Poppo's correction, *οἱ τυράννοι οὗτοι*. In iv. 117, 2, Mr. Crawley has made sense of a passage that has baffled most of the commentators. Here it is evident that he reads *τοὺς δ' ἐκ τοῦ ἴσου* with D. E., and I suppose he adopts Corais' emendation *καὶ μὴ κρατῆσειν*, but this is only guesswork. In another edition I hope he will add a few maps and plans for ordinary readers, and an appendix discussing readings and interpretations for the benefit of scholars.

But enough of fault-finding. I would wish to end as I began with unmixed praise, and will quote one or two particularly happy renderings—single bricks, I allow, and no fair sample of the work as a whole:—

i. 41. *καὶ ὅστις μὴ τοῖς δεξιμένοις, εἰ σωφρονουῖσι κ.τ.λ.* "And will not bring the power who is mad enough to receive them war instead of peace."

ii. 60. *φιλόπολις τε καὶ χρημάτων κρείσσων*. "Not only a patriot but an honest one."

ii. 63. *καὶ μὴ φεύγειν κ.τ.λ.* "And you cannot decline the burdens of empire and still expect to share its honours."

ii. 64. *πάντα γὰρ πίπτει καὶ ἐλασσοῦσθαι*. "If even now in obedience to the general law of decay," &c.

Mr. Crawley has in most instances wisely abandoned the attempt to preserve Thucydides' *παρονομασίαι*. One happy exception is that of *ἀφροσύνη, καταφρόνησις*, i. 122: "A feeling which from the numbers it has ruined has come to be called, not contemptuous but contemptible." So too the *λιμός*, *λοιμός* of the oracle (ii. 54) is well given by "dearth and death."

Last, but not least, of Mr. Crawley's merits is a full and well-arranged index.

F. STORR.

THE *Monde Russe* states that a small party of physicians and naturalists at St. Petersburg propose to undertake a series of excursions into the interior of Russia for the purpose of collecting information on the popular medicines used in different parts of the country, the sorcerers and performers of marvellous cures in vogue among the peasantry, and the drugs they employ. The results of the enquiry will be published in parts.

NEW NOVELS.

Malcolm. By George MacDonald. (London: H. S. King & Co., 1875.)

Theresa. By Georgiana M. Craik. (London: Daldy, Isbister & Co., 1875.)

The Gosau Smithy, &c. By Mrs. Parr. (London: Daldy, Isbister & Co., 1875.)

My Story. By Katharine S. Macquoid. (London: Hurst & Blackett, 1875.)

THERE are, we believe, many generally competent persons who think—indeed it may be said to be almost an accepted opinion—that novel writing is out of the pale of genuine literary style. This opinion might be held with as little liability to challenge as many other opinions, if it did not exercise a very injurious influence on the class of works with which it deals. When a piece of ground is regarded as belonging to nobody in particular, it generally serves as a receptacle of various kinds of useless, not to say offensive, rubbish; and when a certain class of writing is looked upon as having no certain titles of possession and usage, it is in a somewhat similar predicament. Not only is the lower kind of novelist allowed to commit his nuisance or shoot his rubbish without hindrance, almost without protest, but even the higher kind is allowed to pursue his calling without regulation and without supervision, without indeed any proof shown that he has the least idea as to what that calling should be. There are, no doubt, many legitimate kinds of novel-writing. The construction of an ingenious plot, the display of what Mr. Pater calls an "engaging personality," the illustration of noteworthy scenery or manners, the embodiment and framing of brilliant dialogue, are all proper and allowable objects, though perhaps the more excellent way is to unite them. But it is hardly possible to enlarge the list, and no conceivable enlargement would take in what Mr. George MacDonald tells us is his object, namely, "dealing with principles." No more glaring instance of the utter lawlessness which prevails in England in the matter of novels could be found. Here is a craftsman of great experience and many years' standing, who has produced much work which must be called partially good, and none which can be called wholly bad. And this practised workman informs us, openly, and in all simplicity, that he has not the faintest notion of what his proper sphere of operation really is, and that if he has an idea on the subject, it is that the function of a sculptor's chisel is to cut larch-poles for cattle-fencing. It is certainly a very safe assertion that no good novel as such ever yet dealt or ever will deal intentionally with principles, and that any goodness which may be found in a novel so planned is in spite, not in consequence, of its planning.

Malcolm is very much what might be expected from its author and his "principles," although, by the way, it is not very clear what these principles are. There is a great deal of very attractive local colouring, and perhaps a little too much local dialect. There is a delightful Highland piper, who is so very pleasing that it is rather hard to quarrel with the book that contains him. He has a dream in which the ghost of his especial *bête noire* Campbell of Glenlyon appears to him,

and this ghost is very nice indeed. His remark (in reply to a harsh question as to his state) that he is "not tamed very much yet" is perhaps the politest blending of actual truth with a feeling for the wishes of one's interlocutor which could be devised. But the piper's supposed grandson, the eponymous hero of the book, is not nearly up to the level of his grandfather or his grandfather's ghostly enemy. He is one of those dreadfully moral, wise, and secretly well-born young persons in whom Mr. MacDonald delights, and he talks "consumedly." About one-third, if not half, of these three volumes must consist of his utterances. Of course he is heir to all sorts of things, of course he has an angelic friend who is a parish schoolmaster, and of course he falls in love with his own sister quite innocently and unwittingly. We have noticed of late that the moral British novelist, who cannot away with the elective affinities and *besoin d'aimer* of his continental brethren, is particularly fond of this situation, though, to do him justice, he does not usually carry it to the length of the *Bonny Hynd*. But, as Mr. MacDonald tells us, in his last sentence, that his hero's career "requires another book," it may be unfair to criticise this one solely on its own showing. It may be sufficient to say (as, indeed, we have already implied) that it combines great excellences of detail with considerable faults as a whole.

Theresa is rather a negative book both as to merits and defects. It aims at very little, and that little is strictly within the legitimate scope of the novelist; nor in the carrying out of its aim is there any material fault of taste or writing. There is a young lady who, like the servant girl in the advertisement, is "very much in want of some one to love;" there is a gentleman (not young) who supplies that want in a manner, and in the background there is the gentleman's obnoxious wife who prevents the want from being satisfactorily supplied. This fable is carried out in a volume of 250 pages in the orthodox *Love and Duty* manner, and there is consequently nothing to which the most fastidious can object. But perhaps we may be permitted to borrow a Browningism, and to tell Miss Craik "how it strikes a contemporary." It strikes this contemporary, that a young lady who discovers herself to have formed a passion for another woman's husband has two courses before her which, according to different views of morality, may be respectively defensible. She may echo, if she pleases, the exclamation of Mr. Pope's *Eloisa*, may set the world at defiance, and may try what effect the risking of "all for love" may have. Or she may recognise the commission of an unintentional sin, and may do her best to atone for it by breaking off all intercourse with the (as she thinks) wrongfully beloved object. Between these two courses it is not the business of the non-moral critic to decide. But there is certainly no allowable third course, and if she try to serve both Our Ladies of Sorrow by a sort of Platonic hankering which has courage neither to satisfy nor to abjure itself, we fear that the attempt is likely to have the usual success of such attempts at divided allegiance.

In noticing Mrs. Parr's book, there is no

danger of being betrayed into any serious disquisition. The two volumes contain seven stories of the flimsiest and most ordinary magazine type; indeed, with the exception of "Sylvia" (which is fair, and almost good), they fall considerably short even of the very moderate excellence usually attained by such work. Almost the only thing about them which deserves much notice is the gusto with which the writer depicts and reports conduct and speeches of the most atrocious vulgarity. Two of the stories deal with foreign life, and may interest those who think that a bore ceases to be a bore if he or she dwell in a *châlet* or be shod in *sabots*. But "Sylvia," already mentioned, is a pleasant enough trifle, illustrating the "angel unawares" theory, and the heroine is neither vulgar nor mawkish. Mrs. Parr's notions on some subjects are peculiar. It is not surprising that one of her heroes, when at Oxford, failed to become "senior wrangler," but his uncle was certainly unreasonable to expect it. Executors, moreover, are different things from guardians, and there is a mysterious allusion to a "codicil" on which the last story turns, and which leads us to think that Mrs. Parr is in need of some of those useful directions "How to make a Will," which are to be found in most diaries and household manuals.

There can be little question that *My Story* is the best novel which Mrs. Macquoid has yet written, and this is of itself in these days a cheering and unusual fact. There is a good deal of originality about the *donnée*, as well as a fairly fresh mode of treatment, though there are perhaps unavoidable resemblances to Miss Broughton's heroines in the manner of the reciter and central figure, Gertrude Stewart, who is a mild and moral Nelly l'Estrange, with plenty of differences. The writer has wrought in her apparently inevitable Norman scenery not too obtrusively, and the whole effect is certainly good. But we suspect that the interest is kept up in spite of, not according to, Mrs. Macquoid's intention. The story turns entirely on one point. The heroine, a passenger on board a merchant ship, is forced by the wishes of her invalid and moribund mother into a marriage with the captain. In her terror she hardly knows what she is about, but as soon as she comes to herself she sees what no one else has common sense to see, that the mock ceremony into which she has been trepanned cannot possibly be a marriage at all. The glaring improbability of the situation is a great blot on the book. Granting that a "thick-skulled sailor" (as Captain Brand very properly calls himself when he at last comes to the right understanding of his illegal, not to say criminal, conduct) might be ignorant on this point, what could have possessed the clergyman who performed the function, or the doctor who witnessed it? The rest of the book contains an account of the persecutions which the unfortunate child undergoes to make her acknowledge the marriage. It is true that all these persecutions are of the kindly form, and "meant for her good," but persecution of this kind is neither the least tyrannical nor the least galling. One really manages to get up a sufficient amount of sympathy for the heroine,

and of indignation at her idiotic friends, to make one feel decidedly disappointed at the highly proper and correct ending. But the interest is so entirely concentrated in Gertrude herself that the book sometimes drags a little, and one feels inclined to wish that it were in two volumes instead of three. Very much of the third volume could well be spared, and the Tracey family would be better away, satire not being at all Mrs. Macquoid's forte. But we make these remarks mainly because the book is good enough to deserve serious censure. It stands in very marked contrast to the ordinary run of novels.

GEORGE SAINTSBURY.

MINOR POETRY.

Stones from the Quarry; or, Moods of Mind. By Henry Browne. (Provost & Co.) "Scorn not the Sonnet," Wordsworth said, and Mr. Browne has laid the injunction to heart, for in this volume, besides other verses, there are no fewer than 1,000 Sonnets, on every conceivable subject from perambulators to "the tragic buskin." They are not without an interest, though scarcely a poetical one, as in some sort the sincere autobiography of a scholarly and garrulous man who has succeeded in attaining the extraordinary habit, that Hayley among others possessed, of jotting down every passing thought in a neat enclosure of fourteen lines. If a reader were found patient enough to go carefully through the 1000 and select, let us say, fifty of the very best, a thin volume of verse considerably above the average would be the result. Unfortunately, the chaff is vastly predominant, and one really mourns over the suicidal profuseness of a versifier who can write, when he takes pains, lines so good as these addressed to Sappho:—

"Large-hearted Woman! with the articulate
And perfumed breath of thy most passionate song,
Thou didst a flame of Love so pure create,
Didst fan it up so high, blow it so strong.
That the mere reflex warms the world thus late,
With afterglow so lingering and so long!"

But Mr. Browne's radical want of originality is too plainly shown for us to have any hope of his success as a poet.

Sacred Lyrics. By Henry Lockwood. (Kerby & Endean.) One of the flattest and most unprofitable collections of paraphrases from Scripture that we ever remember to have been offended by. Tate and Brady are brilliant in comparison.

Helen and other Poems. By Hubert Curtis. (S. Tinsley.) Without doubt, Mr. Curtis is extremely young. We congratulate him on this circumstance, and hope that advancing years may open bright prospects before him. He will not be a poet, however, we are afraid. Where there is any individuality at all in these verses, it consists in a close imitation of Tennyson's tamer manner, and the effect is very depressing. The fair sex appears to have treated Mr. Curtis with some ignominy, for we find among his poems some "Verses to a Lady that informed the author that she could buy a better valentine than he could write," and some stanzas "to a Lady who threw the author's handkerchief in the water because he would not comply with her wishes." Mr. Curtis must be of a most forgiving disposition, for he tells the latter lady that though he liked her much before, he now admires her even more.

The Trojan Queen's Revenge. By A. H. Beesley, M.A. (Longmans, Green & Co.) Mr. Beesley, taking a hint from the construction of *Balaustion's Adventure*, has framed his translation of the *Hecuba* of Euripides in a setting of original verse. He imagines that Philopolis, an Athenian, reads to the children of his Roman patron a Greek play, and this play is the *Hecuba*, which is given

line by line, in translation. The little introductory speech of the Athenian is delicate and picturesque, and too short rather than too long. We are soon hurried into the tragedy itself, and when any passage seems to require special attention, the reciter pauses, and in words of his own dwells on the delicacy or force of the position. Were not the treatment so irresistibly suggestive of Mr. Browning's marvellous poem, there would be more definite praiseworthiness in this scholarly effort to popularise a poet, for whom Mr. Beesley, in words closely paralleling his predecessor, apologises thus:—

"The rich and wailing music of the chords
Bespeaks, sirs, think ye not, a master's hand,
Whose sweet low minor note shall fill the world
And echo through the ages?"

The thoral passages are very elegantly rendered.

The Emigrant's Story, and other Poems. By J. T. Trowbridge. (Boston: James Osgood.) It is difficult to say where the charm of *The Emigrant's Story*, an idyllic poem in hexameters, lies: it is not in the polish of the verse, for that is sadly rough, nor in the originality of the design, for that recalls a string of American poets from Longfellow to Bret Harte, but it must be in the picturesqueness and masculine force of the narrative, which obliges one to read to the end, and to enter with interest into the story. The same qualities of brightness and manliness characterise the other poems, and the book is disfigured by no straining after what is called culture, or affectation of learning, but is simple, straightforward and local. From some very sunny and healthy lines called "Trouting," we quote a sample verse:—

"High overhead the morning shines;
The glad breeze swings in the singing pines;
Somewhere aloft in the boughs is heard
The fine note of the Phoebe-bird;
In the alders dank with noonday dew
A restless cat-bird darts and mews."

It is far better to write thus, than to maunder about the heathen gods and make false quantities in the act.

Goethe's "Hermann und Dorothea," with corresponding English Hexameters on opposite pages. For the use of Students. By F. B. Watkins, M.A. (Williams & Norgate.) This book is an experiment of the same nature as Professor Robinson Ellis's wonderful version of Catullus, though, of course, less ambitious. The author frankly says in the preface that he has no wish to be poetical, his only aim has been to be literal, and if literality is admirable, he has certainly succeeded to the uttermost. He has taken the licence of coining such words as *years-day* and *back-turn*, and makes free use of them. We do not deny that his version may be useful to schoolboys as a key, but we confess that we find Professor Watkins's hexameters as ludicrously inapt for poetical expression as Webb's sapphics or Sir Philip Sidney's asclepiads. For instance: "And there collected himself the excellent youngster and cried out" is an exact rendering of the original, except than *Jüngling* really is not at all the same as "youngster," but it is no more English than it is German, or rather less, and we cannot think that the clumsy versification is any advantage to the learner.

Hymns translated from the Parisian Breviary. By the Author of "The Cathedral." (London: James Parker & Co.) Mr. Isaac Williams's Hymns are reprinted with the original Preface of 1830, which serves as a sort of landmark to show the almost forgotten revolution that has taken place since it was thought that good churchmanship forbade the use of "unauthorised" hymns, i.e., practically, of any. A very few of these pieces have had the fate their author deprecated, and got into popular congregational use; more might have done so, but that he, in ill-advised imitation (sometimes at least conscious) of the *Christian Year*, wrote in varied metres, which at

best would not adapt to manageable hymn tunes, and which he was himself often quite incompetent to manage. The tiny volume is, perhaps, most important as a reminder that thirty-five years ago, as now, it was possible to be scholarly without being critical, and to possess poetical feeling without poetical power; but then it is a symptom of progress that minds of that order attain less relative eminence now than then.

France Discrowned, and other Poems. By Emilia Blake. (Chapman & Hall.) May be commended to readers who enjoy the fashionable intelligence of the *Morning Post*, and to no others.

On the North Wind, Thistledown. By the Hon. Mrs. Willoughby. (H. S. King & Co.) The best part of this volume is decidedly the cover, and the next best the old-fashioned Scotch ballads. Next come the miscellaneous poems, which have a good deal of warmth and colour, and thought enough if it were only articulate. Worst of all are the metrical tales, which remind one alternately of Tennyson, and Browning, and Clough—or rather suggest that these are among the poets who have stirred the author up into expressing her feelings in incoherent narratives of improbable incidents, described in shambling verse which is really undeveloped prose.

Poems. By Augustus Taylor. (H. S. King & Co.) This is decidedly pleasanter reading than most volumes of minor verse. The writer is strongly moved by death, especially the death of children: he seems to have found his models or his inspiration in the part of Tennyson's work that centres round "In Memoriam," and the part of Wordsworth's work that centres round the "Sonnets." His blank verse is, perhaps, more independent, and certainly less valuable: it is pervaded by a shy religious fancifulness that stops short of imagination. The following is, perhaps, the best thing in the book, and seems really good: it is headed "A Disappointment:—"

"There is more glory in the air,
More vastness in the sky,
The distance spreads more far and fair
Than ever to my eye.
I stand as quiet as a stone,
I dare not speak or move,
I feel mysteriously alone,
My heart is full of love.
I tremble lest a breath should break
The sleep of flower and tree,
My spirit only seems awake
Mid Nature's reverie.
Oh! hour of rare unhop'd-for grace,
I scarce believe it true,
The veil is passing from her face
All in my happy view.
Would she but let her mantle fall,
And leave her beauty bare,
And show the mystery of all
In earth, and sea, and air.
One awful moment would disclose
The secret which distils
Enchantment on the opening rose
And on the purple hills!
'Tis gone! yon pattering leaf has broke
The magic of the spell,
Some watchful Dryad shook the oak,
And startled all the dell!
The clouds sail on, the breeze blows free,
The earth is bright and glad,
The sunbeams flash from tree to tree,
And leave me dark and sad."

EDITOR.

NOTES AND NEWS.

SOME valuable manuscripts relating to the Cornish language have been recently purchased by the Trustees of the British Museum. They were chiefly the work of the late Rev. John Bannister, and consist of a *Gerlever Cernonak*, or vocabulary, a glossary of Cornish names, some

miscellaneous collections relating to the language, and an interleaved copy of Johnson's English Dictionary with MS. notes of Cornish equivalents of words.

THE Rev. Mackenzie E. C. Walcott has recently presented to the British Museum three volumes of manuscript collections illustrating the history of Conventual and Church Architecture in England; also other volumes containing collections for Monastic and Cathedral History, brief memoirs of the Archbishops and Bishops of England and Wales, notes from Cathedral Statutes; and some largely annotated copies of his published volumes on William of Wykeham and his Colleges, the Cathedrals of the United Kingdom, the Ministers and Abbey Ruins, &c., &c.

THE volumes announced by Messrs. S. Bagster and Sons, under the title of "Archaic Classics," are far advanced, and will, it is hoped, be ready by February next, when the Assyrian and Egyptian classes set on foot by the members of the Society of Biblical Archaeology will begin their meetings. The *Assyrian Elementary Grammar and Reading Book*, by the Rev. A. H. Sayce, M.A., will contain the most complete syllabary yet extant, and will serve also as a Vocabulary of both Accadian and Assyrian. The *Elementary Manual of the Egyptian Language*, by Mr. P. Le Page Renouf, F.R.S.L., will contain a carefully prepared introduction to the Hieroglyphic Vocabulary, and a series of interlineary examples. The two special features which these Grammars will possess above all others in English are, first, that the syllabaries are in both cases revised to the present time; and second, that the verbs and nouns are accompanied with the original characters as well as being transliterated, an advantage which every Oriental student will know well how to appreciate.

IN A MS. entitled *Synodalia* [numbered cxxi.] in Corpus Christi College Library, Cambridge, are certain articles, proposed to Convocation, but not passed, for Church government. The last one refers to fines to be inflicted on parents whose children could not say the Catechism; and the last paragraph thereof runs thus:—"Item, That it may be lawful for such Welsh or Cornish children as can speake no English, to learne the Premises in the Welsh tongue or Cornish language." The date is circ. 1580, and our extract is taken from a copy in Egerton MS. 2350, in the British Museum. It seems to show that the Cornish language was more used than one would have thought at the time referred to.

THE Italian Oriental Society will hold its first public meeting in January, 1875. Michele Amari, the great Arabic scholar, will deliver the inaugural address.

SEVERAL Italian papers have expressed their indignation at the Government not sending representatives to the late International Congress of Orientalists in London. Signor Nerucci published a letter from Professor Max Müller in the *Nazione*, in which he impressed on the Government the necessity of taking immediate steps for sending some of the most eminent Italian Orientalists to London, more particularly as there was an idea of holding the next Congress at Rome. The Government thereupon requested Professor Ascoli and another scholar to proceed to London, but it was too late, and Italy, which has done so much for a revival of Oriental scholarship, was almost the only country not represented at the Oriental Congress.

THE Scotch papers announce the death of Colonel Guthrie, of Scotsclader, whose valuable collection of objects of natural history and of Indian coins, brought together during his travels in India, Persia, &c., is well known, and was lately, it is reported, the subject of negotiations on the part of the Trustees of the British Museum.

THE German Agricultural Congress lately undertook an *enquête* into the condition of agricultural

labourers in Germany, the preparation of the report of which has been entrusted to Freiherr von der Goltz, of Königsberg. The subject has been recently discussed in several articles by Professor Nasse, of Bonn, and Freiherr von der Goltz in the *Berlin Concordia*. In the first, Professor Nasse supported the conclusions of Mr. Cliffe Leslie's essay in the *Fortnightly Review*, and reproached the abstract method of reasoning generally from abstract assumptions respecting wages which are affected by different conditions and causes, some of them historical, in different localities. In two later articles Von der Goltz gives from the statistics collected by the *enquête* the rates of agricultural wages in seventy-four different parts of Germany. They vary from 23 Sgr. 8 Pf. at Bremen to 7 Sgr. at Oppeln. He specifies various causes producing these variations—soil, climate, means of communication, vicinity to manufactures, prices, customs of living, great and small estates playing their part, and sometimes working in opposite directions. Thus, he says that great entailed estates tend to raise agricultural wages; but, on the other hand, peasant properties are most numerous in the neighbourhood of manufactures where wages are highest. He does not explain the statement respecting the effect of great estates, but from a former work of his it would seem that it is by causing a great emigration.

ON December 30, Dr. Friedrich Steger, well known as a journalist, critic, and *littérateur*, died at Leipzig, at the age of sixty-four. He was best known to the public as the editor of *Europa*, and the author of papers, collected under the title of "Unsere Tage," but his merits were far greater than those of an ordinary contributor to popular journalistic literature.

ON December 29, as we learn from the Spanish correspondent of the *Allgemeine Zeitung*, the literati of Valencia celebrated the fourth centenary of the introduction of printing into Spain. The civic authorities of Valencia have, according to this authority, paid a tribute of respect to the memory of the earliest printers of their native city by causing a memorial tablet to be inserted into the wall of the house No. 15 of the Calle del Portal de Valldigna, in which, according to the most trustworthy sources, the first book ever printed in the Iberian Peninsula was carried through the press. The mural tablet, which is of white marble, bears the following inscription: "A los introductores del arte civilizador de la imprenta, Alfonso Fernandez de Cordoba y Lamberto Palmart, que en este sitio colocaron la primera prensa que funcionó en España, el Municipio de Valencia al celebrarse el Cuarto Siglo de su Instalacion en este pais. Anno MDCCCLXXIV."

The first book printed at this press bears the title *Trobes en cahor de la Verge Maria* (En Valencia, 1474). It is a quarto consisting of sixty-six pages, and treats of the virtues of the Virgin in forty-eight sections, of which forty-one are in Valencian, three in Castilian, and one in the Tuscan idiom, all having been taken from the writings of forty different poets.

DR. S. WELLS WILLIAMS, a well-known Chinese scholar, has recently published a Syllabic Dictionary of the Chinese Language, arranged according to the Wu-fang-yuen-yin, with the pronunciation of the characters as heard in Peking, Canton, Amoy, and Shanghai. The work has been printed at the American Presbyterian Mission Press at Shanghai, and is comprised in one volume of about 1,200 pages.

AT the recent Winckelmann Commemoration held at Bonn, when numerous papers on archaeological subjects were read, Professor Hugo Garthe, of Cologne, laid before the meeting a hitherto unknown denarius of Charlemagne, bearing the unique inscription of "Deo Veri." Dr. Garthe pointed out that its peculiarity consisted in the fact that, while all other Carolingian coins bear the name of the Emperor on the obverse, and only

that of the place at which it had been struck on the reverse, this one appears to be intended to convey some religious meaning; and he is of opinion that it was designed to be circulated in some region—as Northern or Saxon Germany, for instance—in which the God of Truth was not universally acknowledged, and where the Emperor designed to impress the people with the assurance of his determination to establish the religion of Christ. In accordance with this view, it would probably have been struck to commemorate the subjection of some of those Saxon leaders, as Albion and Wittekind, who so long maintained a successful opposition to the power of Charlemagne, and the introduction into their lands of the new faith.

M. CAMILLE DE LA BERGE has succeeded M. Charles Morel as one of the editors of the *Revue Critique*. We are glad to see from the last number that the position of that valuable journal has never been so well assured as at present. It now has four hundred subscribers.

THE death is announced of M. Pierre Larousse, well known by his educational works, and by the *Grand Dictionnaire Universel du XIX^e Siècle*, to which his name was attached.

SOME months since M. Fontaine, the well-known bookseller in the Passage des Panoramas, purchased of M. Moreau-Chaslon several works, among which were a manuscript relating to the History of France, with the arms of Philippe-Egalité, and the works of Racine, with those of the Comte du Barry, brother of the Countess. He paid 700 francs for the first, and 500 for the second work. He now brings an action against M. Moreau-Chaslon, alleging that he warranted the origin of the works in question, and that by a verification made by M. Charavay, an expert in autographs, it would appear that the manuscript is not that of Philippe-Egalité, and that the Racine probably never belonged to the Comte du Barry, as his arms are affixed upon a false back, skilfully glued upon the original cover. In support of his demand, M. Fontaine shows that M. Moreau-Chaslon sold the Racine to M. Caen, a bookseller, for 1,300 francs, who, when in possession of the book, discovered the forgery and returned it to the seller. The book was then sold to M. Fontaine, it being at the same time made known to him why it had been returned by M. Caen. M. Fontaine then resold it to M. Portalis, who required his money to be returned on discovering the falsification of the binding, and M. Fontaine refunded the money. The forgery of the binding has been so skilfully done, that it is impossible to discover it without the closest examination.

With respect to the manuscript of Philippe-Egalité, M. Moreau-Chaslon offered it to M. Fontaine, stating that the volume had been applied for for the Duc d'Angoulême, but that for private and political reasons he had refused to sell it to him. M. Fontaine, having made the purchase, found that neither the cyphers nor the manuscript were applicable to the Duke of Orleans, and that the binding did not bear his arms. On his side, M. Moreau-Chaslon maintained that he never warranted the authenticity of the books to M. Fontaine. The tribunal decided in his favour, and declared the sale of the books to M. Fontaine to be valid.

THE following Parliamentary Papers have lately been published:—Reports on the Vienna Universal Exhibition of 1873, Part II. (price 7s. 6d.); Part III. (price 6s. 3d.); Part IV. (price 3s. 10d.); the Eighth Annual Report on the Proceedings and Business of Standard Weights and Measures Department of the Board of Trade (price 1s. 4d.); Commercial Reports of Her Majesty's Consuls, Part IV. (price 2s. 9d.); Returns furnished by Industrial and Provident Societies to the Registrar of Friendly Societies in England during 1873 (price 11d.); Census of Ireland 1871, Returns relating to County of Galway (price 2s.).

WE have received *The Life and Correspondence of Richard Whately, D.D.*, new edition (Longmans); Nichols' *Forty Years of American Life*, second edition (Longmans); Spender's *Therapeutic Means for the Relief of Pain* (Macmillan); Heard's *The Tripartite Nature of Man*, fourth edition (Edinburgh: T. & T. Clark); Gross's *Algebra*, part 2 (Rivingtons); Holmes' *The Book of the Goat* ("Bazaar" Office); Sarpoli's *The Spiritual Combat*, new translation (Rivingtons); Roget, Baron de Belloguet's *Ethnogenie gauloise*, part 2, second edition (Paris: Maisonneuve).

In the *Cornhill* Miss Thackeray (?) begins a novel on Angelica Kaufmann under the title of Miss Angel: we are not tantalised as to the name of the heroine, but we are as to those of her patrons. The "Love and Marriage of Catherine de Bourbon" would have been more adequate if it had been clear to the writer that Catherine was as silly as her brother was faithless and heartless. J. A. S. has a suggestive little paper on religious revivals in Italy, a little vitiated by the assumption that the mobility of the Italian nature is due to the want of depth rather than to the absence of complexity.

In *Macmillan* we are reminded of the same subject by a paper on Savonarola as a politician, one of the most interesting numbers of the series on the Convent of San Marco. T. E. Kebbel writes with not quite unfounded severity of a tendency in "Recent Latin Verse" to pursue too exclusively in translating into Latin the excellences which seem most appropriate in translating into English, with the result that the translator who performs *tours de force* in pursuit of happy equivalents for English phrases produces something which, as Mr. Kebbel says, no Roman could have written, and hardly any Englishman can construe. The "Sprightly Ballad of Minikeena" has a purely psychological interest for readers who wish to investigate the precise boundaries of the amusing, the odd, and the silly. J. S. D. and the Editor must both have thought it amusing. A. G. Stapleton's second article on the "Greville Memoirs" contains two comparatively new anecdotes on Louis Philippe.

In the *Gentleman's Magazine*, Justin MacCarthy begins a story in which we are pleasantly introduced to an ingenuous youth, settled in London after being brought up in San Francisco and Japan, to a fairy godmother, and a young hair-dresser and volunteer with his head turned by Huxley and democracy. There is a good deal of gossip about the late Tom Hood, and the *E. s. d.* of literature, and a poem about Heine by Robert Buchanan, who thinks it fanciful to describe Heine as a gnome.

In *Temple Bar* some one thinks it worth while to show at length how much better Bulwer managed his character and talent than Dickens, without enquiring whether Dickens's nature was equally manageable to begin with.

In *Blackwood* a new story begins about a fisher who, after being dumb for seventeen years, found his voice in a storm, fancied he had sold his soul for it, and became a great tenor. The "Abode of Snow" contains a very vivid description of the rope bridges, which are so trying to the nerves that the effort of crossing one is said to have aggravated the heart disease of which Lord Elgin died not many days after, and some thoughtful observations on the immemorial polyandry of Thibet, which the author ascribes rather to the population difficulty than to a survival of bestiality.

In *Fraser* Mr. Carlyle, or his first serious and systematic imitator, begins a very spirited and not uncritical abridgment of Snorro Sturleson; the present instalment reaches to the death of Olaf Trygvesson. There is a description of the remarkable salt island in Bayou Tèche. F. R. C. has another noticeable Rabbinical article: he enu-

merates from Maimonides five orthodox Jewish views on the subjects of the Messianic kingdom and the future judgment, and then points out passages in the Gospels and the Epistles which are addressed to one or other of these views, or in which one or other of them is assumed or asserted. It would be possible to follow the writer with more confidence if he seemed to be aware how precarious such a method must be. The first of a series of papers on German Home Life is depressing as aiming to prove the thorough ingrained barbarism of the nation which for the present can dictate to Europe. On the other hand, Charles K. Landis' account of his settlement of Vineland in New Jersey is exceedingly pleasant reading: in 1861 he bought forty-eight square miles of wilderness, on which there are already 10,500 people thriving and likely to thrive, and he has made money by his beneficence. His *modus operandi* was to sell on credit to settlers who would conform to the conditions of settlement which he judged favourable to civilisation. He is more explicit in showing how his plan paid for others than how it paid for himself. This is a pity, for he invites other land-owners to imitate him.

In the *Fortnightly*, Sir George Campbell explains his views about the Land Question, à propos of his paper read before the British Association at Belfast, which he thinks was misunderstood—because the revolutionary premisses attracted more attention than what he thinks the conservative conclusion. He is in favour of primogeniture in the widest sense as the rule of descent, but would give the life owner full power to sell, would maintain all the present burdens on land, and would multiply tenant-rights in every direction. Professor Cairnes criticises Mr. Spencer's views on social evolution principally with reference to Mr. Mill's assertion of the importance of moral action and individual initiative as a source of progress. The editor concludes his review of Mr. Mill's *Essays on Religion*, and incidentally indicates his own views on Christology: the point of divergence between him and Mill seems to be, that Mr. Morley assumes their common method to be absolute; while Mill, at least in his posthumous works, more or less explicitly recognised Aristotle's principle, that methods must vary with subjects. The merits of Mr. Symonds' article on "Lucretius" are depth and refinement of view rather than novelty of suggestion. The author of *Supernatural Religion* has not been able to wait for the completion of Professor Lightfoot's indictment to commence his reply; his haste enables him to assume that Professor Lightfoot had no substantial argument to offer on the merits of the case, because he began by some severe reflections on that author's remarkable method: he succeeds in skirmishing about the Professor's samples of the apologetic arguments which he left without reply in a style which does not damage his opponent or himself much; but readers will be more interested in the earlier part of the article, which contains his reply to the very definite charges of the Professor. The first of these referred to a passage of Irenaeus which Canon Westcott translated with explicit accuracy, and Tischendorf, who wrote in a more precise language, with pleonastic emphasis. The author of *Supernatural Religion* maintained that Westcott and Tischendorf falsified this passage, and understood it himself as meaning that Irenaeus quoted the fourth Gospel in his own person instead of saying that the elders quoted it. His interpretation was grammatically impossible, and he tried to support it by parallel passages. He is now aware that he was wrong, but still thinks he was not so wrong as Canon Westcott and Tischendorf, because their translations emphasise the meaning of Irenaeus, and do not leave room to entertain the hypothesis that he was mistaken, and was really quoting St. John out of his own head, or, at all events, was only quoting his contemporaries when he thought he was quoting his predecessors. The second charge is in connexion with the date

of Celsus, upon which the author thinks Origen changed his mind in the course of his work. Professor Lightfoot points out that the argument rests on a misconception of the force of tenses. The author replies that Tischendorf, in correcting a paraphrase of Volkmar's, translated as loosely as himself. The author relegates his other alleged mistranslations to a note; he had translated ὁ λόγος ἰδίου, "the word (? the Word) was declaring," "Scripture declares": his defence is that Prudentius Maranus renders the words "scripturam declarare," and Otto "effatum declarare." "The next passage is κατὰ κύριον προσηλασίζειν, which Dr. Lightfoot says is rendered 'to inflict a blow on one side:' but this is not the case"; nothing turns on the matter, and the author is fairly right. The author quotes Tertullian, who says of Marcion, "Lucam videtur elegisse quem caederet," "He seems to have selected Luke to mutilate." Instead of translating this, he "ventured to paraphrase" it as follows: "He seems to have selected Luke, whom he mutilates." The author is "extremely obliged to Dr. Lightfoot for pointing out two clerical errors which had escaped him." The first is this: "the words 'it is argued that' were accidentally omitted from vol. i. p. 113, line 19; and the sentence should read, 'and it is argued that it was probably a later interpolation;'" in the second edition the author substituted *probably* for *certainly*, without noticing the omission, which, as Professor Lightfoot observes, made him contradict his statement in vol. ii. p. 420, where he says, "I proceed to state my own personal belief that the words must have originally stood in the text." "The second error is in vol. ii. p. 423, line 24, in which 'only' has been substituted for 'never' in deciphering my MS." Another point on which the author spends three pages and a half is this—Dr. Westcott writes of Basilides as follows: "At the same time he appealed to the authority of Glaucias, who, as well as St. Mark, was 'an interpreter of St. Peter.'" The author still insists that Dr. Westcott was more or less to blame for more or less implying that Basilides said that St. Mark was an interpreter of St. Peter.

In the *Contemporary Review* Professor Lightfoot gives the following skeleton of the author's argument from "the silence of Eusebius:" A knows nothing of B, for C does not say that A says anything of B, and proceeds to test it by the facts. He explains Eusebius' own account of the objects for which he should quote citations and references to the New Testament in previous writings, and then compares the programme and its execution, with the result of showing that numerous quotations from the New Testament in extant writers are not mentioned by Eusebius as having no connexion with his object, which was simply to test the authority of the disputed books, and to throw light on the origin of the undisputed, whence it follows that we can infer nothing from the fact that Eusebius has no quotations of a given book from writers who only exist in his quotations, and in general, that since Eusebius has no quotations to establish the genuineness of St. Paul's thirteen letters, the Acts or the Gospels, his silence proves that no Church writer had ever disputed the genuineness of any of these to his knowledge. In the remainder of the article the Professor exhibits in parallel columns the way the author treats the passage of Irenaeus in his first and his fourth edition. We hope Professor Lightfoot will not take leave of the author without an acknowledgment of his real vigour and ability. An able man who reads up a subject to answer the question he imposes on it is sure to make mistakes, and, if he is an eager partisan, to stick to them: it would be absurd to test a constitutional argument of the seventeenth century by the standard of scientific history. Dr. Arnold gives a third and very interesting instalment of his "Reply to Objections to *Literature and Dogma*," which is mostly taken up with a reply to the "mechanical" criticism of a Westminster Reviewer, whom Dr. Arnold cannot help identifying with the author

of *Supernatural Religion*. In the course of this reply we have a very striking sketch of the course of Hebrew religion from Abraham to the author of the book of Daniel. In a future number Dr. Arnold promises to give us his views on the external and internal evidence of the Fourth Gospel. Professor Max Müller's reply to Mr. George Darwin is one of the explanations of which an author who, with many higher gifts, is so plausible as to be often misunderstood, has to make many. It was hardly necessary to disinter Montalenibert's article on Rome and Spain, written five years ago to prove that Spain was ruined by the union of spiritual and temporal despotism, a system for which the Jesuits of the *Civiltà Cattolica* are responsible, through the Spanish Jesuits of the sixteenth century were not. Mr. Greg's article on the Obligations of the Soil is a development of the following *ignoratio elenchi*. Democrats hold that the soil being a limited gift of nature, ought to be administered for the common good and notably so as to grow more food: if the land be administered exclusively so as to grow as much food as possible, we shall have no animal food, no meadows, no woods (except on cold mountain-sides), no heaths, hardly any open spaces—all which democrats would dislike; *ergo* all the private rights to which democrats object are good.

In the *New Quarterly Magazine* Lewis Parker gives some very discouraging "Leaves from an Emigrant's Journal in Canada;" John Latouche supplements his Notes of Travel in Portugal with some observations intended to be practically instructive. The Portuguese hoe is better for planting cabbages than the English spade, but the Portuguese plant them year after year on the same ground, and have no idea of the rotation of crops. They raise maize year after year on the same ground, because they use gorse, gentians, moss, ferns, &c., torn up by the roots, instead of straw in their cattle-sheds, whereby they get three times as much manure and have all the straw for feed. The Portuguese women who work in the fields all have from five to thirty pounds worth of gold jewellery; and a camellia tree in full flower is very ugly, for at any one time three-fourths of the blossoms are withered and brown.

THE circumstances under which Christian IV. of Denmark signed the Treaty of Lübeck in 1627, and withdrew from all participation in the Thirty Years' War, receive elucidation from the despatches of Sir Robert Anstruther in the Public Record Office. Up to the end of April Christian was pressing for aid from England, and he had received assurances from Charles that with the supplies which he hoped to obtain from Parliament he would send all the help that he could need. The quarrel between King and Parliament, however, which was consummated in the violent scene of March 2, put an end to all hope of subsidies, and Charles ordered Anstruther to inform the King of Denmark that though he would do what he could for him, he must have patience.

Christian's answer was given on May 2 (O.S.).

"Necessity," is Anstruther's account of his reply, "hath no law, which causeth me to have patience par force, but wishes withal of God he had known sooner what he might have expected, thinking it much that in so short a time those hopes which were given and sent him by your Lordship's directions, and delivered by mine own servant, should so soon be changed, seeing that upon those assurances he had scraped together what he could to make a head against his enemies, and refused indifferent good conditions of peace that were offered unto him, saying plainly it will be hard for them to answer one day to God, who have drawn him into this labyrinth, wherein he runs not only hazard of his life and crown, but of his reputation, of which he hath ever been very tender, and moreover that now he could not be able to work so good a peace for his friends and neighbours as formerly he could have done, nor so honourable for himself, and his posterity. He hath been thus plain, and withal writes that if I had been as careful in soliciting aid from England for the maintenance of the common cause, as I was in

soliciting him to undertake this business and persuading him to the continuance of it, and feeding him from time to time with fair words and promises, he would then have had greater cause to approve my diligence than now he hath."

The Peace of Lübeck was signed ten days later on May 12 (O.S.). There can be little doubt that we have one more instance of the deleterious influence which the strife between Charles and the House of Commons exercised upon the course of Continental politics.

NOTES OF TRAVEL.

WE invite the attention of our readers to the appeal of the Council of the Royal Geographical Society for subscriptions to meet the expenses connected with Lieutenant Cameron's gallant attempt to trace the course of the Lualaba, and so to complete Dr. Livingstone's discoveries. This appeal certainly deserves a liberal response from the countrymen of Cameron. Alone, and in the face of extraordinary difficulties and perils, this young officer is gallantly striving to achieve a discovery which will redound to the credit of England. We are confident that the appeal for help will not be made in vain.

THE German Polar Committee at Bremen, which was so active in promoting the despatch of the *Germania*, is taking steps to secure the equipment of a fresh Arctic Expedition. It is desired that our Geographical Society should strengthen the hands of Dr. Fiusch and the German geographers, in their representations to the Imperial German Government, by expressing its sense of the value and importance of the proposed undertaking; and we do not doubt that their wishes will be complied with by Sir Henry Rawlinson with all possible goodwill and heartiness. If the idea is promptly made to take definite form and shape, a German expedition may be utilised to very good effect, in a general scheme for the examination of the unknown area round the Pole. It would proceed, like the *Germania*, to the east coast of Greenland, and could then usefully co-operate in the discovery of the northern boundary of that vast mass of land. The direct distance from Hall's farthest up Smith Sound to Cape Bismarck, the most northern point seen by the Germans on the east side, is about 540 miles. This distance must be doubled if the coast tends much to the north. McClintock made a sledge journey of 1,200 miles, which can be repeated. So that the united efforts of one of the vessels of our Arctic Expedition on the west side, and of a German Expedition on the east side of Greenland, could, under the least favourable circumstances, complete the discovery of the whole northern side. This will be a geographical feat of the first importance, although only a portion of the work to be done. We wish the German Polar Committee all possible success in their efforts to secure the despatch of an expedition.

THE names of the two Arctic ships will of course be changed; indeed, that of the whaler that has been purchased could not be adopted, as there is already a *Bloodhound* in the service. It has been suggested that the memory of Captain Cook's memorable voyage to the North should be revived, and that the ships of the Arctic Expedition should be named the *Discovery* and *Resolution*. We believe, however, that the names will be those of two later Arctic navigators, and that the two ships of our new Arctic Expedition will be the *Parry* and the *Franklin*.

COMMANDER A. H. MARKHAM, the second in command of the Arctic Expedition, arrived in London on the evening of the 2nd, having been telegraphed for from Lisbon. He will proceed immediately to Dundee, to enter six experienced men as ice quartermasters. Captain Nares is expected to arrive in London, from Hong Kong, on the 17th or 18th inst. We trust that the appointment of the other officers will be promptly

made; for the importance of giving them as much time as possible for preparation cannot be over-rated. As it is, there is barely sufficient time to make all necessary arrangements.

WE are glad to hear that that distinguished surveying officer, Major Godwin Austen, assisted by Lieutenant Harman, was appointed to accompany the force employed to reduce the Duffla tribes to order, on the northern frontier of Assam, during the present cold season. A valuable addition will thus be made to our geographical acquaintance with the least known, but not the least interesting, part of our Indian frontier, namely, that which divides Tibet from Bengal and Assam.

As an instance of successful acclimatization, the introduction of chinchona cultivation into British India is most remarkable. For the plants have not only been transplanted from one quarter of the globe to another, but they have been converted from wild to cultivated products. The beneficial results of bringing quinine and the other febrifuge alkaloids in the chinchona bark within the reach of the people of India certainly cannot be exaggerated. Chinchona cultivation in India was commenced in 1861. In 1874 there were 2,649,033 plants on the Government plantations of the Nilgiri Hills alone; besides private plantations, among which 234,531 plants and 469½ ounces of seeds have been distributed. In the same year 91,773 lbs. of bark were supplied to the manufactory, for the preparation of quinine, in a cheap form for use in India, the value of which was 2,204l.; and 1,181 cases of East Indian and Ceylon bark were sold in the London market. The tallest chinchona tree on the Nilgiri Hills is now thirty-two feet high, with a girth of 28½ inches.

THE project for a ship canal across the Darien isthmus is still occupying the attention of American engineers. The Commission for the examination of the inter-oceanic canal routes met at Panama this month, to consider the reports already made. The choice lies between Nicaragua and Darien, the Tehuantepec route requiring too many locks. The Nicaragua route, it is understood, is considered certainly practicable.

THE survey of the section of the railway across the Andes from Buenos Ayres to Chile, which lies between Mendoza on the east side of the Cordillera and San Felipe on the west, has been completed. The plans of the line between Mendoza and Buenos Ayres are also finished; and it would be difficult to find, in any part of the world, a tract of country presenting such facilities for the easy and cheap construction of a line, as that selected by Messrs. Clark and Co. for this great inter-oceanic railway. The great difficulty is the passage of the Andes, which will be effected by way of Uspallata.

AN official account from Guayaquil says that a road is being made by the Government from the pass on the mountain Chimborazo, at the altitude of 13,530 feet above the level of the sea, to the village of Playas, which is about 250 feet above the level of the sea, making therefore a difference of level of about 13,280 feet in sixty-five miles. Some forty miles of this are completed, at a cost of upwards of 25,000 dollars. The road passes through Guaranda, San Jose de Chimbo, Chuctu, and Valsapamba. The labourers on it, of whom there are about 300, receive 2 reals or about 8½d. a day.

It is reported by the Swedish papers that Professor Nordenskjöld will conduct a new Arctic expedition, the object of which is not especially to advance to the North Pole, but to carry on scientific investigations in the polar regions generally.

It is stated that two officers of the Consular service have been attached, as Chinese interpreters, to Colonel Browne's expedition, which, as we recently remarked, is about to explore the trade-route from Bhamo to Talifoo in the Yün-nan

province. It is intended, we hear, that the party should afterwards work its way along the valley of the Yang-tze-kiang, and having made a thorough investigation into its capabilities from a commercial point of view, finally proceed to Shanghai.

THE meeting of the International Geographical Congress which was announced to take place at Paris at Easter, has been postponed till July, in consequence of the numerous applications for space at the Geographical Exhibition which have been already addressed to the President, Vice-Admiral La Roncière le Noury, and which have consequently led to the necessity of securing a larger building than had at first been thought necessary. The exhibition will, it is announced, be held in the Palais de l'Industrie or in a building to be erected specially for the purpose, and will include plans, maps, charts, drawings and books referring to geographical subjects, as well as instruments and machinery, and useful products of foreign countries, together with objects of European industry. The Commission appointed to organise the entire scheme have in contemplation to publish a journal of Commercial Geography, for which they have solicited contributions.

THE French Department of Marine has just published some details respecting Martinique (among other colonies) from which we observe that the population in 1871 was 156,108, being an increase of 2,181 over that of the previous year. The imports amounted to 33,138,770 francs in value, and are pretty equally divided between France and foreign countries, but of the exports, which are rather more than the imports in value, two-thirds go to France, the chief article being sugar, which represents not less than half the value of the exports.

A SAN FRANCISCO correspondent of the *Augsburg Gazette* alluding to the enormous emigration of Chinese thither, remarks that were it not for them the fish and vegetable markets would be almost closed and all railway works would be stopped, not to speak of other scarcely less important branches of industry, to which their presence is equally essential. Every trade is to be seen represented in the Chinese quarter, including some photographic colourists who have just arrived and do a thriving business. There are eighteen Chinese doctors in the town, one of whom has handsomely furnished chambers and often a dozen patients waiting to see him, while six assistants are generally preparing his medicines, which are exclusively vegetable ones. Of anatomy they have no knowledge, though they know of some remedy against small-pox which has acted most efficaciously in the case of several outbreaks. There are twenty eating-houses in the city where all recognised Chinese delicacies are obtainable, such as stuffed dogs, fricasseed rats, birds'-nest soup, &c. On ordinary days the price is absurdly cheap, but on rare occasions the chief Chinese merchants feast the municipal authorities, and the price then rises as high as several dollars per head.

THE *Kölnische Zeitung* announces the appearance at Mayence of the second volume of the Hebrew missionary Eben Saphir's narrative of his travels in Egypt, Arabia, India, and Australasia, which although begun as far back as 1854 have not been fully made known till the present time. Eben Saphir, who is a Pole by birth, was originally engaged by some of his co-religionists at Jerusalem to report upon the social condition and general status of the Jews scattered over the various districts of the Indian empire and the Australian colonies, and in 1866 he published a volume of the notes which he had written down in Hebrew during the course of his travels. This volume gives a *résumé* of his personal observation of the condition, habits and usages of the Jews in the different countries which he visited, while the concluding part of his travels is devoted to the

consideration of the traditional literature, biblical commentaries, and manuscripts in use among them, in regard to which he has made some very interesting and important discoveries. It has been announced that a German and English translation of the original Hebrew will speedily appear.

LONDON GOSSIP IN 1723 (GATHERED FROM SOME MS NEWS LETTERS).

"London: 23 April 1723.

"On Saturday last y^e King went to y^e Theatre Royal in Lincolns Inn Fields to see y^e Comedy called y^e Merry Wives of Windsor. And last night y^e Prince & Princess went thither to see y^e Comedy call'd Cutter of Coleman Street, in both w^{ch} was y^e Entertainment of Dancing in Burlesque Characters call'd Jupiter & Europa, or y^e Intreagues of Harlequin. It is observed that this season has been very fruitful of New Plays.

The close of last week Capt. Roberts of y^e Horse Guards and Robt. Dillon Esq. fought a duel near y^e Cocoa Tree in Pall Mall, wherein both were dangerously wounded."

"27th April 1723.

"They write from York y^e y^e Archbishop's son was married to M^{rs} Roundel last Tuesday 7 night, she has £500 a year & £3000 in money, y^e Bridegroom is about 19 and his Bride about 15 years of age."

"15th June 1723.

"We have had large demands upon us on account of the Civil List w^{ch} our Parliam^t cheerfully & readily complied with. What has occasioned y^e Exceedings on y^e head has been y^e great Pensions granted to Persons of different Nations; did we not live in an age where virtue & honesty flourish in y^e strongest manner, it might be insinuated y^e when a House of Commons grants money with much alacrity & cheerfulness, they give as a Body what y^e particular Members y^e formed y^e Majority expect to receive a share of, and thus are bribed by y^e publick Money to enter into Measures w^{ch} must tend to y^e Destruction of y^e State.

"Yesterday dyed at his House in Soho Square in a very advanced age y^e Earl of Bradford Lord Lieu^t of y^e County of Salop, his L^dship is succeeded in hon^r & Estate by his son y^e Lord Vis^t Newport, to whom an Estate is left by his Father of about £13000 a year.

"The Prince & Princess went this evening to y^e Theatre in y^e Hay Market to see y^e Opera called *Flavius*."

"18 June, 1723.

"Yesterday at 3 in y^e afternoon a Fire broke out in warehouses belonging to some Turkey Merch^{ts} behind Billiter Square and soon destroyed y^m & y^e Goods, amongst w^{ch} were 60 Bales of silk valued at £10000. The House of Col. Porteen where S^r Randolph Knipe formerly lived & 2 or 3 others were burnt down. Some of M^r Poveys New Invented Bombs to extinguish Fire were made use of & did good Execution. Two other new Invented Engines were also work'd, w^{ch} by y^e help of 4 men turning two wheels sucks y^e water into a Leathern Pipe, w^{ch} can be carried to y^e Top of any House or in any Room, & at one end forces it out at y^e other end with a constant stream.

"There were this day great numbers of Persons of Distinction at y^e Tower to take leave of y^e late Bpp. of Rochester [Atterbury], who about noon went on board y^e Navy Barge accompanied by M^r Morrice, his wife & some others. . . . He was in a Lay Habit attended by two Footmen in purple Liverys. When he departed from the Tower Wharf many of y^e Spectators were uncovered'd, & with Loud voices said, God be with him."

"20th June 1723.

"The Trade of Spittlefields is so much increased y^e great numbers of weavers both Papists & Protestants have come over from France & Holland & settled there. 'Tis computed y^e within

these 18 months past above 1,000 Houses have been built there & inhabited."

"29 June 1723.

"The Town of Battersea about 3 miles from this City being y^e place of y^e Lord Bolingbroke's Nativity have Rung y^e Bells for sev^l days successively on acc^t of his L^d's arrival, & yesterday when he appeared in publick a Hogshead of Strong Beer was given to y^e Towns people who drank his health & afterwards made a very large Bonfire by way of Rejoycings."

"1st Octr 1723.

"On Sunday last y^e R^t Hon^{ble} y^e Lady Russel Relict of y^e Lord W^m Russel y^t was Beheaded departed this life at Southampton House in Bloomsbury Square, aged 86, by whose death we hear a good sum falls to y^e Dutch^e Dowager of Rutland & an Estate of about 5,000*l*. a year to y^e Duke of Bedford."

"17th Oct 1723.

"This morning Dr Halley, King's Professor of Astronomy, gave y^e Lord Chancellor an account of y^e Blazing Star y^t hath appeared for sev^l evenings last past. It rises at 7, & is discernable in some measure by y^e naked eye, but by y^e help of Telescopes they can Discern y^e Star in y^e Middle of what appears like a Blaze."

"7 January, 1723.

"Tis very surprizing to hear y^t Bishop Burnet's History of his own times w^{ch} y^t Pious Prelate solemnly devoted to y^e Eternal God of truth sho^d by some people be deem'd a Romance, the report of others, hearsay, and y^e like; & y^t those people should likewise give out y^t y^e 2^d part of y^e Bpps History w^{ch} relates to y^e Reyns of K. W^m & Q. Mary has not y^t consent for its publication as was expected."

"11th January, 1723.

"Yesterday at 5 in y^e morning ended y^e Ball in y^e Hay Market, a great number of Ladys went from y^e Lord Viscount Falmouths in Masquerade dresses. His M^y and y^e Prince were present at y^e Theatre in Habits. The Dress w^{ch} was y^e wonder of y^e Assembly was a Walking Statue with 2 heads; it's computed y^t above 1,000 Persons were there.

"This afternoon y^e Archb^{pp}. of York arriv'd in Town at his House in Cecil Street from York City with a numerous Retinue, having with him 2 Coaches and 6 besides 20 Horsemen."

BOSTON LETTER.

Boston: Dec. 22, 1874.

Mr. Emerson's *Parnassus* appeared last week. It is a good-sized octavo of more than five hundred pages, with a brief preface by the compiler. The only rule he adopted in the selection was to insert such poems, or parts of poems, as he liked, and certainly the book gives evidence of a catholic taste. From Chaucer there are extracts a few lines long as well as the story of Griselda; there are some of Shakespeare's sonnets, and brief selections from the plays; oddly enough, Mrs. Browning's "Lady Geraldine's Courtship," and the "Rhyme of the Duchess May;" yet of William Blake only "The Tiger," "The Sunflower," and the singular "Orthodoxy;" of Landor only two lines, the "Inscription on a Sea-Shell." On the other hand, there are very copious and just selections from many other poets. The greatest space, nearly one hundred and fifty pages, is devoted to narrative poems and ballads. Probably no one will be perfectly contented with this compilation, for the reason that it is made by some one else, but it cannot fail to give a great deal of satisfaction. It is to be noticed that many of the poems are given in mutilated form, and Mr. Lowell's "Hosea Biglow's Lament" is purged of its Yankee dialect, and, with very slight changes, printed in academic English. This was done by the author, at Mr. Emerson's request.

The preface is interesting. Mr. Emerson says:—

"The poet demands all gifts, and not one or two only. Like the electric rod, he must reach from a

point nearer to the sky than all surrounding objects, down to the earth, and into the wet soil, or neither is of use. The poet must not only converse with pure thought, but he must demonstrate it almost to the senses. His words must be pictures, his verses must be spheres and cubes, to be seen and handled. . . . Coleridge rightly said that 'poetry must first be good sense, as a palace might well be magnificent, but first it must be a house.' Wordsworth is open to ridicule of this kind; and yet, though satisfied if he can suggest to a sympathetic mind his own mood, and though setting a private and exaggerated value on his compositions, and taking the public to task for not admiring his poetry, he is really a master of the English language; and his best poems evince a power of diction that is no more rivalled by his contemporaries than is his poetic insight. But his capital merit is that he has done more for the sanity of his generation than any other writer."

There are many extracts from American poets, though none from two valued more highly in England than here—namely, Walt Whitman and Joaquin Miller; what is more to be regretted is that the book contains, naturally, none of Mr. Emerson's own poetry.

It is understood that the preparation of this volume has caused a delay in bringing out the volume of Essays, which is probably postponed until another year. Mr. James Lowell's volume may be looked for, however. Among other announcements is that of a volume of short stories, which have appeared in various American magazines during the last few years, by Mr. Henry James, jun. Mr. James is now writing a long novel in the *Atlantic Monthly*, to run through the whole year.

I would most earnestly call the attention of the readers of the ACADEMY to a reproduction, by the heliotype process, of Blake's *Book of Job*, with an introduction by Mr. Charles Eliot Norton, which has just come out in this city. Of the plates Mr. Norton says with truth that they

"reproduce, with the closeness of a facsimile, the general character of the original engravings; but they fail to render the most delicate beauties of expression, and the finest touches of execution. The inmost, evanescent, vital spirit of the original is not to be found in these copies. But for what they do afford—the poetic and pictorial conception, the general composition, the distribution (though not the scale) of light and shade—these heliotypes are greatly to be prized, and by their means many a lover of art, who without them could know little of Blake's style, may gain a near and, so far as it goes, a true acquaintance with the best designs of the most spiritually imaginative of English painters."

As was only natural, Mr. D. G. Rossetti's interpretation of the different plates is largely quoted from, but in the remarks explanatory of the fifth of the series Mr. Norton observes that

"it seems to me that there is a clear distinction between the fires that surround Satan, and which he pours on the head of Job, and the flames of light with which the shrinking angels are clothed; and they, indeed, seem to shrink away, not so much in compassionate horror, as in dread of contact with the deathless fires in which Satan burns."

Mr. Rossetti, it will be remembered, gave the explanation which Mr. Norton quotes but rejects.

The introductory sketch is admirable. It is sympathetic but discriminating. Mr. Norton does not go so far as Mr. Swinburne in praise of the *Prophetic Books*. Speaking of the *Marriage of Heaven and Hell*, he says:—

"It is a book of abundant but most erratic genius, in which childishness and maturity, wisdom and folly, strength and weakness, plainness and obscurity, imagination and understanding, humour and passion, paradox and truism, poetry and prose, content and share in a bewildering and unexampled fashion. The book is the expression of the free play of an impulsive genius, bound by no laws but those of its own making; and it would seem as if Blake, with little hope of the acceptance by others of the doctrines he had to propound, gave himself no pains to render them intelligible to the common reader, and pleased himself with the indulgence of his own eccentric humours. In this

quality it is like the work of a child, who expects no followers, and looks for no converts, but amuses himself with an impossible world of his own imagining, more important and absorbing to him, for the time, than the actual world of the nursery, the schoolroom, and the garden. Blake was a most childlike man childlike in simplicity and faith: childlike even to childishness, as mystics are apt to be, in the indulgence of wayward moods, and in the defect of the sense of proportion between individual conceits and the wisdom of mankind."

The whole essay is well worth reading, and, with its artistic criticism, which is only too brief, admirably supplements Mr. W. M. Rossetti's introduction to his recent edition of Blake's poems. The book is very nearly the handsomest that has ever been published in this country. It is from the press of James R. Osgood and Co.

Yesterday took place with appropriate ceremonies the dedication of Hitchcock Hall, which contains the new Congregational Library. The building is an excellent one for the purpose for which it is designed. It differs from every other library building in the country in being absolutely fire-proof. The shelves alone are of wood. The rest of the building consists of brick, stone, and iron, even the windows having iron sashes. It has room for 123,301 volumes, and it is expected that half or two-thirds of the space will be immediately filled. It is intended to supplement older and larger libraries, especially in the branches of biblical, exegetical, statistical, biographical, ecclesiastical, and historical research.

In the *Nation* of a week or two since there was a notice of one of its editorial staff, Mr. John Richard Dennett, who died about a month ago. I cannot add anything to that article, which was a discriminating as well as a warm tribute to a man whose loss is deeply mourned by the few who knew him, while it is at the same time a serious blow to the literature of this country. He held by far the first position among the young men in criticism; his disapprobation was the more noticeable in a land where "genial" criticism is the rule, and his praise was all the more valued because it was never won by pretence. His own sincerity made him able to separate sharply the false from the true; and while he was merciless to shams, he was always glad to recognise genuine merit. Every word that the *Nation* said about him was true. His death was indeed a heavy blow.

CORRESPONDENCE.

THE ORIGINAL OF SHAKESPEARE'S "OTHELLO."

Casa della Vida, Venice.

That Shakespeare's *Othello* was founded on one of Cinthio's novels is one of the common-places of literary history. But it has not been noticed that there are circumstances in the play which are not to be found in the novel, or that the personage whose history was transformed into the story of the Moor is to be met with among the heroes of the Venetian Republic. A few notes, therefore, regarding the relations between Venice and Cyprus at the time when Othello is supposed to have visited that island will not be out of place.

In 1471, one Giosafat Barbaro went on an embassy from the Republic of Venice to Usong Hassan, or Uzun Huseun, and wrote an account of his travels, which was published by Aldus; the narrative being so graphic that an English version of it may be read among the publications of the Hakluyt Society.

Giosafat Barbaro landed at Famagosta from Venice, shortly before the death of the last of the Lusignano kings, whose consort was the noble Venetian gentlewoman, Caterina Cornaro. After a brief sojourn at the Cypriot court, the ambassador proceeded towards Persia, and, stopping on the way at a city called by him Chuerch (Karman-shah, on the Kerkha?), he tells a tale which (although he protests against his own entire belief in it) has subjected him to the charge of childish credulity. His story purports that in this city of Chuerch there was a spring, or pool, the waters of which not only cured leprosy, but saved grain-crops from the destruction caused them in Cyprus by the locusts. His words are as follows:—

"This water is said to have great efficacy against leprosy and against locusts, of one and the other of which plagues I will not say that I have had any experience, but that [I have witnessed] the credulousness of certain persons [with regard to their antidotes]. At that time a Frenchman, with some servants and Moorish guides, was going that way to the said pool, with what result I know not, but it was said publicly that many persons were thus cured. Whilst I was still in that town, there arrived an Armenian who, long before I set out, had been sent by the King of Cyprus to bring some of that water; and two months afterwards, I being in the country on my return, after my arrival at Tauris, he came back with the water in a tin flask. He accompanied me for two days, and then went on his way towards Cyprus, where I, finding myself on my homeward voyage, saw that identical flask of water suspended on a pole projecting from a certain tower; and the natives of the place assured me that, owing to this water, they had no longer any locusts; and there I also saw certain red-and-black birds, called 'Mahomet's birds,' which fly in flocks like starlings; and as he told me, in like manner in Cyprus when I was returning, these birds destroy all the locusts they can find, and in whatever place this water may be, they instinctively fly towards it, as asserted by the peasants there."

The last King of Cyprus died the year after Giosafat Barbaro gave this account of Mahomet's birds; and the crown of his widow, Caterina Cornaro, passed to the Republic of Venice in 1489. The Signory vested the government of the island in a lord-lieutenant, six councillors, superintendents, a treasurer, Captain of Paphos, and a Captain of Famagosta, *alias* of Cyprus; each of these officials to be of Venetian birth, elective by the Grand Council of Venice. And in the years 1506-7 the veracity of Giosafat Barbaro was officially confirmed by the lord-lieutenant then in office (by name Christopher Moro), now known far and wide under the pseudonym of Othello, and whose despatches received at Venice on May 22, 1506, and June 26, 1507, inform the State that "the locusts were doing mischief, although the water, their bane, had arrived."

"That the locusts had damaged the wheat, and that the reason assigned was, the water had been spilt, so that they had sent others into Persia to fetch the said water; it takes them eight months to go and return."

On October 16, 1507, the Senate listened to the perusal of another despatch from the Lord-Lieutenant of Cyprus concerning wheat and "the water of Costanza;" which name, at Venice, was then doubtless the synonym of Barbaro's "Chuerch," and may perhaps give a clue to the pool whose waters cured lepers and destroyed locusts; and although the fact may sound no less improbable than those stories of

"Men whose heads

Do grow beneath their shoulders,"

which interested Desdemona, and facilitated the suit made to her by Othello, the circumstances narrated by Giosafat Barbaro were nevertheless gravely listened to by those potent, grave, and reverend signors who formed the Venetian Senate.

Fronting the summit of the "Giants' Stair," where the Doges of Venice were crowned, there are still visible four shields "spotted with mulberries" ("strawberries" in the description of Desdemona's handkerchief), indicating that that part of the palace portal on which they are carved was terminated in the reign of Christopher Moro, whose insignia are three mulberries sable and three bends azure on a field argent; the word "Moro" signifying in Italian either mulberry-tree or blackamoor.

In July, 1460, this Doge wrote rather a stringent letter to James King of Cyprus, implying that he had trifled with the affections of Caterina Cornaro, and the consequence was that she forthwith became queen-consort of the island, and ruled it for sixteen years after her husband's demise, which took place in 1472, one year after that of the prepotent prince to whom she may be said to have owed her crown. Doge Christopher Moro effected indirectly the annexation of Cyprus to Venice in 1460; and in May, 1505, as a reward for military and diplomatic services, the Grand Council elected his namesake—Christopher Moro, son of Lorenzo—lord-lieutenant of the island, where he remained, after his term of service had expired, and by reason of his being thus accidentally on the spot he was appointed to defend it from an hypothetical attack which, according to report, was meditated either by the Soldan, the Sofi, or the Turk. This statement exists in the summary of a despatch from Christopher Moro's successor, the Lord-Lieutenant Lorenzo Giustinian, who adds that he and the counsellors had "elected Christofal Moro captain of the fourteen ships detained by them from fear;" and it is a curious coincidence that the tenour of these official advices from Cyprus corresponds precisely with the causes assigned for the subsequent despatch of "Othello" from Venice for the defence of that island, as in act i. scene 3 of Shakespeare's tragedy. And, finally, the return of Christopher Moro to Venice is recorded in Marin Sanuto's Diaries, thus:—

A.D. 1508.
October 22. "Item. The ship from Syria arrived, having on board Christopher Moro, on his return from the Lord-Lieutenancy of Cyprus.

1508.
October 26. "In the morning there presented himself to the College, Christopher Moro, returned Lord-Lieutenant from Cyprus, and elected Captain in Candia, wearing his beard for the death of his wife [Desdemona?] on her way from Cyprus, as heard previously, and he made his report."

Sanuto has not transcribed the Moor's "Report," so we do not know whether it alluded to the "locust water," or to his wife's death; but, at any rate, the despatches of the Lord-Lieutenant may be said to have tested and confirmed the veracity of his countryman Giosafat Barbaro, who, according to the Barbaro genealogies in the Correr Museum, died at Venice in 1494, and was buried "behind the grotto in the monastery of San Francesco della Vigna."

To return to Christopher Moro. He was decidedly a lady's man, as according to Barbaro's genealogies he was married four times. Nor should it be forgotten that the tale, whether told

by Cinthio or Shakespeare, must have its incidents dated between 1486, when Catherine Cornaro abdicated in favour of Venice, until the fall of Famagosta, in 1571. Further, Moro's military exploits in the Romagna, against Caesar Borgia, and subsequently during the League of Cambrai, as recorded by the Venetian historians, and by an inscription which once existed in the Palazzo Pretorio at Padua, would warrant his saying of himself, "I have done the State some service, and they know it."

Cinthio's novel, it may be added, would never have sufficed Shakespeare for his *Othello*. The Italian described Desdemona's handkerchief as a "nose-napkin" (*pannicello da naso*), and says it was most delicately wrought, but does not give the design, which reveals the whole thing. Had he called things by their right names, the sale of his book in Venice would have been prohibited. *Othello* came out in 1611, according to Malone; Chalmers says 1614, and Drake 1612; and as among the Venetians in England from 1603 to 1615 there were the secretary Scaramelli, and the ambassadors Duodo, Correr, Francesco Contarini, and Foscarini, from one or other of them, or from some of their attendants, Shakespeare—who may perhaps have been struck by some English translation of Cinthio's tales—might easily have ascertained the true story of his Othello.

RAWDON BROWN.

STATUE TO KING ROBERT THE BRUCE AT STIRLING.

Bellevue, Chelsea : Jan. 5, 1875.

A few months ago I was applied to by my friends north of the Tweed to subscribe to a monument to King Robert the Bruce, described as "a statue surmounting an appropriate pedestal," to be erected on the Castle Hill, in Stirling. Having done so, as a patriotic Scotchman should, I found, on receipt of the printed papers, that the designer of the statue in question (the sculptor, in fact) was Mr. George Cruikshank, and that the artist had submitted his design to the Queen at Windsor, who had "most cordially approved of it," and that the site has been granted to the committee by the Secretary of State for War.

Struck by the coincidence of the name being the same as that of our comic draftsman of veteran years, and having some misgiving as to a comic statue of the old chivalrous king being the right thing, I wrote to the secretary for the undertaking—Mr. W. Christie, of Stirling—enquiring into the antecedents of the sculptor employed, and received for answer that he knew nothing of him except that he lived in the Hampstead Road!

If you will kindly print this letter, perhaps we may hear something more of him. I am aware that Mr. Cruikshank has faith in himself, but it is only since his day, and very lately indeed, that we have had comic artists of great educated ability; and however much we may enjoy his humour, it is impossible to look upon his art with pleasure; and a public statue is one of the things that ought to be protected from experiment.

I may mention that the statue in question is stated to cost not more than 1,200*l.*, the half of which seems already subscribed.

WILLIAM B. SCOTT.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, JAN. 9. 3 p.m. Royal Institution: Professor Gladstone on "The Voltaic Battery; the Electric Telegraph" (Juvenile Lecture).
8 p.m. Ballad Concert, St. James's Hall.
Miss Ada Cavendish in *The New Magdalen* at the Charing Cross Theatre.

MONDAY, Jan. 11,	5 p.m.	London Institution: Professor Armstrong on "The Life-History of Plants and Animals."
	8 p.m.	Medical.
	"	Monday Popular Concert, St. James's Hall (Mdlle. Krebe).
TUESDAY, Jan. 12,	8.30 p.m.	Geographical.
	3 p.m.	Royal Institution: Mr. E. Ray Lankester on "The Pedigree of the Animal Kingdom."
	8 p.m.	Civil Engineers. Photographic. Anthropological Institute.
WEDNESDAY, Jan. 13,	8.30 p.m.	Medical and Chirurgical.
	3 p.m.	Literary Fund.
	8 p.m.	Archaeological Association.
THURSDAY, Jan. 14,	"	Geological. Graphic. Royal Society of Literature.
	8.30 p.m.	Royal. Antiquaries.
	3 p.m.	Royal Institution: Professor Duncan on "The Grand Phenomena of Physical Geography."
FRIDAY, Jan. 15,	6.30 p.m.	Royal Society Club.
	7 p.m.	London Institution: Professor Rolleston on "The Early Inhabitants of England."
	8 p.m.	Chemical. Mathematical. Inventors' Institute.
	8 p.m.	Philological: Mr. F. T. Elworthy on "The Dialect of West Somerset."
	9 p.m.	Royal Institution: Professor Tyndall on "Some Acoustical Problems."

SCIENCE.

Records of the Past; being English Translations of the Assyrian and Egyptian Monuments. Published under the sanction of the Society of Biblical Archaeology. Vol. II. Egyptian Texts. (London: Samuel Bagster & Sons, 1874.)

THE second volume of the *Records of the Past* contains the translations of fourteen ancient Egyptian texts. Some of these texts are in very sober prose, and are of importance for the history and geography of very remote periods. Of the poetical compositions two are of historical interest, the others are sacred hymns. Of the remaining texts three are decidedly works of imagination, whilst a fourth describes a Syrian journey, the reality of which is a very fair matter for controversy.

The inscription of Una, now completely translated for the first time, is of prodigious antiquity. I hope no one who reads this will be scandalised by my saying that its date is probably more ancient than that assigned on the margins of English Bibles to the Deluge. Una was in the service of several Egyptian kings in succession, the first of whom, Teta, is the thirty-fourth on the royal list of the great temple of Abydos. The royal names of this period (corresponding to the sixth dynasty of Manetho) stand in the following order on the tablet dedicated to his predecessors by Seti I. of the eighteenth dynasty: — Unas, Teta, Userkarā, Merirā, Merenrā, and Neferkarā. This order is in perfect harmony with inscriptions contemporary with the sovereigns bearing the names just quoted. Una, who in his youth enjoyed an honourable position at the court of King Teta, rose to the highest offices first under Merirā, and then under Merenrā. The relative chronological positions of Unas and Neferkarā are equally well established. The inscriptions still extant of Sabu, surnamed Abeba, a high functionary under King Teta, speak of him as being already a distinguished officer under King Unas. And the inscriptions of the queen of Merirā are still extant, which show that King Neferkarā, her son, was the younger brother and successor of Merenrā. There is a long series of such texts completely independent of each other,

containing perfectly credible statements relative to comparatively short periods of time, and as free from what Sir G. C. Lewis calls "the tendency of the Oriental mind to enormous numerical exaggeration," as the statistical records upon the tombstones of our own churchyards. It is the study of this series of texts which compels us to admit the succession of monarchical rulers in Egypt extending back to a very remote antiquity. The antiquity of Una as compared with what we have been taught to regard as the earliest extant literature may be estimated by the fact that he flourished at the commencement of the sixth Egyptian dynasty—Unas was the last king of the fifth—whilst the writer of the Pentateuch, whoever he was, was familiar with a royal name of which no trace can be discovered till the nineteenth.

The inscription of Una consists of fifty lines, and at present we possess no more ancient Egyptian text of the same extent. There are, indeed, very much older inscriptions (for instance, the religious text on the coffin of king Mycerinus, and the very remarkable ones in the tomb of Chu, in Lepsius' *Denkmaeler*, ii. pl. 43), which prove that the language of Una, like the religion professed by him and the whole social and political organisation of Egypt, had flourished for centuries before him; but as compared with the language written during the eighteenth dynasty, or even the twelfth, it presents some remarkable archaic forms. The difficulties in the way of translation have been most successfully overcome by Dr. Birch wherever success was possible. Unfortunately, translation is not all that is required to make a text thoroughly intelligible. The nature of the charges borne one after another by Una must for a long time at least be a matter of doubt or controversy to archaeologists. The names of many localities at that remote period necessarily baffle all geographical investigations at present. But these difficulties, far from being in themselves insoluble, tend gradually to disappear before fresh accessions of knowledge. The splendour and extent of the reign of Pepi Merirā over the whole of Egypt was already known from monuments found in all parts of the country, and even in the Arabian peninsula. But we learn from Una, who commanded this king's armies in the war with two great nations, that Ethiopia also was subject to the royal rule, and furnished important contingents of negro troops. Under the supreme direction of Una for the organisation of the army, we find the heads of the priesthood of both Upper and Lower Egypt; a sufficient proof that in the older as well as in later times no such thing as a sacred caste existed like that in India. The warlike reign of Pepi Merirā, which lasted for at least eighteen years, as is known from an inscription in Wady Maghāra, was followed by a period of profound peace, and Una, who was governor of all Upper Egypt under the successor of that monarch, was chiefly occupied in great works of public utility.

The most important inscriptions of Thothmes III. (of the eighteenth dynasty) are translated by Dr. Birch, and among them the inscription of Amen-em-heb, accidentally

discovered a year or two ago by Dr. Ebers. This invaluable text, containing the biography of an officer of no very exalted rank, like several other texts of the same nature, confirms and completes the information furnished by the official royal inscriptions of Thothmes III. and his successor Amenophis II. It is from this source that we learn, among other things, that the former of these two kings died in the fifty-fourth year of his reign, and was succeeded by the latter, his son. The annals of Thothmes III. have unfortunately come down in a very mutilated condition. The walls on which they were inscribed are mere ruins, from which whole blocks have disappeared. The records of the twenty-fifth, twenty-sixth, twenty-seventh, and twenty-eighth years are wanting, and the order in which the remaining fragments should be read, some of which are in Paris, must be determined by their contents. Some of the numbers which appear in the present translation require revision. "The forty-second year," at page 47, line 11, is clearly a misprint for "twenty-fourth," but "the thirty-second year" is a mistake of the copy from which Dr. Birch has made his translation. It is so evidently at variance with the context that M. de Rougé long ago called M. Mariette's attention to it. This latter gentleman, after carefully examining the monument, wrote back saying that the number forty-two is still perfectly legible, though "l'un des chiffres dix a presque disparu par une sorte de dissolution spontanée de la pierre, et il est évident que si M. Lepsius a fait sa publication sur un estampage, il a dû lire 32." M. Mariette verified another correction at the same time, and M. de Rougé very justly observed that

"la science doit paraître établie sur des bases bien solides aux yeux de tout esprit impartial, lorsque l'interprète peut, de son cabinet, et malgré de larges lacunes, indiquer ainsi par avance le chiffre des corrections qu'on trouve ensuite sur les monuments par une exploration plus minutieuse."

The fragment printed at page 20, containing, as it does, records from the twenty-ninth to the thirty-fifth year, should evidently come between the fragment printed at page 42, which contains the events not later than the twenty-fourth year ("fortieth year" in line 32 being a manifest clerical error), and the fragment printed at page 48, which begins with events of the thirty-eighth year.

An important document of this reign might have found its fitting place here. It contains a list of the populations reduced to submission by Thothmes III. both in Africa and Asia. It is of great geographical interest, particularly as regards the nations composing the confederated army defeated by the Egyptian king in the battle of Megiddo.

The translations contributed to this volume by Professor Lushington and Canon Cook cannot fail to make Egyptologists congratulate themselves on the accession to their ranks of two such excellent scholars. The critical notes which Professor Lushington has appended to his translation of the Third Sallier Papyrus in the *Transactions* of the Society of Biblical Archaeology, show a most intelligent insight into the

difficulties of the Egyptian text. Canon Cook's translation of the long inscription of Pianchi is quite admirable both for its elegance and for its accuracy. Much as my own views differ from some which the learned Canon has greatly at heart in his commentary on the Bible, I am bound to say that his illustrations of the sacred text from Egyptian sources are thoroughly scholarlike, and as different as possible from what we have been accustomed to, either on the conservative or on the destructive side of the question.*

The travels in Palestine and Syria of a contemporary of the great Rameses, and therefore (according to the most competent judges) anterior to the Exodus of the Israelites, must necessarily be of the utmost interest. The narrative, however, is not told by the hero of it; it is, on the contrary, addressed to him. Had the journey with all its adventures really taken place? or is it the writer's intention to sketch a possible journey (just as we might a tour in Switzerland or Italy), strictly adhering to topographical facts and *couleur locale*, but drawing upon his imagination for the adventures of his hero? The question is by no means easy of solution. A great deal depends upon one of those problems of Egyptian grammar to which a very insufficient degree of attention has yet been paid. I am not alluding to the use of the negative particles which occur frequently in this narrative. M. Chabas is most unquestionably right in translating them in an interrogative sense. The whole context requires this sense, and it is incredible that another should have been proposed. My difficulty is this. On reading M. Chabas's translation I constantly find verbs in the past tense, "Didst thou not then go?" "Hast thou not seen?" "Hast thou not trampled?" "Hast thou not penetrated?" "Wentest thou not?" "Didst thou not meet?" "Let me tell all that happened to thee at the end of thy road?" If the corresponding Egyptian expressions are equally definite in the use of a past tense, then indeed there can be no doubt that the writer meant to describe a journey which had taken place. But in every one of these instances, and others of the same kind, the Egyptian verb may quite as correctly be translated by a present tense, and if the present tense be substituted for the past, the whole context will be consistent with the hypothesis that the writer's intention is simply, "I have made for thee the portrait of the Mohar, I have travelled for thee through foreign provinces," as he says at the end of his work, in M. Chabas's version. It is not right, however, to confine the evidence to this portion of the papyrus, and it is much to be regretted that all the earlier portions of it which have been translated by M. Chabas have been omitted. They are indispensable as aids to the interpretation of the later sections, and some of them are highly interesting for their own sake.

* I may perhaps here mention one illustration which has escaped Canon Cook at Judges xx. 2, and 1 Sam. xiv. 38. It has not yet, I think, been noticed by anyone. The use of the word "corner" for *chief-gain* is certainly a reminiscence of the Egyptian *Rebet*, and is particularly striking in Isaiah xix. 13.

Mr. Goodwin has translated one of those sublime hymns in which the dominant note is decidedly monotheistic. It is in honour of the Creator and sustainer of all existences, the father of the fathers of all the gods, the one god without a peer, whose name is hidden from his creatures. He is the Lord of eternity, and the everlasting Maker, causing all things which are to exist, the Lord of wisdom and truth. He is at once the Lord of terror most awful and the Lord of mercy most loving. He it is who raises the heavens and fixes the earth, who makes grass for the cattle and fruitful trees for men, who makes the birds to fill the air, and gives breath to those in the egg, feeding the bird that flies, giving food to the bird that perches, to the creeping thing and the flying thing equally. He provides food for the rats in their holes. If he consumes his enemies with flame and subdues the wicked with his eye, he lies awake whilst all men sleep, seeking out the good of his creatures; he is gentle of heart when one cries to him, he listens to the poor who is in distress, and delivers the timid man from the violent. The conception of a self-existent Creator of all things is extremely ancient in Egypt, but the form in which that conception is expressed, as in the beautiful hymn of which I am speaking, is met more frequently in productions of the eighteenth and nineteenth dynasties. The "Lamentations of Iris and Nephthys," translated by M. de Horrack, are not less interesting in their way. This composition appears to have had a liturgical use. It was to be recited on behalf of the dead. The rubric at the end directs that during the recital two handsome women should sit on the ground with the names of Iris and Nephthys inscribed upon their shoulders, crystal vases full of water in their right hands, and loaves of bread made in Memphis in their left hands.

The most difficult of the Egyptian texts translated in this volume is that entitled "The Instructions of King Amenemhat I. to his son Usertesen I." (or rather "User-sen," i.e. "their wealth" or "power").* This and the other documents contained with it in the Second Sallier Papyrus are the most difficult in the whole range of the Egyptian literature now extant. The Prisse papyrus perhaps contains a larger number of words as yet unintelligible to us, but the grammatical structure of the sentences is easy enough. The text of the Sallier papyrus defies all grammatical rule. It appears to me to be hopelessly corrupt and in many parts impossible of translation. In saying this, I am pronouncing no opinion against the truthfulness of the version of M. Maspero, who has had the use of the unpublished Millingen papyrus. This, he says, "is correct enough, and when entire contained the whole of the work; it is unfortunately mutilated at the end, and fails exactly where it is most wanted." The uninitiated must therefore not be scandalised if they accidentally come across a version by Dr. Duemichen widely differing from that of M. Maspero. The two versions are really made from different texts.

* A certain number of Egyptian proper names consist of nouns such as *life*, *strength*, &c., accompanied by *my*, *his*, *her*, or *their*. These pronouns refer, I believe, to the parents of the person.

But let us hope that so highly valuable, nay, so indispensable, a text as that of the Millingen papyrus may not be allowed much longer to remain unpublished.

M. Paul Pierret contributes the translation of a short text which is, perhaps, not quite correctly described as "the Egyptian account of a scene of investiture with the Chain of honour." The investiture, as M. Pierret himself observes, is not mentioned in the text, and it is only one of the scenes represented on the tablet. The volume finishes with two novels, the first being the "Tale of the Brothers," translated by myself; the second the "Tale of the Doomed Prince," unfortunately a mere fragment, translated by Mr. Goodwin.

P. LE P. RENOUF.

SCIENCE NOTES.

BOTANY.

THE tree-aloes of South Africa rank with the most remarkable of vegetable forms, and until quite recently were almost unknown. Professor Dyer collected all information relating to them he could obtain, and published it in the *Gardener's Chronicle* for May 2, 1874. This article is illustrated. Fresh material having come to hand, he was able to correct an important error of his in the article cited, and in *Nature*, December 3, 1874, he gives a summary of the present position of our knowledge of these singular trees. It contains some points of interest worth reproducing. The species of *Aloe* are probably only really indigenous in south and east Africa, though *A. vulgaris* is widely spread in the Mediterranean region and elsewhere, but only as a cultivated plant, or an escape from cultivation. *A. indica* of Royle is doubtless a variety of the preceding, as is also probably *A. littoralis* of Koenig, found at Cape Comorin, the difference in character being due to altered conditions of situation. In some rocky districts the tree-aloes form the dominating feature of the landscape, giving it a very peculiar appearance. The eastern species occasionally attains a height of 60 feet. There are two species of tree-aloe in South Africa—one endemic on the west coast, and the other confined to the east. That of the west, *A. dichotoma*, Linn., extends from Walvisch Bay to Clanwilliam. It is well described in Paterson's *Travels in Africa* (1789), but otherwise very little known. The present Governor of the Cape, Sir Henry Barkly, has made great exertions to procure plants for Kew, and two have now arrived in this country, the largest being eight feet in height, but there is some doubt whether they will eventually survive the voyage. The eastern species, *A. Barberae*, Dyer, was named in honour of Mrs. Barber, who first sent cuttings of it to this country. *A. dichotoma* attains a height of thirty feet, with a girth of about twelve feet. *A. Bainesii*, Dyer, turns out to be the same species as *A. Barberae*, the character of scattered or clustered leaves having broken down in this instance. The specimen named *Barberae* had its leaves originally arranged in rosettes at the ends of the branches, but as it grew they became distant and scattered. There are still some slight discrepancies to clear up with regard to the flowers.

THE Algo-lichen theory shadowed forth by De Bary (*Handbuch der Physiologischen Botanik*, p. 29), and developed by Schwendener ("Ueber die wahre Natur der Flechten," in the *Verhandlungen der Schweizerischen Naturforschenden Gesellschaft in Rheinfelden*, 1867, pp. 88-90), and in numerous subsequent articles published in various periodicals, is gaining supporters. Several other investigators, and notably Bornet (*Annales des Sciences Naturelles*, 5^e série, t. xvii. p. 45, and t. xix. p. 314), whose first article is illustrated by a series of

eleven beautifully executed plates, have taken up the subject. To make these and the following references intelligible, we may set forth the substance of the theory as briefly as possible, using the words of M. Bornet. It consists in regarding lichens as compound organisms, consisting of an alga and a particular species of fungus living parasitically on the alga. Of course this involves the partial destruction of the present constitution of the families of the lower cryptogams, and the utter annihilation of numerous "genera," and has naturally aroused opposition on the part of the lichenologists. It is not our intention to attempt to decide between the contending parties, but a few words on the present position of the question may be interesting. A fuller examination of the subject, by W. Archer, will be found in the *Quarterly Journal of Microscopical Science*, 1873, p. 217, and 1874, p. 115. Mr. H. A. Weddell gives a more recent summary of the presumed discoveries in this direction (*Comptes Rendus des Séances de l'Académie des Sciences*, t. lxxix., séance du 23 Novembre, 1874). Fries combats this theory very strongly (*Lichenographia Scandinavica*, Pars prima). Dr. Müller (*Flora*, 1872, p. 90) takes the same view, as also Dr. Wylander, and many other noted lichenologists. On the other hand, it is gaining many adherents on the Continent. In the article by Weddell, referred to above, he states that Dr. Gibelli, in a recent communication, says that he had undertaken the cultivation of the gonidia of *Opegrapha varians*, and after a certain time he had the pleasure of seeing the gonidia submitted to observation develop into magnificent *Chroolepus* (*Tentrepohlia*), which successively produced sporangia and zoospores. This is only one of many instances in which the gonidia of lichens have developed into organisms which have been pretty generally accepted as independent beings, belonging to the algae; but this may with equal consistency be regarded as a different state of the lichen. However, we are told that the gonidia of widely different lichens actually develop into the same alga. Another difficulty in the way of the new theory—though Bornet declares it of little importance—is the fact that hitherto no one has succeeded in cultivating a perfect lichen thallus from spores. Mr. Treub (*Onderzoekingen over de Natuur der Lichenen*, Leyden, 1873) carried his experiments in the cultivation of gonidia and spores beyond those of Bornet. Weddell (l. c.) says, once prove that *Stigonema*, *Sirosporon*, and allied genera, are true algae (usually considered as the imperfect state of free gonidia of lichens), and you destroy the principal argument raised by the opponents of the algal-lichen theory. Recent investigations, he thinks, have removed all serious doubts on this point. Whoever may be right, the impetus this new theory has given to original research has advanced our knowledge. Without accepting or rejecting the conclusions of either party, we should consider the production of a perfect lichen thallus bearing apothecia from the spores as more conclusive than the presumed parasiticism and development of the gonidia into fertile algae.

Dr. Hector, the Hon. Mr. Fox, and other observers, have recently made some communications to the Philosophical Society of New Zealand, from which it appears that the colony is threatened with a very formidable and disastrous plague in the form of ergot in rye grass. It does not actually kill either the sheep or cattle, but it seriously affects their fertility. They suffer in autumn only, when they reel about helplessly and are violently convulsed. The only remedy is to remove them to native pastures.

In the last part of the *Transactions of the Linnean Society* (vol. xxx. part 2), Mr. Miers monographs the genera and species of the Lecythidaceae, the order to which belong the *Bertholletia excelsa* or Brazil nut, and *Lecythis ollaria*, the large woody capsules of which are known as "monkey-pots." The Lecythideae are treated by most English writers

(including Bentham and Hooker) as a tribe of the Myrtaceae; Mr. Miers, however, prefers to follow Richard and Lindley in retaining them as a distinct order, characterised by the remarkable "androphorum" or ring that bears the stamens, which sometimes becomes petaloid; the ovary almost always inferior, with from two to six cells, having a small number of ovules either suspended by funicles from the axis, or basilar, erect, and sessile; and the fruit of the nature of a pyxidium with opercular dehiscence. The order is divided into twelve genera, among which are distributed nearly two hundred species; several of the genera and a large number of the species being now described for the first time. The paper is illustrated by thirty-three magnificent plates, containing analyses of the important features in the characters of each genus, and drawings of the fruit of many of the more interesting species.

BIOLOGY.

Vital Phenomena Common to Animals and Plants.—Continuing our account of M. Claude Bernard's lectures, reported in the *Revue Scientifique*, we find him strongly asserting, in opposition to the heterogenists, the Harveian doctrine *omne vivum ex ovo*, "the egg or ovule being the point of departure of any thing endowed with life, whether animal or plant, mammal or infusorian." Reduced to their simplest form, the complex phenomena of sexuality appear as two cellular elements, and in the history of an egg or ovule, M. Bernard recognises two stages, pre-fecundation and fecundation, in both of which the two sexual elements are concerned in animals and in plants. Before fecundation, the egg is an apparatus constituted by the concurrence of two cellules, that of Purkinje and that of Balbiani. It should here be mentioned that the "embryogenic vesicle," the appearance and development of which M. Balbiani traced in the eggs of a spider (*Tegenaria domestica*), in a series of observations held to be conclusive by M. C. Bernard, is a *germinal* centre distinct from the *nutritive* centre, which he places in Purkinje's vesicle. According to the theory of pre-fecundation, the concurrence of the two elements confers upon the ovule a power of attaining its completion as an egg, after which, in the higher animals, a fresh sexual impulse is necessary to the formation of an embryo, and its development, but in aphides, for example, the original impulse suffices to carry the egg on through all the stages to the perfect aphid. The conception of the "primitive hermaphroditism of the egg," started by Von Baer in 1828, and re-affirmed by Barthélemy in 1850, seems established by the researches of Balbiani. The female element of the egg is thus the vesicle of Purkinje, to which the epithet "germinative" was formerly applied. "It comes," says M. Bernard,

"from an ancestry by an inclusion (*emboîtement*) of germs; it transmits the influence of previous generations, and represents *atavism*. Beside it is a recent formation, the male corpuscle, directly emanating from the mother, the vesicle, or cell, of Balbiani, which represents the *individual*, and readily receives modifying impressions from its surroundings. The ovule specially represents what belongs to the *species*, and that is the influence of ancestors.

"In the vegetable ovule there is a placental cord, a kind of thickening produced on the margin of the carpellary leaf, and which exhibits itself as a little mammillary prominence. It grows and surrounds its base with a double pad, which embraces it. This grows, ascends to the top, forming a continuous double envelope with a minute opening, the *micropyle*, the only communication between the exterior and the internal nucleus. At this period there is thus a nucleus with two envelopes. The nucleus hollows itself out; its cell-tissue becoming thinner in the centre, and more condensed at the periphery. It is thus transformed into a sac, analogous to the Graafian vesicle. Inside it the embryonic vesicle, analogous to the animal ovule, develops near the top. At the opposite pole appear one or more *antipodal cells*, whose enigmatical office probably offers strong analo-

gies to the cellule or vesicle of Balbiani, with which we compare them."

The process of fecundation requires the action of several of the male elements, or spermatozooids, characterised "by activity and disappearance through absorption in the female cell." From recent researches cited by M. Bernard, he regards spermatozooids as analogous to the embryonic vesicles, and believes that there is a parallelism between their formation and that of the egg, both resulting from a concurrence of the two sexual elements. He alludes with approval to M. E. van Beneden's theory, that there is "a morphological hermaphroditism in every animal individuality."

"In vertebrate animals," he says, "each individual possesses the elements of the male and female sex in the two primitive layers of its blastoderm, and if at a later period one sex only is manifested, it is because the other sexual element has aborted."

It is found in plants that if the pollen is not applied in sufficient quantities, the fertilisation is incomplete. The same thing occurs in animals, and M. Bernard thinks the phenomena of incomplete fertilisation have not been sufficiently studied. He is inclined to ascribe to it the fact of second or later offspring, often resembling the first males with which the females had contact.

Reviewing the various theories of the generation of organic beings, M. Bernard observes:—

"Leibnitz considered all the phenomena of the universe as the simple consequence of the primordial act, creation. The creative power intervened once, and had no need to repeat the effort, the natural order of things being determined for all time. He expressed this in the aphorism *semel jussit, semper parat*. According to him there is no fresh point of generation properly so called, no fresh creation; the first being contained potentially, and in substance, all succeeding generations, and the observer can only witness the development of germs which were from the first included one within the other. The Genevese philosopher Bonnet adopted this view. He thought no animal really created the beings of which it was the source, but that each one contained germs enfolding each other, and throwing off successive envelopes. According to this mode of thought, however numerous might be the generations whose germs were thus superimposed, they were still limited in number: however remote the final period assigned to each species, it is nevertheless irrevocably fixed. Cuvier, whose genius for precision ill accommodated itself to hypotheses, received this with favour. He thought it the most satisfactory that had been proposed to explain the mystery of the multiplication of living beings."

Regarding the production of each fresh being as a process of evolution from preceding genus, M. Bernard considers the theory of spontaneous generation, or heterogeny, as logically inadmissible, but still subject to experimental determination, and that he affirms to be entirely against it. "It has," he says, "been driven in succession from the positions it occupied, and forced into regions that are obscure or unknown." He concluded the lecture from which these words are taken with the following passage:—

"Sexuality is the paramount, universal, and necessary mode in which resides the true unity exhibited in the entire series of animals and plants. Its mechanisms may be very complicated and very numerous but physiological analysis succeeds in demonstrating their essential identity when reduced to their elementary conditions. We have seen that sexuality play the same parts in the animal and vegetable kingdoms and that their elementary mechanisms are the same and we thus obtain a new and powerful analogy to add to those which previous lessons have disclosed."

Accepting this unity in the organic world, can we stop there? Are we not led to conjecture that, as the imaginary boundaries formerly supposed to separate animals from plants have disappeared in the light of investigation, so the supposed limits separating the inorganic from the organic world will equally disappear when more is known of molecular physics? Is there no connexion between molecular and sexual bipolarity

There are some other points in M. O. Bernard's lectures which we reserve for another occasion.

Messrs. SCOTT AND GALLOWAY have published in the last number of the *Quarterly Journal of the Meteorological Society* their third paper on "Colliery Explosions and Weather," giving the figures for the year 1872. The results show a close accordance with those obtained for the previous years:—

Year.	Total number of explosions.	Barometer.	Thermometer.	Neither.
1868-70	550	49	22	29
1871	307	65	19	26
1872	223	58	17	25

The chief new feature of the paper is two curves showing the barogram at Glasgow, and the prevalence of firedamp in the mines for the last nine months of 1873, as ascertained from the records which are now kept, in accordance with recent legislation. The accordance of these curves is naturally more striking than the figures given by the explosions.

THE *Cologne Gazette* announces the death at Lund, in Sweden, on December 23, of the veteran entomologist, Professor J. W. Zetterstedt, who had reached the age of ninety. He held the chair of Natural History in the University of Lund from 1810 to 1853, and was noted as an efficient teacher and as a student of no inconsiderable merit in the department of science to which he had specially directed his attention.

At the December meeting in the Capitol of the Royal Accademia dei Lincei, it was decided that the prize of a gold medal, founded by Pietro Carpi, should be given for the best memoir upon Chemistry. An eulogium was pronounced upon their foreign member, the late Elie de Beaumont.

We have received the report of the Sixth Annual Session of the American Philological Association, held at Hartford, July, 1874. It gives ample evidence of the interest which the science of language is exciting in America, and with more careful weeding there is every promise of a valuable crop to come. There is a paper on "English Vowel-Mutation," present in "cag-keg," by Professor Haldeman. Many of the vowel-mutations, however, mentioned by the Professor are not English at all, and ought to have been treated in a more historical spirit. The change from *annual* to *perennial* had taken place in Latin, *annus*, *perennis*; the change represented by *charity* and *cherish* belongs to French; and with regard to *frantic* and *frenetic*, the change is neither English, nor a change from *a* to *e*, but from *e* to *a*.

In Mr. Fowler's paper on "Paradoxes in Language," there is the same absence of the historical method. *Black* is derived from the root *bha*, to shine, without any intermediate links. The transition of meaning is explained by the primary effects being light, brightness, whiteness; the secondary effects, a change in the colour of substances—blackening (or darkening).

Then follows an excellent address by Professor F. A. March, which has been published separately, giving an account of the work done by students of language during the past year. A paper by Professor Tyler on "The Prepositions in the Homeric Poems" shows the increasing number of verbs compounded with prepositions by statistical tables founded on passages from the *Iliad*, *Sophocles*, *Herodotus*, and *Xenophon*. Such statistics are useful if carried out, not mechanically, but in a truly scholarlike spirit, as by Tycho Mommsen in his researches on the preposition *pro*; otherwise what has been said of all statistics, viz., that there is nothing more deceptive, will apply to linguistic statistics also. Professor Sewall enters on a new discussion of the "Distinction between the Subjunctive and Optative Moods," and arrives at the following conclusions:—

"The subjunctive in conditional sentences differs from the optative in that it is a form to represent the fact as uncertain or contingent, while the optative is a form to represent it as merely conceived; and the

four classes of conditional sentences may properly be thus described:—The *first*, *ei* with the primary tense of the indicative, as a supposition relating to actual fact; the *second*, *ei* with the secondary tense of the indicative, as a supposition relating to contrary fact, or implying that the contrary is the truth; the *third*, *ei* with the subjunctive, supposition relating to contingent fact; *ei* with the optative, supposition of conceived fact."

Professor Packard discusses Hom. *Od.* x. 81-86; Professor d'Ooge, the original nombr of *αἰγιον* in Demosth. *de Corona*; Professor Short, the style of the Vulgate; Professor Whitney, the Proportional Elements of English Utterance; Dr. Trumbull, the connexion between the Numerals and the Names of the Fingers in the American Languages.

The next sitting was opened by the Rev. C. W. Ernst, with a minute analysis of the German vowels. He was followed by Colonel Higginson, who read a most interesting essay on the history of the idea embodied in the word *φιλανθρωπία*, and remarked that Max Müller's statement that "humanity is a word for which you look in vain in Plato or Aristotle," requires some qualification. The word *φιλανθρωπία*, however, means only love of man, which is now somewhat barbarously called *Altruism*, while humanity in the sense of the brotherhood of the human race, is, after all, a post-classical idea. It is difficult to judge of the character of a paper read by Professor Harkness "On the Formation of the Tenses for Completed Action in the Latin Finite Verb," from a mere abstract. Professor Fischer's remarks on the origin of *sunt qui* with the subjunctive, exhibits the true spirit of historical scholarship; and Mr. Morris, too, shows himself well read, in his paper "On the Age of Xenophon at the time of the Anabasis." Professor Whitney read a paper on the Relation of Vowels and Consonants, and constructs a theory of a new, but somewhat fanciful alphabet. Professor van Benschoten in his remarks on "Dr. Schliemann's Discoveries at Hisarlik," expresses his opinion that Dr. Schliemann, in spite of his over-great enthusiasm verging on insanity, has done the world an incalculable service. Dr. Keep criticises the Rev. Isaac Taylor's *Etruscan Researches*, showing that the author lacks discrimination as well as special knowledge. Dr. Trumbull's remarks on "Names for Heart, Liver, and Lungs," contains curious material. The last papers are—one by Professor Comfort, "On Helveticisms in Schiller's *Tell*;" an important essay by Professor Berghen, showing the Hamitic character of the Agau language, spoken by the Falasha Jews in Abyssinia; some notes by Professor Whitney, trying to show that *θῆναι* in language is *στῆναι*; and some remarks by Mr. Swinton on "English as the Universal Language." The next meeting will be held at Newport, R.I., beginning on Tuesday, July 13, 1875.

MEETINGS OF SOCIETIES.

ANTHROPOLOGICAL INSTITUTE (December 22).

PROFESSOR BUSK, F.R.S., President, in the Chair. Mr. J. Park Harrison exhibited tracings of late Phœnician characters still in use in the south-west of Sumatra. They differed entirely from early letters in other parts of the island. The natives had a tradition that some descendant of Alexander settled there; and if Nearchus' second expedition, the account of which is lost, and the Tyrian and Sidonian mariners who formed part of it, reached the Bay of Bengal, the date, Mr. Harrison considered, would agree sufficiently well with the letters.

Colonel Lane Fox read a paper on Early Modes of Navigation, in which he described the various contrivances employed by savage races for transit on the water. Commencing with the simple trunk canoe, the author traced the development of the art of boat and ship-building through the stages of stitched-plank canoes, bark canoes, rafts, outrigger canoes (single and double), the double canoe, the variation of hull, the weather platform,

the rudder, and the rude sail, and gave the distribution of their many forms and modifications. It was argued that the rude bark float of the Australian, the Tasmanian and the Ethiopian, the catamaran of the Papuan, the dug-out canoe of the New Zealander, and the built-up canoe of the Samoan were survivals representing successive stages in the development of the art of ship-building—not lapses to ruder methods of construction as the result of degradation; that each stage supplies us with examples of what at one time was the perfection of the art countless ages ago. Some of the more primitive kinds spread over nearly the whole world, whilst others had a more limited area of distribution. Taken together they enable us to trace back the history of ship-building from the time of the earliest sculptures to the commencement of the art.

FINE ART.

TWO ART BOOKS.

Roman Imperial Profiles, enlarged from Coins. Arranged by John Edward Lee, F.S.A., F.G.S. (Longmans, 1874.) It is quite possible that by this series of 160 lithographic profiles Mr. Lee will succeed in his desire to be "useful to coin collectors, especially those who are beginning to study numismatics." The scheme of the book is good, and particularly worthy of commendation is the idea of presenting the profiles without the distracting accompaniment of legend and border which numismatists insist on reproducing. But we would advise the general reader, to whom Mr. Lee next hopes they will be interesting, to suspend judgment and not to commit himself at once to "faith in the accuracy of the profiles," for in the first place it is obvious from the nature of things that the process of enlarging from coins must be beset with a danger of exaggeration which ought to be rigorously met by reference to such other authentic portraits as those of existing busts and gems wherever they may be available. With the small surface at his command the die sinker was compelled to intensify every little peculiarity of profile to satisfy the demand for realistic portraiture for which the Romans, following in the footsteps of the late Greeks, were conspicuous. Is it then possible for a modern artist to correct these exaggerations solely by means of a "knowledge of the anatomy of the human face"? We doubt whether it is, and we certainly cannot admit that it has been done in the book before us. Take, for example, the head of Trajan (plate xxxviii.) and compare it with the marble head of him in the British Museum. In the marble his low forehead and fleshy eyebrows constitute a remarkable, but neither an unpleasant nor an unnatural feature. In the plate they are made to destroy his intelligence and to render repulsive a face which the general reader at least would gladly look upon. Brutus again, there is no doubt, was in personal aspect far from the standard of Apollo or Adonis, but on the unmagnified coins and on a small amethyst in the British Museum the man is there recognisable behind his leanness, and this is more than can be said of plate iv. Portraits of Julius Caesar are to be found in a marble head and on two engraved gems in the Museum, and it has been not unfrequently the case that admirers of his career have expressed themselves satisfied with the resemblance to their ideal. Plate ii. will greatly disappoint them. As for Cleopatra (plate viii.) it may be said that not having had by nature a *Roman* profile, she might well have been omitted from the volume. Her charms lay not in her profile. We can look with pleasure on the fine cameo of Augustus in the British Museum, or on the numerous busts of him, and find no discrepancy between his features and the ideal suggested by the age of refinement to which he gave the impetus as well as a name. On the other hand, not a few—particularly among the female portraits of later times—appear to be highly satisfactory.

Indeed, the mixture of good and bad plates is precisely such as to support the statement with which we set out, viz., that a process of enlargement from coins must be guesswork unless checked by reference to other authenticated portraits. The short biographical notices which accompany the lithographs are expressly stated to be almost entirely translated from Mionnet. Still they are highly simple. On p. 60 we read DEO SARAPIDI (*sic*). If the *sic* is Mionnet's, it is of course his fault. Sarapis is now understood to be a better reading than Serapis.

The Types of the Gods and Heroes in Greek Art [*Heroen und Götter-Gestalten*]. By Alexander Conze. (Vienna.) With a book of this kind one turns first to the plates, of which there are here 106. The result is not one of unmixed pleasure, for this reason, that though the subjects are taken from works of ancient art exhibiting in themselves the greatest variety in point of execution, there pervades these plates an uniformity which must have stolen its way in from the imagination of the modern artist. Yet it would have been particularly agreeable had it been otherwise in a work like this, the object of which is not only to show how the forms and aspect of the gods and heroes were conceived and rendered by artists of the best time, but also to trace these conceptions to their earliest manifestation in existing monuments. Fortunately the transitions which occurred at different periods are sufficiently marked in the originals to remain still readily appreciable when taken along with the text for which, after all, it is to be remembered that these plates were intended to serve as illustrations. The text is admirable, as might be expected from the previous writings of Professor Conze, and this implies the greater praise since mythological research is a field in which he had not before appeared. Nor is it a field in which hitherto brevity has been aimed at, except with the result of some very stray shooting. If it is pardonable to pursue this metaphor, it might be said that Professor Conze is constantly scoring. Sometimes it seems as if what he gives in the way of mythology had been composed after a thoughtful study of Welcker's *Götterlehre*, followed by repeated visits to Greece itself, from which vivid impressions of natural phenomena had been brought back. Take, for instance, what he says of the goddess Athene. It was Welcker who had identified her as originally a personification of that light which dawns over the sky before the sun rises and seems to be quite independent of him—the same light which in the Mosaic account of the creation appeared and was approved on the first day, while the sun and moon were not created till the fourth. But it is Conze who, besides sparing the intricacy of Welcker, communicates to the description the freshness of his own sensations at daybreak in Greece. Or again, when the question concerns the wine god, we are invited to the vale of the Eurotas in May time, to visit the modern village of Parori, where numerous springs play among the old plane trees, and from the rustic verandah of an hospitable Greek we may overlook a sea of blossom and fruit, the golden orange in its dark foliage—a sight which Mignon had not forgotten—fig trees and pomegranates in wild profusion. These are the gifts of the god who in moist, well-watered districts produces all the precious juicy fruits, just as Demeter gives the grain. We are to remember that Dionysos was more than the god of wine, and that the gaiety of his festivals was not all inspired by it, but in certain districts at least, as among the stern Spartans of the Eurotas valley, arose from irrepressible joy at the aspect of nature in May time. It was the abundance of his gifts that struck the senses, and hence, like Hermes, he had, especially in early times, the characteristic of productivity. When the character of a deity has been thus mythologically interpreted, there follows a statement of the process by which with various stages it was embodied in marble and bronze or reflected in painting. At first the effect of this juxtaposi-

tion is surprising, since it would appear from the mythology that the further back a deity is traced the greater is found to be the hold which he had on the minds of his worshippers, while from the artistic remains of the same early times it is impossible to conceive that anything like a supernatural character could have been accredited to this or that god. But here we are warned that true piety is content with the merest symbol, and it is a point worthy of observation in the book now before us, that the symbols of the various deities, instead of being, as too frequently happens, mentioned in the fewest possible words, are appointed a conspicuous place. A symbol and an image are, it is true, two very different things, and if in time the latter superseded the former greatly in the Greek religion, it is not more than has occurred elsewhere. But it may be permitted to assume from the stories of images which had fallen from heaven that considerable scruples had to be overcome on the first introduction of images. The principle once granted, the most unshapely of idols would receive the same reverence as a symbol, and would cease to be questioned as to its physical likeness to the being whom it claimed to represent. These are some of the many questions which arise pleasantly in reading Professor Conze's book.

A. S. MURRAY.

WINTER EXHIBITION OF OLD MASTERS AT THE ROYAL ACADEMY.

(First Notice.)

THOSE whose duty calls them to a special study of picture exhibitions, and to whom the courtesy of the Royal Academy threw open their sixth Winter Exhibition on the first morning of the new year, were thankful for a daylight which the last evening of the old had not promised, and which has not been darkened since. So that by the time this is in the hands of our readers, many of them should have made themselves already at home among the pictures at Burlington House.

The collection is of such a scale and character that you can readily and happily make yourself at home in it. The vestibule and five rooms of the Academy's gallery are furnished, not crowded, with two hundred and sixty-nine paintings, all within comfortable distance of the eye. This, I think, is the smallest number of works that has ever been brought together at one of these shows. But among this number the proportion of positive masterpieces is high, and there is scarcely anything that has not some historical interest, or that—without respect to personal likes and dislikes—one has reason to wish away. Quality would here make up for quantity, even if the defect of quantity were itself a thing to be deplored. But the judicious student cares more to master and remember a few beautiful things than to skim and forget a great many. He will not be inclined to deplore the moderate number of works exhibited, or at any rate not for its own sake, but only if he takes it as a sign that the sources of these exhibitions are running dry. And that ought not to be. It is certain that in thus taking upon itself, only on a larger scale, the task of the old British Institution, and inviting together from right and left examples of the great ancient schools and of our own school down to its last stage but one, the Royal Academy does more than it could do in any other way for the interests of art in England. It is no less certain that the materials capable of being brought together upon such invitation, to our infinite instruction and delight, are as far as possible from being exhausted. What we have seen within the last six years has been little more than a sample of the vast riches which have dowed into this country from abroad, or been disseminated over it from within, from the sixteenth century till to-day. It has been little more than enough to tantalise us with thinking of the mighty and peerless public gallery, or system of galleries,

that we might possess in England if these treasures could be drawn forth, from the castles and manor houses and town and country palaces where they lie scattered, into the custody of the State or the great municipalities. That private zeal should have collected them is well; but that private custody should keep them in the dark seems to the lover of art, the lover of beauty and genius, the lover of the past, like an injurious infringement of his right to know and to enjoy. It is conceivable that a day may come when the State and the municipalities will be ready to bid for the works of the immortals at a price which the wealthiest private owner will not care to refuse. But till then, there is only one consolation for those to whom knowing and enjoying the works of the immortals is the salt of life; and that is when they are brought out from their places of shelter for occasions of exhibition and study like the present. Such occasions are expected with a growing eagerness. There is a growing public desire to make the most of them. And hence, one might hope, a growing motive for possessors to bring their treasures out. The pleasure to the student, the gain to his study, are so immense; the private inconvenience so slight. So great is the risk which science and the community run continually from the accidents of private custody, from neglect or fire; so small that which private interest runs from the accidents of transport and exhibition for the benefit of the community and of science. One might hope, I say, that considerations of this kind would press more strongly every day upon the possessors of old masters; and then the winter exhibitions at Burlington House would go on and prosper. But it looks a little as if those great collectors or inheritors of collections, who felt the force of such considerations, had done the best they could from the first, and as if those who failed to feel their force at first were not going to feel it now; and then it would be true, and lamentable as true, that the sources of the exhibition were running dry. Of the great English houses, only two contribute this time in any bulk to the collection; I mean those of Abercorn and Yarborough. Many of them formerly conspicuous by their absence are conspicuous by it still. The Queen has helped the exhibition before, and helps it again, with four examples of great interest. The Dukes of Buccleugh and Sutherland, Lord Delawarr, Lord Denbigh, Lord Fitzwilliam, Lord Heytesbury, the Dowager Lady Cowper, and Sir William Miles, all contribute. Many of the most interesting things belong to owners whose generosity has been tested over and over again, as notably to Mr. Fuller Maitland of Stanstead Park. Together with Mr. W. Graham and Mr. Cook—also a previous contributor—this gentleman furnishes the chief examples in the gallery of early Italian art. Several of the best English landscapes also belong to him. In this department Mr. Woolner sends, as usual, a valuable contingent. The contributors number altogether over a hundred, so that many of them send only one or two pieces each. Scarcely any school is absent. The French, as usual, finds very meagre representation; after two or three Claudes and Poussins, there is one Greuze and one Boucher for the last century, one Géricault and one Decamps for this. The English school predominates, as is also usual and natural. Macclise is the English history painter, and Calcott the English landscape painter, whom the President and Council of the Royal Academy have chosen among their late members to represent English art in what I have called its last stage but one. A paragraph at the head of the catalogue informs us that it had been their intention to add a choice from the works of Etty, but that this was unavoidably given up.

Certainly no exhibition of old masters has called for so little criticism as this on the score of pictures that would have been better away, or of titles and ascriptions due to the carelessness of

an owner or his delusion. Let the little that needs saying on either of these heads be said and done with. No. 190 is not by Luini, but by one of the late and weak hands of the Milanese school in its decay; and is full of repainting. No. 177 is given to a "painter unknown," whereas it is a valuable and perfectly indisputable fragment of Luca Signorelli. No. 188 is a fine specimen of the portrait art of Ghirlandaio; but the Sassetti were not counts. No. 130 is an injured—almost a ruined—Saint Catherine of the Venetian school, with her wheel of martyrdom and palm of recompense, and the emblematic unicorn in the landscape: we are informed that its title "Queen of the Gipsies" is a misprint in the catalogue for Queen of Cyprus (i.e., of course, Catherine Cornaro), though I do not think the features are hers. Scarcely less difficult to accept is the title given to No. 167. No. 51 is a work of suspicious appearance. Here and there a Venetian picture is set down to a master when it is due to a scholar. Here and there are some questionable names of those who have sat for portraits. If there are more points of this kind that need making, there will be plenty of eyes to detect them. Nay, I see that in some quarters points of this kind, and some of them quite imaginary, have been very ungraciously insisted on already. I pass from the negative to the positive parts of what I have to say.

Once or twice before, the English master or masters lately dead, whose works have been chosen for exhibition side by side with those of the old schools, have been accommodated apart. This time the histories of Maclise and the landscapes of Calcott are distributed at large among the Titians and Rubenses and Rembrandts and Vandycks and Claudes. The arrangement is very favourable to comparison and contrast. No school or period occupies any one gallery quite to itself. In the first room the older English school prevails in figure and landscape; with Hogarth and Reynolds and Romney; with two unsurpassable Gainsboroughs; with Stubbs and Morland; and, coming into our own century, with Crome, Cotman, and Brooking. But Gainsborough's exquisite *Sisters* smile across the room at Maclise's *Carton in his Printing Office*; and Cuypp and Ruysdael and Canaletto are there beside Collins and Calcott. The second gallery has nearly the same constituents, with additions from the Low Countries—a Ruysdael, a Teniers, a Vanderveelde, and several rare portraits of Vandyck. In the great third gallery the north wall is the place of honour; and here are half-a-dozen superb Venetian pieces with one or two not so good, flanked on either hand by a landscape of Turner and of Salvator, and beyond these by two boy portraits of Velazquez that make even the canvases of Venice look pale. On the opposite side of the room are two great Rembrandts, one of them from the collection of the Queen; at the west end a hurtling scene of the *Conversion of St. Paul*, by Rubens; with the intervals filled by portraits of Antonio More, Franz Hals, Vandyck, Reynolds, Gainsborough, and landscapes of Rubens, Ruysdael, Cuypp, and Turner. The fourth room is in part given up, by what has now become a kind of prescription, to the pictures of the earlier religious schools of Italy. Of the Lippis; the Crivelli; the two mystical altar-pieces of the Florentine school; the Signorelli aforesaid; a portrait piece by Ghirlandaio; a Fra Bartolommeo and an Andrea del Sarto; with a Saint ascribed to the early days of Raphael: of these and more I shall have occasion to say something next week. But they have not got the fourth gallery to themselves: they share it with more portraits of Vandyck, and with saints of Zurbaran and landscapes of Gaspar and Canaletto. Here alone are no English. But in the fifth room they prevail again—Morland and Zoffany and Wright of Derby and Opie, together with the greater Gainsborough and Reynolds, and in the company, once more, of Calcott and Maclise.

A natural way of taking such an exhibition, and

discussing the matters of criticism and history which it suggests, would be by separate schools. But I prefer to take the hint set by the system that has been employed in hanging. I propose to dwell on these points of contrast and comparison that arise not by separating schools, but by mixing them, and seeing how a succession of different schools deals with the same order of conceptions. Thus our study will be divided, not according to schools, but according to subjects. It will begin next week with the class of sacred pictures; and here, of course, the painters of Italy will predominate. We shall go on to portraits; and in this class we have masterpieces of all schools to consider together, with their affinities and their differences. Next will come landscapes and pastorals; and here the English will prevail, though we shall have to attend to other chords mightily struck before ever there was a school of painting in England. And lastly, we shall come to pictures of history and imagination not religious; in which—at least as to bulk—the work of our own countrymen will more than ever have the preponderance.

SIDNEY COLVIN.

THE WATER-COLOUR SOCIETY.

ONE can pass a very agreeable hour or two in the Gallery of this Society, looking at "the thirteenth Winter Exhibition of Sketches and Studies by the Members," which opened on the 4th instant. The average of the contributions is skilful, facile, and attractive, although not much beyond that can be said in favour of any of them save the fewest. The associates and the younger members of the body count for more, in the general result, than the elder members.

Four leading exhibitors are Sir John Gilbert, the President of the Society, Mr. Houghton, Mr. Pinwell, and Mr. A. H. Marsh. The first-named artist is very fairly represented by his *Prisoners of War*, an incident of the Parliamentary campaign in one of the northern counties; the *Notary Public and his Grandchildren* (from Longfellow's *Evangeline*), pleasant in composition and in feeling, though executed in a rather offhand fashion; and *Cade and his Rabblement*, howling and tramping through the streets of London with fire and steel, like so many devils broken loose. There are other works by this painter, including several small landscape sketches. Mr. Houghton makes a very bold venture in selecting as his subject *The Enchanted Horse (Arabian Nights)*; more especially as he does not represent the courser soaring upwards, as most painters would have done, so as to give the thing as much of an air of possibility as it will bear, but galloping right forward upon nothing. He is all coated with a curious coloured patterning, supplemented by elaborate housings. A flock of wild geese cross the sky behind the horse and his riders. To treat so eccentric a theme once in a way may be permissible to an artist having a somewhat exceptional direction of faculty; and no doubt Mr. Houghton has done with it what few of his contemporaries could have achieved. Another subject from the *Arabian Nights*—*The Transformation of King Beder*—is less bizarre, though still peculiar enough, and is proportionately more satisfying. Beder has been metamorphosed by the sorceress into a beautiful crane: she curtsies to him sarcastically—an action that has not a very oriental look—making a great display of the rich shawl-patterning of her skirt. Her female attendant, just behind her, smirks and sneers in unison. This capital work is replete with minute details, which are, however, for the most part, handled with considerable freedom. *The Fireside* shows a boy and girl taking their pastime on a tiger-skin rug: this picture, also, has no little oddity of aspect, and, as it is oddity with no particular meaning at the core of it, we incline to think it somewhat excessive. Mr. Pinwell takes two Moorish subjects, *The Prison-hole, Tangier*, *Women Visiting a Prisoner*, and *The Auctioneer*,

A Street-Scene, Tangier. Both these paintings have a pale warm brownish tone, much local character and choiceness of work, and more uniformity of ease than used to be the case with the productions, always remarkable for talent and uncommonness, of this artist. The principal faces, however, are stippled up to a morbid degree, not unfairly to be termed "finikin"; while some of the hands, on the contrary, are slurred. Mr. Marsh's picture is named *Love among the Roses*, and represents two young lovers of the last century standing slightly apart in a garden, with their backs turned to the spectator. Immediately in front of them is a green garden seat of awkwardly cumbrous make, and behind this is a clump of vari-coloured rose-bushes, to which a sunset-flushed sky forms the sole background. This is a work of rich sweet colour, and (as our description may already have indicated to the reader) of much peculiarity of general treatment; that sort of peculiarity which consists in reducing a subject to its barest and least suggestive rudiments, and then educing from these a certain harmony and delicacy, a nicety of poise and reserve of significance, which raise the thing up again into the level of artistic if not of intellectual conception. It is a sort of new start (now not a little in vogue) in the method of presentment; not worth trying at all until after the more obvious and more complete methods have been long in use and well worked out, but, under this condition, involving a kind of originality, and at any rate demanding, if it is to be in any degree successful, a great amount of aptitude and skill in workmanship. Mr. Marsh has managed to produce in this way one of the very best pictures in the Gallery. He has several others here, mostly of the landscape class; all worthy of notice, but none rivalling the *Love among the Roses*. Mr. R. W. Macbeth sends various productions, some of which may be referred to the same general principle of treatment as this one by Mr. Marsh; especially *A Favourite Customer* (the "customer" himself not being seen, but only the greengrocer and his daughter, who have their own trade-reasons for making him a "favourite"), and *Pleasant Hours*, which we cannot regard as a fortunate specimen of the style. Here we see a gentleman and lady seated on a bench under a tree, and looking as if the hours were anything but markedly pleasant to them. He leans forward, whittling at a twig: she sits backward, making a rather demonstrative display of a rose held against her knee, and bent (if we understand the subject aright) upon getting him to do or say something gallant in so opportune a *tête-à-tête*. Apart from some strong qualities of execution, we can find little of an attractive kind in this picture. The case is quite otherwise with another of Mr. Macbeth's contributions, entitled *Evening*—a domestic interior of remarkable refinement and grace. The husband is reading at a table, a little severed from the rest of the family—his wife, who sings as she touches the piano, grouped along with three girls and a boy. The only point which we can raise as an objection against this beautiful composition is that the relation between the lady and her juvenile auditors is too ambiguous. One naturally presupposes them to be her children; but her very youthful aspect—not more than twenty-three years of age, perhaps—negatives the possibility of her having a son of thirteen at the very least. It may be, however, that Mr. Macbeth has portrayed some real family exactly as they look, and then any such objection collapses into hypercriticism.

Mr. Watson exhibits no fewer than twenty-three water-colours. Among these we may specify *Barnaby Rudge*; *The Chimney Corner*—a gentleman, after a hard ride on a cold day, seated in the ingle-nook of a humble out-country inn, and lighting his pipe; *A Welcome Visitor*, a maid carrying hog-wash to the pig-stye, within which the impatiently expectant pig stands up, projecting his hooves and face over the door; and *The Lost Path*, where a gentleman and his daughter, plodding along in discomfort and bewilderment,

are asking their way of a clod-hopping boy. Mr. Walker exhibits a nicely-executed work, *The Rain-bow*; two girls looking out of the parlour-window of a country-house on a showery day. Mr. Haag has some sketches from the East. *A Nubian Youngster, Study of a Head*, has masterly ease and decision, and shows (like the Oriental studies of Mr. Frederick Goodall some years ago at the Royal Academy) how much superior to themselves some painters can be when, laying aside the attempt to produce works of artifice under the guise of ambitious compositions, picturesque or elevated, they go straight to nature, and paint with rapid vigorous directness what they see and know. An *Achmedeeh Derweesh, Study of a Head*, blinking in bright sunshine, is another example to the same effect. Two of this painter's architectural drawings—*The Interior of the Mosque of the Howling Derweeshes near Cairo*, and *The Door of a Mandarah in a Private House at Cairo*—have much forcible precision, resembling, and at least equalling, the productions of Mr. Karl Werner. Mr. Walter Duncan's best work bears as title a quotation from Longfellow's *Golden Legend*, showing how "the Monk Felix" was rapt into heaven by the singing of a bird in the forest. This is a well-designed single figure, with a good deal of expression in the face, though some final intensifying touch would be wanted to make it absolutely right and fine. Mr. Smallfield exhibits several works, mostly to be reprobated for mechanical smoothness, and lack of artistic impulse and insight: he used to do much better years ago. *The Jacobite's Daughter*, and *Volti Subito* (a lady playing music), are about the best. *Puck's Pranks* is a specimen of equally unintelligible and unintelligent arrangement. *The Duke's Minions*, though a good deal less defective, is a rather fallacious effort at ingenuity; it seems to represent two braves who, after committing a midnight assassination at the bidding of "the Duke," are clandestinely admitted into the palace by that Italian potentate's jewelled hand through the garden door. Mr. Shields sends only one contribution, executed in red chalk, and named *Summer Shade*; a little pastoral of two children, prettily done, but tending to the precise rather than the spontaneous in handling.

Having now passed in review the more important of the figure-subjects, we shall reserve for another article the landscapes and miscellaneous works.

W. M. ROSSSETTI.

RECENTLY DISCOVERED ANTIQUES IN ROME.

Rome: Dec. 31.

The prosecution of *scavi*, especially on the high grounds of the Viminal and Esquiline hills, where new streets and piazzas are springing up, continues almost uninterrupted in this city; and from time to time we receive report of truly precious treasure-trove. Valuable antiques pertaining to the Fine Art class among these discoveries are placed in two dim-lit halls of the ancient Tabularium on the Capitol; others, of less artistic price, in some chambers of a newly-built edifice for official uses on the same hill. The ultimate destination of all the sculptures dug up during recent years in Rome will be the Capitoline Museum, a gallery now open to the public with more liberality than in former times, and with admission gratis on Sundays. This Museum, due to the munificence and good taste of the Popes Clement XII., Benedict XIV., and others, will henceforth become the great storehouse of antique sculptures, discovered since the recent change of government in Rome.

The many mutilated statues, busts, and reliefs, provisionally placed in the gloomy halls of the Tabularium, offer a most interesting study of such *disjecta membra* here preserved from wrecks of antiquity. With exception of the busts—some beautiful and uninjured—these relics are all more or less damaged, in many cases (as apparent) either through wanton injury or the fall of crushing

material under which they have lain buried. Not a few might be singled out of the aggregate as entitled to rank among works of Graeco-Roman art pertaining to the best period—if not indeed among the masterpieces produced in Rome during that period which may be limited between the reigns of Augustus and the Antonines. Among those that claim attention, I may notice with particular praise a Hercules of heroic size (the limbs much mutilated, but the head entire), in the act of subduing the horses of the Thracian king Diomedes. Few remnants of the marble steeds were found, but the violently strained effort required for such action is most strikingly and intelligibly made manifest; the head, with firm-set features and closely curling hair, being of about the noblest and at once recognisable Herculean type. This fine sculpture was exhumed on the high level space near the western side of that Praetorian Camp which was first enclosed within the cincture of walls when Rome was fortified anew by (or rather in the reign of) Honorius. Three life-size athletes, nude, the limbs much broken but the heads complete, in which we recognise the nobler character of free-born and, perhaps, patrician youths enjoying the sports of the Palaestra, very different from that of hirelings on a public arena. These are, unquestionably, among the most valuable antiques lately added to Roman collections; and it is surprising that they have not yet been restored, or placed in the Museum where they might be seen to advantage. Among the finest of the statues left headless is one of Parian marble, which from the grace and softness of the general contours may be supposed to represent Bacchus—also from the trunk of a palm-tree beside the limbs, an occasional attribute of that god, who inscribed the letters invented by himself on palm-leaves. Admirable among the statues, which are almost reduced to the mere torso, is one in which we recognise a replica, among the many extant, of the famous Faun of Praxiteles. A pleasing statue of the youthful Amor fortunately retains its expressive head; and very pretty is the naïve and child-like statue (life-size) of a little boy in the act, apparently, of digging, or some other task, in which we see that he is exerting his utmost strength, though the mutilated arms no longer hold the implement, or serve to indicate the precise occupation of the young labourer. Another headless statue that claims notice is supposed to be the Genius of Augustus—nude, and with a cornucopia in one hand. In busts this collection is particularly rich. I may mention a Jupiter of the more benign type and with finely-marked features; Hadrian, very life-like, and Scipio Africanus, recognised not only by its resemblance to the bust in the Capitoline Museum, but also by the scar, distinctly indented, on the high bald forehead. Two busts of empresses, well preserved, are evidently the portraits of beautiful women—one (probably Julia Sabina, wife of Hadrian) distinguished by delicacy of contour and nobleness of character.

Beside these, the provisional Museum contains many fragments of ornamental sculptures, excelling in their way—e.g., a marble fountain in form of a large fat goose, and a splendid marble urn (also, probably, for a fountain), among the numerous fragments of which we may admire a spirited group in relief of a Satyr embracing a Nymph. Curious testimony to the mediaeval uses of antiques in Rome is before us in a heap of broken pieces, the wrecks of sculpture and architecture in marble, all which were found built up in the rude masonry of a wall, at some depth below the modern street-level.

The collection placed in the rooms of the new building on the Capitol is heterogeneous, and contains much which, if not artistic, is valuable. Here we see an immensity of *ex-votos* in terra-cotta—hands, feet, limbs, no doubt intended to be hung up in temples or before altars in token of gratitude to the gods or goddesses for recovery from disease; many iron implements for agriculture, &c.; heaps of things pertaining to the vanities of female toilet;

and some to the culinary class—as (I believe unique among hitherto discovered articles of the Roman kitchen and dinner table) two silver forks, each with two prongs only—affording proof that ancient Rome admitted the principle, once contested in England, concerning what one of our old poets calls

"the laudable use of forks,
For the sparing of napkins," &c.

Among funereal objects is a large cinerary urn of Oriental alabaster, two outer enclosures for which are extant, though now removed from it—one of lead, the other, like a huge box, of terra cotta. The most remarkable among sundry metallic implements is a long bronze staff with a flame-like apex, which part is hollow—this having served for a torch of the "Vigiles" (or Fire-brigade), found among the ruins of their *statio* in the Transtiberine quarter, the only one among several such barracks of ancient Firemen, discovered in Rome, which has not been swept away, or, after being discovered in a ruinous state, again buried after being cleared from the encumbering earth.

The report of objects dug up during the last month in the course of works for building, includes many that are valuable. Noteworthy among those of artistic character are the following: A semi-colossal statue of Bacchus, wanting an arm, part of one leg, and the drapery (probably a chlamys, which may have been of bronze, or at least detached from the figure). A colossal half-length statue of Hercules (or possibly Commodus), with the attributes of that god—the arms and hands included, the right holding a mace, the left with the apples of the Hesperides; the pedestal, which is preserved, having reliefs of military trophies, small figures of Victory, a celestial sphere, and the signs of the Zodiac, on its surface. A life-size statue of a young girl preparing for the bath; two semi-colossal female statues, both clad in the long tunic and peplos; a good bust, preserved entire, of a young man, probably a portrait, &c. Beside these art works there has been found a variety of terra-cotta *ex-votos*—heads, hands, feet, legs, and even entrails, so represented in token of gratitude for healing; also (all these dug up in laying foundations for houses in the Esquiline), 2,493 bronze coins, 2 silver coins, 54 objects of wrought glass, 73 styles and hair-pins made of bone, 25 lamps of terra cotta, bronze, and lead; 2 antique cameos on pietra dura, one on amethyst, the other on cornelian.

A judicious alteration in the Museum of the Capitol, lately carried out, is the transfer of the whole collection of bronzes from two small and badly-lighted rooms to a large hall in the palace of the "Conservatori," where they are much better placed and seen. The famous bronze Wolf with the Twins (both these being modern) stands suitably in the centre; and the last acquisition, made about a year ago, is a restored bronze chariot, from an antique covered with small laminae of bronze, in which are tiny bas-reliefs so much damaged that scarcely either subjects or any artistic character can now be discerned or estimated in them. On some of these laminae, however, one can distinguish the figures of Centaurs and Satyrs. The chariot was exhumed on the Esquiline; and, as it now stands in the Museum, almost the whole is a restoration on a wooden frame, serving to display the ornamental accessories which are antique.

C. I. HEMANS.

DR. FRIEDRICH MATZ.

MANY have watched, only too sure of the result, the long illness which has carried off at last the young Professor of Archaeology at the University of Berlin. But still the news comes like an unnatural shock. Compared with others he had done little, but yet for his short life very much. Indeed, it was characteristic of him how carefully he would measure his bodily strength, so as to

make it bear the greatest strain, and yet not be diminished; and this meant a constant practice of self-denial, both as regards what he himself was ambitious of doing, and as regards other work in which to be like or to help his fellows he would have gladly taken part. As a personal favourite, he had perhaps no equal among the archaeologists of Germany, and it was therefore with a welcome that those who before had been unable to work well under the former editors of the *Archäologische Zeitung* saw him appointed to this task some months ago. His contributions to the *Annali* of the Institute in Rome were marked by a singularly calm and patient thoroughness, which pointed him out as a person to whom a work of large labour might be trusted. So thought the authorities of the Institute when they placed in his hands the great task of publishing and interpreting the sculptures on all the existing Roman sarcophagi. Of these there are many in this country, scattered about in private collections. He had left them, I believe, to the last, and had even during two visits of some length succeeded in seeing all that were of the least importance. From other countries—Italy, Spain, France, and Germany—the material for his work was also collected, and probably not much more time would have been needed to see the whole through the printers' hands. It must be less than a year since he was appointed to the chair in Berlin made vacant by the untimely death of Friedrichs. Before then, but only for a short time, he had a chair at Halle. Like Brandis, he seemed born to form a link between men of the most varied temperaments. The link is snapped, but not with the strain in that direction. A. S. MURRAY.

NOTES AND NEWS.

AN Art Loan Exhibition was opened at Chester last Saturday which includes many really valuable paintings, both by old and by modern masters. The Duke of Westminster, Lord Delamere, Sir P. Egerton, Colonel Egerton Leigh, and Sir R. Cunliffe contributed liberally from their well-known collections.

THOSE who are interested in the ruined cities of Asia Minor, particularly the cities which figure in the early history of the Christian Church, will be glad to learn that a series of seventy-two photographic views of that region, taken by the sapper who accompanied Mr. Wood in his excavations at Ephesus, is now ready for sale at Mr. J. Trotman's, 15, Bury Street, Bloomsbury, London. Single views are sold separately at 1s. each. The following is the distribution of the views:—Smyrna, 12; Ephesus, 35; Magnesia, 1; Tralles, 1; Laodicea, 5; Hierapolis, 7; Philadelphia, 3; Sardis, 4; Thyatira, 1; Pergamus, 4. For pictorial effect, the best, we think, are the views of Sardis (Nos. 50, 60, 62 in the series), strikingly characteristic as they also are of the general features of Asia Minor. Thyatira is also fair (No. 63). Of Ephesus the best views are Nos. 17, 25, 27, 16, and 15. Altogether the series is exceedingly interesting.

THE medal which we described some weeks since (see *ACADEMY*, December 5, 1874) was presented to M. Corot on the 29th ult.

ON the occasion of the visit of Karl Hübner to Boston an exhibition of his works was organised in that city. The members of the Palette Club of New York gave their first art reception of the season recently to a brilliant assembly. The guest of the evening was Professor Carl Hübner, of Düsseldorf, now on a visit to America. The walls were hung with many new and striking works of art by American painters.

AT the sale at the Hôtel Drouot of pictures from the Cercle des Arts, on the 21st and 22nd ult., the following prices were obtained:—Decamps, *The Youthful Giotto drawing in the Campagna*, 610 fr.; Jadin, *Still Life*, 1,700 fr.; Marilhat, *Recollections of the Environs of Beyrouth*, 10,000 fr.; Roqueland,

Camille, *Jean-Jacques Rousseau gathering Cherries*, 6,000 fr.; Decamps, *View taken in Italy*, charcoal, heightened with crayon, 700 fr.; Marschal, *The Little Slayer of Crows*, 1,500 fr. The sale realised 59,000 fr.

IN a sale of Oriental cloisonné enamels of the same date, two blue turquoise elephants sold for 7,000 fr.; a pair of columnar shaped vases, 880 fr.; another pair with aquatic decorations, 675 fr.; an old Oriental green vase, 1,260 fr.; and a celadon, 890 fr.

THE *Moniteur des Arts* states that some interesting archaeological excavations have been made at the Bocenos, near the lines of stones which extend from Kermario to Carnac (Morbihan). The Bocenos consists of thirty mounds, each covering one or more Gallic houses. At the instance of M. du Cleuziou, the distinguished archaeologist and explorer of Gâvr-Innis, the smallest of these mounds has now been opened, and was found to cover a Gallic house of the second century, consisting of three small chambers in front, and a larger square room with two hearths, occupying twice the area of the other three. The ground was spread with mortar, and showed manifest traces of fire. Eight or ten different kinds of bricks were found, serving for the roofing, paving and ornamentation of the house, and from sixty to eighty forms of various potteries, from the primitive pottery of the dolmens to the finer and more graceful examples of purely Gaulish art, indicating an advanced stage of civilisation, which, notwithstanding the Roman occupation, had not succumbed to its influence. Flints were also found, polished celts, a terracotta head of Venus Anadyomene, and a quantity of shells and bones. This discovery is difficult to reconcile with the classification hitherto made of the ages of Stone, Iron, and Bronze, for all these objects have been found in the same place. In making a trench through the mortar, two other layers of burnt remains were found, the one at 30 centimètres, the other at 1 mètre 50 cent. (about 5 feet) below the level of the soil. The earth was mixed with ashes, coal, and even vitrified granite, so great had been the violence of the fire. Beside these excavations, there has been discovered at Mané-Bras at about an hour's distance, a fortified town, with a sacred enclosure and a slope overlaid with stones ranged in a circle. The excavations will be continued during the present year.

SIGNOR FUMAGALLI, of Milan, has left to the Academy of Fine Arts of that city, 80,000 francs, the interest of which is to be applied to giving an annual prize of encouragement to an Italian artist for a work of sculpture or painting.

M. ADOLPHE LANCE, Government architect, has just died at Paris, at the age of sixty-one. He had been charged with the restoration of the Cathedrals of Sens and Soissons, and the Abbey of St. Denis.

THE *Giornale di Napoli* states that the important discovery has been made, near Scafati, at a short distance from the surface, of a Pompeian house in good preservation. It consists of four chambers, the peristyle being not yet uncovered; in one of them is a marble basin and a statue of the same material, representing Flora or Pomona. On the pedestal is the following inscription:—

RURIS FERTILITAS
TU MURUS
AENEUS ESTO.

M. CHARLES CORDIER, says the *Chronique*, has just finished the monument to Christopher Columbus that he was commissioned to execute for Mexico. Beside the principal figure, there are seated at the four angles of the pedestal of this fine monument, which is 12 mètres in height, the figures of four Spanish monks, two Franciscan and two Dominican, who, it is recorded, for once laid aside their usual burning zeal, and actually saved the great discoverer from the horrors of the In-

quisition. One of these monks, Diego de Dieza, is represented as searching in the Scriptures to see whether he can find anything opposed to the existence of the New World; another, Perez de Machena, consults geographic charts, and holds a compass in his hand; a third, Las Casas, is writing a plea for the poor Indians who were destined to be so cruelly treated by the Spaniards; while a fourth holds up the crucifix for these same Indians to worship. Bas-reliefs representing various scenes in the conquest of America ornament the pedestal, and a letter of Columbus is engraved on its black marble. Altogether the monument is said to have great artistic as well as historic interest. It will be exhibited for some time in Paris in the middle of the Place du Carrousel before it is sent to Mexico. It is a gift from M. Antoine Escaudon to that State.

WE understand that one of the principal motives for delaying the festival of the Michel Angelo Centenary is the fact that the colossal statue of David, that, as before stated in the *ACADEMY*, has been removed from its original position in front of the Palazzo Vecchio, at Florence, is only now in course of re-erection at the Academy of Fine Arts, and cannot possibly be finished by next March. "The erection of this David," writes Grimm, "was like an occurrence in nature from which people are wont to reckon. As a Florentine, I should not myself be free from the superstition that to move its position would be an evil omen." Nevertheless, it was decided three years ago by competent judges that the statue would certainly be in danger if left any longer exposed to the action of rain and frost. A suspicious crack had appeared in the trunk or stem of the tree which, as usual in sculpture, supported the leg on which the statue is poised, and added to this, a gargoyle from the roof discharged water full upon it. One would have thought that the latter evil would have been more easily remedied by the removal of the gargoyle than the statue, but the latter was deemed necessary, and the only question was where it should be set up again. Its present erection, at the Accademia delle Belle Arti, fails to give universal satisfaction. Mr. Heath Wilson writes to us from Florence:—

"An ornament of Florence has been taken away, and is shut up in a place which is too small for it, and where it cannot possibly be seen well, as will be discovered when it is exhibited. A public statue, associated as this is with the national history and life of Florence, ought not to have been removed to the rooms of any association, however useful or patriotic. An Academy represents only a section of the citizens, and that a small one, and one not always influenced by broad and generous views. It would have been easy to place this grand work, not only where it could have been well seen, but where it would still have remained above all things Florentine, and representative as of old of the courage and freedom of the Republic. A more miserable and blameworthy error of judgment could not have been committed, and all the honour paid to Michel Angelo will be neutralised by the dishonour done to his noble production in thus shutting it up and allowing it to become, as it were, the property of what is in reality a private association."

The probable injury to the David by exposure was foreseen as long ago as 1503, when Giuliano da Sangallo, one of the council of artists that met to consider the site for its erection, advised that it should be placed in the middle arch of the Loggia dei Signori, in order to afford it some protection. His opinion was, however, overruled. The Grand Duke has lately had a fine cast in bronze taken of it, which it was presumed would occupy the place of the original marble statue, but such is not the case. It has been set up on the Piazza Michel Angelo, near San Miniato.

THERE is now on exhibition at Leavitt's Art Gallery, New York, an unusually fine collection of statuary, which is announced for sale at an early day. One of the most striking pieces of work is Mr. Wood's *Song of the Shirt*, which in the utter dejection of spirit, as shown in the

drooping form, and the want and privation depicted in the pinched features, tells as eloquent a tale of woman's sufferings as the pathetic words of Tom Hood. A medallion entitled *Early Sorrow* and a bust of *Sappho* by R. H. Park, a charming little piece, *Sans Souci* by Mr. Ives, *Victory* by Rauch, are among the most noticeable in the collection.

THE will of the artist William B. Rinehart, of Baltimore, who died recently at Rome, directs that his remains shall be removed to Baltimore for interment. He bequeathed 2,000 dollars to each of his brothers, and the balance of his estate, about 50,000 dollars, to executors to be applied by them to the promotion and cultivation of art.

M. CHARLES BLANC, the art critic of the *Temps*, the commentator on Rembrandt's etchings, and author of numberless contributions to art-criticism, makes, in the course of a recent article on French engraving, some remarks on how to frame the prints with which most people's walls are more or less adorned. M. Blanc cannot say too much against the modern fashion of exposing to view an immense margin of white cardboard all round the picture. He reminds us that old-fashioned amateurs used to frame their Nanteuils, their Callots, their Rembrandts, quite closely, like a painting. He does not quite recommend this, however. But it is very well to mention what every observant person knows and sometimes forgets—that the white light of a broad white margin kills the high lights of the print itself. This is so in England; still more of course, in France, for what is grey here looks brilliant there, and whoever would frame prints to look well in a French room must mount them with mounts very low in tone. In England, the faintest rough grey paper or faintest rough buff paper, such as Whatman's, is the best. A fairly broad mount is then not only allowable, but advisable, though the modern fashion errs on the side of excess. As to frames, the golden rule is surely to choose the frame which will least of all attract the eye. Black wooden frames are, of course, at once sober and decorative in their general effect, but if placed close to the picture they are perhaps too apt to catch the eye. The thin frame of plain oak, unpolished, is of all the least obtrusive. No one who has noticed how by an inappropriate frame you may make a good print look almost a bad one, and, by an appropriate, a tolerable print look almost a very good one, will begrudge a few minutes given to this subject of framing.

THE STAGE.

"MONEY."

THEY gave us a refreshing performance at the Gaiety Theatre, on Saturday—a performance of *Money*: almost the best, if not quite the best, of Lord Lytton's several plays. Its story is too well known for us to need to repeat it. In the treatment of its main theme, *Money* shows a cynicism rather exaggerated and histrionic. It was found piquant at once, successful and fashionable, and so gave birth in the natural course of things to the cheap cynicism of recent and less substantial work. And if stage cynicism came in with *Money*, as I suppose it did, stage sentiment, which had had its day already, almost went out with it. Not that the sentiment itself in *Money* is false, or that there is really too much of it, but that its expression is rather over-charged. We have in it the last echo of the kind of talk that Falkland talked to Julia in *The Rivals*—the day of annuals was hardly past, and the polite world expressed itself with perfect propriety and made love in rounded periods—not broken phrases.

But the merit of *Money* is not in its combination of the fag end of sentiment with the beginning of cynicism. The merit of *Money* is in a plot at once firm, lucid, and interesting: in dialogue of comedy always polished, generally

witty; and in character-drawing that is sharp, decisive, penetrating—almost original. We do not nowadays do justice to the freshness of Lord Lytton's comedy characters. We have seen too many unacknowledged reproductions of them to believe that they were ever studied from the life—that they were ever anything but humorous fancies. But compare Sir Frederick Blount, Lord Glossmore, Captain Dudley Smooth with a famous contemporary of theirs—Lord Frederick Verisopht in *Nicholas Nickleby*—and you will see that for once the genius of Dickens has served him less well than the talent of Lytton. These men of the world whom you meet in *Money* are far less exaggerated than Dickens's silly peer; they were sketched by one who knew them better, and who observed such types calmly—with no fatal earnestness or fatal zeal. Sir Frederick, Lord Glossmore, Captain Dudley Smooth, were men Lord Lytton met every day in Saint James's Street, one generation ago. It was in the reign of "dandies," not "swells." The manners of the "finest gentleman in Europe" were not quite forgotten nor out of date. You may see some of these people in Maclise's caricatures. But Lord Lytton drew them more tolerantly.

The performance of *Money* at the Gaiety was sound, but not brilliant. Mr. Vezin brought to the representation of the hero that bitter intensity which he often makes effective, but which sits ill, I think, upon a man who has really no reason to think the worst of all mankind, when one fellow-creature appears to have jilted him, while another has left him his fortune. Cynical, of course, Alfred Evelyn must be, when he is not sentimental instead, but he might conceivably be more lightly cynical: not so oppressively bitter and reproachfully morose. Mr. Vezin speaks his passionate scenes too loudly: he declaims them too much like a recitative. But his impersonation is never weak, either mentally or physically, and of course never careless and ill-studied. It is hearty and manly, but, to me, in this case wholly without charm. Why will he not give us something as good as his Scotch poet in the *Man o' Airlie*? There was manly tenderness enough in that, and a charm one does not forget.

Clara Douglas, the generous heroine, who, through a misconception, appears throughout the piece as the victim of disappointed love, has a good but rather monotonous part—a part unrelieved by gleams of light and happiness, but very effective for an actress who is strong and subtle enough to be varied within limited range. By all but the highest actresses the part is in danger of being played too uniformly. It wants imagination to put a feverish anxiety into the seemingly insignificant flirtation which, for a purpose of her own, she carries on with Sir Frederick, and a quiet intensity, an emotion in reticence, in the later scenes—the one, for example, where she bids good-bye to Evelyn. Miss Rose Leclercq is a sympathetic actress, with a voice like Anne Page's, but with too little variety, too little significance, in delivery, as in gesture. Miss Furtado is also a sympathetic comedian, obliged to make Georgina Vesey a much pleasanter person than one thinks she was meant to be—but for such a failing no reasonable audience will ever be very hard on her. Mrs. John Wood's Lady Franklin was very vigorous and spirited: a little noisy and hard, indeed, in certain scenes in which she need not be prominent, but carrying off with most unquestionable success her famous scene with Graves, when Graves is betrayed into hilarity.

As Captain Dudley Smooth, a bachelor of twenty years' experience, whom it is no longer possible to surprise—for whom there are no things whatever in Heaven and Earth unprovided for in his philosophy—Mr. Belford is seen to the very greatest advantage. Mr. Righton's Stout is in person none other than the Mr. Funnival of *Two Roses*, save that he has lost his geniality, and with it his integrity. But outwardly he is the same able and energetic and fussy lawyer, easily astounded, but

with difficulty deceived. As Sir John Vesey—Georgina's father—Mr. Maclean was over-fidgetty and restless. Had Sir John no manner of the old *régime*? But of the purely comic side of the character, Mr. Maclean was fully sensible. Graves, with his grumbling, his melancholy references to the "departed," his substantial appreciation of the good things of the world, and his sudden attack of cheerfulness—surprising to himself and his friends—is a character it is not easy to make natural, though it will set on any quantity of barren spectators to laugh. It was not observed from nature, but invented for stage effectiveness. It was discreetly played by Mr. Taylor. Mr. Forbes-Robertson, the representative of Lord Glossmore, seemed in critical moments to see the point of the character; but his execution was faulty—his bearing mannered and stiff. The performance, then, as a whole, was not brilliant, but it was in the main creditable and refreshing. And in the midst of much of trifling and buffoonery, one is thankful for the presentation of a good literary work which at all events in our generation is hardly likely to die.

FREDERICK WEDMORE.

Our Boys—Mr. Byron's comedy for the Vaudeville—will be played for the first time at the end of January. The rehearsals are, we hear, proceeding.

MISS CAVENDISH returns to the London stage to-day, in her favourite character of the "New Magdalen" at the Charing Cross Theatre.

FOR this evening *Madame Angot* is announced at the Philharmonic in place of *Giroflé-Girofla*.

THE Alhambra performance of *Whittington*, briefly mentioned in our last, is by no means so remarkable for the specially composed music of Offenbach—too much of which suggests something or other written by him within the last ten years—as for the dresses which Mr. Alfred Thompson has designed for the ballet in the second act.

MR. EDWARD HASTINGS, of the Prince of Wales's Theatre, organised a performance at the Vaudeville last Saturday afternoon: the piece given being a new one, called *Stage Land*, by a new writer—Mr. G. R. Douglas. The principal parts were carefully and diligently played, by Mr. Lin Rayne, Mr. Vyner Robertson, Mr. W. H. Stephens, Mr. Collette, Mr. Atkins, Miss A. Wilton, and Miss Eleanor Bufton. The first act—notwithstanding the proof it affords of the author's want of the *habitude de la scène*—is perhaps the most interesting. The piece seems somewhat mis-named, the stage land hinted at not being described or exhibited with any peculiar truth. The hero takes to the profession, it is true, but it appears to be rather his poverty than his profession that bars the way to an early and successful love affair. The young man accepts the father's refusal, and anticipates that of the young woman, which need not, after all, have been finally given. The two separate, to meet again three years afterwards at the house of one Sir Harold Trefusis, who is getting up private theatricals in which Miss Hepburn—the heroine—is to act, and which, by a coincidence, Maurice Hamilton, or "Lawler," the young comedian, is to superintend. At Almahurst, Sir Harold Trefusis's place, there are gathered various amateurs, whom the author has done his best to individualise, even at the risk of making them entirely eccentric, as even at the same risk the most successful French writers of comedy have made a point of doing even with the least important of their characters. These people are possibly more interesting to watch than the development of the story itself; but however that may be, Mr. Douglas's work is a work of some promise.

MR. BYRON's well-known drama of *The Lancashire Lass* is in active preparation at the Princess's Theatre.

THE Pantomimes have been drawing better houses this week, and may be said to be settling down for a successful month or two. One night last week, during the arctic weather, there were just six people in the stalls of a leading theatre.

Blue Beard—the burlesque turned pantomime, likely to be played for many a night at the Globe Theatre—is certainly the most striking thing of its kind seen in London for many years. There is in it so much of what if we wished to write French we should call *entrain*, or, wishing to be English—"go." Miss Lydia Thompson is in capital form, both as actress and singer; Mr. Lionel Brough is exceptionally funny, and Miss Sanger is spirited; while no keen critic would be needed to discover the excellent qualities in Miss Emily Duncan and Miss Inez d'Aguilar. Solos and choruses are well enough sung—the music is pretty to begin with—and the stage, brilliantly lighted, presents a remarkable picture. In the whole performance the *Roll-Call* is the only serious mistake. Of course in such a thing as *Blue Beard* the author must expect to be thought of the last. Yet, even under these conditions, Mr. Farnie has been prodigal of gifts. He has been often amusing—sometimes witty.

M. FRANCISQUE SARCEY has contributed to our stock of useful knowledge—in England, he writes, "the theatre is the diversion of the lower orders." Ten years ago, in the reign of sensation drama, that was partially true, but it has no truth whatever just now, when in the first place the success of theatres of comedy, like the Vaudeville, the Gaiety, and the Prince of Wales's, and of a theatre for the poetical drama, like the Lyceum, is ensured by the attendance of people for the most part educated and cultivated at least in some degree. Again, the supporters of opera-bouffe—so terribly the vogue—are by no means among the *classes basses* of our society. For these, opera-bouffe is far too dainty an entertainment. For the really full appreciation of opera bouffe, three things are required—riches, indolence, and too much dinner.

M. JULES BONNASSIES, in the current number of *Le Théâtre*, is unduly hard upon Mdlle. Sarah Bernhardt when he says that she seems to him not to have studied sufficiently that rôle of Phèdre which she has courageously undertaken. But in another passage he appreciates with the power of a serious critic, and the elegance of an accomplished writer, certain characteristics of Mdlle. Bernhardt's art. This passage we make no apology for quoting:—"Ce qui lui appartient," à Mdlle. Bernhardt, "dans l'œuvre Racine," he says, "ce sont les personnages tendres et émus que le cygne de la Ferté-Milon a musiqués dans la mode mineure de la passion; le timbre mélodieux de sa voix, ses beaux yeux mourants, la langueur habituelle de son attitude, en un mot l'ensemble de son physique préraphaélite, la destinent à ces rôles élégiaques. Mais les caractères dont Racine a puisé les éléments chez les pamphletaires romains, comme Agrippine, ou dans les tragiques grecs, ne seront jamais bien exprimés par Mdlle. Bernhardt. Phèdre est, je crois, le personnage pour lequel Racine s'est le plus inspiré des Grecs. C'est également celui qui a le plus exercé la plume des critiques, en Allemagne et en France, aux deux derniers siècles; et en celui-ci. Quelques uns ont dit que les remords de la reine incestueuse sont, chez le poète, une inspiration du sentiment chrétien; mais tous ont dû reconnaître que la doctrine, tout grecque, de la fatalité plane sur Phèdre, sur le crime qu'elle commet et qu'elle continue de commettre, malgré ses remords. Je crois aussi à cette dualité d'éléments dans l'œuvre de Racine; mais l'élément grec y étant primordial, doit évidemment déterminer la plastique du rôle."

MDME. CHAUMONT, famous for delicate art in indelicate subjects—for *Toto chez Tata*, for *Madame attend Monsieur*—is about to appear at Nice, where she will act for the first time in a

new piece by Gaston Jolivet, called *Suivez-moi, Tricoche*!

THE *Temps*, in reconciling M. Sardou to the indifference of the public to his drama *La Haine*, and to the severity of certain critics who had a right to treat him as one from whom good work was to be expected—regrets the continued run of *Le Tour du Monde* at the Porte Saint-Martin, not because the thing is a bad thing of its kind—which it is not—but because it keeps fine talent so inadequately employed. "My heart is bleeding," writes the critic of the *Temps*—his devotion to the art of the theatre is absolutely genuine—"Le cœur me saigne quand je songe que Dumaine se promène à travers des trucs; que Mdlle. Patry, cette grande espérance, use sa jeunesse, ses forces et un talent plein d'avenir, à monter dans des locomotives en carton et à se sauver devant des serpents en baudruche. Quel malheur pour elle, qui avait si brillamment débuté dans Marie Tudor et dans Dona Florinde! et quel malheur pour le drame! il n'y aura plus d'artiste dans dix ans, s'il ne s'en forme plus à cette heure!"

MUSIC.

WE understand that the concerts at the Royal Albert Hall are to be resumed on the 19th inst. In future, however, they will only be given twice a week, one evening being devoted to oratorios, and the other to miscellaneous music.

SOME of our readers will probably be aware that Herr C. F. Pohl, of Vienna, has for some years been engaged upon an elaborate and exhaustive work on the life and compositions of Joseph Haydn. We are able to state, on the authority of a letter written by him to a friend in London, that the book is now in so forward a state that a portion of it is already in the hands of the printers.

THE opening of the New Opera House at Paris took place on Tuesday last. The Government had engaged the entire house for the opening night, which was, therefore, a state festivity, to which the diplomatic corps, the deputies, &c., were invited. The regular performances were to commence last evening with *Hamlet*. A fine organ with two manuals and eighteen stops has been erected behind the stage by the eminent firm of Cavallé-Coll.

BERLIOZ's *La Damnation de Faust* has lately been given at the Concerts du Conservatoire at Paris with great success.

THE public library of the town of Bergamo has lately been enriched by a collection of numerous scores, printed and manuscript, which formerly belonged to the late composer Simon Mayer. The volumes, about 1,500 in number, are the gift of M. Massinelli, son-in-law of the composer. Mayer, a Bavarian by birth, passed the greater part of his life at Bergamo, where he died in 1845. Donizetti was one of his pupils.

For the benefit of the Pension fund of the Vienna Imperial Opera, two Christmas performances were given, which must have greatly interested the amateurs of that city. On December 22, Byron's *Manfred* with Schumann's music was given at the Opera house, and on the 26th the programme consisted of the first act of Spohr's *Jessonda*, a fragment from Halévy's *L'Eclair*, the grand finale from Mozart's *La Clemenza di Tito*, and the fourth act of Donizetti's *La Favorita*. Schumann's *Manfred* music was, on this occasion, performed for the first time, and an immense success achieved. The performance, under the bâton of Johann Ritter von Herbeck, the director, who on this occasion made his first appearance at the conductor's desk after a long interval, was perfect throughout, and left nothing to be desired. Lewinsky played

Manfred with great mastery, and the greatest artists of the Opera took the small and indifferent parts. The performance on the 25th was not so impressive, because all the fragments, with the exception of the fourth act of *La Favorita*, were performed in evening dress, and with the music in the hands of the singers. Mesdames Wilt (Vilda) Dustmann, Friedrich-Materna and Gindele, and Herren Walter and Rokitsky, however, produced a great effect, and Mdlle. Pauline Lucca, assisted by the last-named gentleman and Herr Adams, was highly successful in the last act of *La Favorita*, which was performed in costume and with all theatrical accessories.

DR. EDUARD HANSLICK has just published, at the Berlin "Verein für Deutsche Literatur," an elaborate work entitled *Die Moderne Oper*.

THE San Francisco correspondent of the *North China Daily News* states that Mdlle. Anna Bishop, notwithstanding her great age, has been delighting the public by her concerts in that city. Her voice, he says, seems to be little impaired by time, and her appearance gives one the idea of a far younger woman.

THE ROYAL INFIRMARY for CHILDREN

and WOMEN, WATERLOO BRIDGE ROAD, S.E., for the Treatment specially of Children's Diseases, founded 1810. *Patrons*—Her Majesty the Queen; H.R.H. the Prince of Wales; H.R.H. the Prince of Wales; *Treasurer*—John F. Eastwood, Esq., Escher Lodge, Escher, Committee—Sir J. C. Lawrence, Bart., M.P.; Rev. H. W. Batesman, Rev. F. Tugwell, Mr. H. Akerman, Mr. F. L. Bevan, Mr. E. Canton, Dr. A. Farr, Mr. G. Hill, Mr. J. McGaw, Mr. J. Mills, Mr. T. Mitchell, Mr. Oppenheimer, Mr. F. W. Reynell, Mr. F. Scarrow, Mr. J. W. Simmonds, Mr. J. W. Stratton, Mr. W. G. Trewby, Mr. C. White, Mr. R. B. Wilson. *Chaplain*—Rev. F. Tugwell. *Secretary*—Mr. William Champion. *Bankers*—Messrs. Fuller, Banbury & Co., 77 Lombard Street, E.C.; Messrs. Coutts & Co., 59 Strand, W.C.

APPEAL.—The Committee most earnestly commend the work of this Hospital to the sympathy and help of all who can feel for the destitute and suffering. The claims of this Institution for support rest on the following facts: That it is the oldest of its kind in the metropolis, and has suggested more than one such Hospital. That it has relieved upwards of 350,000 patients—curing and comforting a multitude of helpless little ones. That it is situated in one of the most densely populated districts of the metropolis. But that it receives patients from any quarter—even from the country. That it is capable of extension, and so of increased usefulness, which the Committee are very desirous to accomplish, if funds are placed at their disposal. That the present income is quite inadequate to meet the present demands—a cause of much anxiety, arising partly from the absence of wealthy residents in the vicinity of the Hospital. The Committee, therefore, urge these claims especially upon the attention of the rich, who are asked to give "out of their abundance," but feeling sure that all who know the value of comfort and attention in sickness will gladly respond to this appeal for the "sick children."

Contributions (especially Annual Subscriptions) will be most thankfully received by the Treasurer or the Bankers, or at the Infirmary.

WILLIAM CHAMPION, Secretary.

* * * Post Office Orders may be drawn on the General Post Office. Both Orders and Cheques should be crossed for safety. An Annual Subscriber of One Guinea, or a Donor of Ten Guineas, may always have two Out-patients on the Books, and so on in proportion to the amount of contribution. Presents of worn-out Linen, Children's Clothing, Children's Books, and Toys are most acceptable. The Hospital is open daily for public inspection.

PENNSYLVANIA RAILROAD COMPANY

SIX PER CENT. STERLING CONSOLIDATED MORTGAGE SINKING FUND BONDS.

Principal redeemable July 1, 1905; Coupons payable January 1 and July 1; both in London.

Second Issue, £3,000,000 sterling, in 15,000 Bonds of £200 each. Price of Issue, £90 per cent., or £180 per Bond, if paid in full on Allotment; or 91 per cent., or £182 per Bond, if paid in instalments.

THE Pennsylvania Railroad Company's Second Mortgage Sterling Bonds, maturing March 31, 1875, will be received in payment for this issue at par, in cash, with accrued interest added to date of payment.

The London, Asiatic, and American Company (Limited), Agents for the Pennsylvania Railroad Company, are authorised to offer for public subscription 3,000,000. sterling of Consolidated Mortgage Sinking Fund Bonds.

These bonds form part of a total of \$100,000,000 (20,000,000. sterling), secured by a mortgage, dated July 1, 1873, which covers all the property and franchises of the Pennsylvania Railroad Company, including their main line from Philadelphia to Pittsburgh, and gives a first charge on their leasehold interest in other lines and in canals, and on their large investments in shares and bonds of other companies.

These shares and bonds last mentioned were valued by the officers of the Company in 1873 at \$50,000,000, and by a re-valuation in 1874 by a Committee appointed to examine all the assets and liabilities of the Company, that valuation was reduced in a spirit of extreme caution, as stated by them, to \$49,711,000.

On the other hand, however, the same Committee estimated carefully in detail the actual construction, value, and cash value of the Company's own lines, rolling stock, and real estate, at \$45,826,675 65c. more than they stand as costing in the capital account in the Company's books.

The mortgage provides that no greater amount of bonds can be issued at any one time than shall be equal to the amount of the paid-up outstanding ordinary stock, which amount, on the first day of November last, was \$68,702,437 50c., or about 13,740,000. sterling. This, therefore, is the present limit of issue. But it is also provided that such an amount of the bonds shall be reserved as will be equal to the amount of the existing prior mortgage bonds of the Company, and their debt due to the State of Pennsylvania; these altogether amount at this time to \$34,763,600, or about 6,952,720. sterling, of which, however, \$4,865,840, or about 1,000,000. sterling, mature on the 31st of March next, and will be paid off out of the proceeds of the present issue.

The sum of \$10,000,000, or 2,000,000. sterling, was negotiated in 1873.

Of the total available amount of bonds which can be issued against the present stock capital of like amount, viz.	\$68,702,000
The portion that must be reserved against prior mortgage bonds (omitting the second mortgage, which is about to be paid off) is	\$24,689,000
And against the debt due to the State	5,209,000
And the amount issued in 1873 was	10,000,000
	<hr/>
	\$39,808,000
Leaving as the total amount the Company has now the power to deal with, including the bonds now offered.	\$28,804,000
	or about £5,760,000

The letter of the President which accompanies the prospectus furnishes a summary of the properties on which the bonds are secured, amounting to \$144,965,500, and also an account of the Company's total bonds and debts, amounting to \$53,313,810, or about £10,662,000, excluding the present issue, showing a surplus of security of \$91,651,690.

The gross revenue of the Company from all its operations east of Pittsburgh rose from \$10,304,290 in 1862 to \$39,983,000 in 1873. It was less for 1874, in consequence of the depression of trade, but the net revenue for twelve months to December 31, 1874 (December being estimated), is \$900,000 increase over that of 1873, and is abundant to pay the usual 10 per cent. dividend on the present share capital of \$68,702,000, or 13,740,000., after providing for all interest on bonds and guaranteed dividends on stock of the United Companies of New Jersey, &c.

A large saving in working expenses was made in 1874, and a considerable part of it is due to the recent improvements and facilities along the Company's

whole system, and the proceeds of the issue now offered for subscription, after providing for the Second Mortgage Bonds, due March 31 next, are to be appropriated to like purposes, and therefore to the improvement and value of the security.

Under a provision in the mortgage a sinking fund of 1 per cent. per annum will be founded, to commence in 1879, for the redemption of the bonds, by purchasing them in the market so long as they can be bought at or under par, or by investing in other securities when such purchase is impracticable.

The price of issue is 90. per cent., or 180. per bond of 200., if paid up in full on allotment; or 91. per cent., or 182. per bond of 200., if paid in instalments as follows:—

10. per cent., or 20. per bond of 200. on allotment.	
25 " 50 " " February 15, 1875.	
25 " 50 " " March 17, "	
31 " 62 " " April 30, "	
91. 182. per bond.	

Instalments may be paid in advance on allotment, or on either of the above dates, under discount at the rate of 5. per cent. per annum.

The failure to pay any instalment when due forfeits all previous payments. The bonds will carry interest from January 1, the first coupon being payable July 1, 1875.

The Pennsylvania Railroad Company's Second Mortgage Sterling Bonds, maturing March 31, 1875, will be received in payment for this issue at par, in cash, with accrued interest added to date of payment.

The bonds will be issued to bearer, but they may at any time be registered in the holders' names, transferable only on the Company's books, at the Agency in London, and may again be taken off the register, and made to resume the condition of bonds to bearer.

Copies of the prospectus (with form of application), and of the President's statement, can be procured at the offices of the London, Asiatic, and American Company (Limited), No. 26, Old Broad Street; or of the Brokers, Messrs. Foster & Braithwaite, 27 Austinfriars, E.C.; and Messrs. Heseltine, Powell & Co., 6A Austinfriars, E.C.

The subscription list will be opened on Wednesday, the 6th instant, and will be closed on or before Thursday, the 7th instant, at four o'clock p.m.

London, January, 1875.

Pennsylvania Railroad Company Six Per Cent. Sterling Consolidated Mortgage Sinking Fund Bonds.

To the London, Asiatic, and American Company (Limited), London.

Gentlemen,— request that you will allot to bonds of £200 each (£) in the above-named issue, and engage to accept that, or any less number that may be allotted, and to pay for the same, in conformity with the terms of the prospectus.

LITERATURE.

Examen des Trois Règles de Droit International proposées dans le Traité de Washington. Mémoire présenté à l'Institut de Droit International (session de Genève, 1874) par M. Charles Calvo, Membre effectif de l'Institut et Membre effectif de la Seconde Commission.

THE author of the memoir which forms the subject of these remarks is well known in Europe as an international jurist of distinction, whose writings are, beside their other merits, especially commendable for the ease with which he assimilates, and the skill with which he presents, a vast amount of materials, the fruit of wide and diversified research. Clear in exposition, and elegant in style, M. Calvo is one of the few writers on International Law who understand the art of not making an enemy of the ordinary reader, and he is widely read. The honourable President of the Geneva Tribunal of Arbitration awards to him the praise of having traced in advance "la ligne sur laquelle, après un mûr examen des faits les plus compliqués, nous nous sommes rencontrés;" and if M. Adolphe Franck blames him for showing too much regard "aux idées communément reçues et à la doctrine des faits accomplis," the criticism conveys a compliment to those whose business lies in the practical sphere of International Law, which is not what an Institute of professors, however learned, may decide that nations ought to do, but what they have done hitherto.

The present memoir, which M. Calvo has republished from the *Revue de Droit International*, deals with the Three Rules of the Treaty of Washington. It traces their origin in the facts which gave rise to, and the negotiations which preceded, their adoption by the Governments of Great Britain and the United States; investigates their historical antecedents in the general principles of neutrality, in the municipal laws of different countries and their practical enforcement; compares them with the opinions of publicists; and in conclusion proposes to support them and extend their application by a general treaty or declaration which should, amongst other things, assert the inviolability of private property at sea, and make it obligatory for neutral States to prevent the trade by their subjects in contraband of war. That M. Calvo, to say the least, aims at high speculative results, can certainly not be denied, but we must admit that his treatment of the subject is in form historical. His conception of its scope is thus stated at the outset of the memoir:—

"Que sont ces trois règles? Qu'est-ce qui en a

amené la proclamation? Constituent-elles une innovation dans le droit des gens, ou ne sont-elles qu'une consécration nouvelle donnée à des pratiques antérieures? Ont-elles un caractère de généralité qui les rende obligatoires pour tous; ou sont-elles renfermées dans des limites qui n'en font encore qu'un lien entre les deux Etats qui se les sont appropriées? Reposent-elles sur des précédents historiques et trouvent-elles déjà leur sanction pratique ou morale soit dans le droit public, soit dans l'opinion des publicistes? Enfin, dans la forme sous laquelle l'Angleterre et les Etats Unis se proposent d'en suggérer l'adoption aux autres nations, constituent-elles un progrès, une conquête véritable du droit des gens, ou bien ont-elles besoin d'un complément indispensable pour produire les résultats considérables que les cabinets de Londres et de Washington se sont flattés d'y attacher? Tels sont les points, telles sont les diverses faces de la question que nous allons successivement aborder."

This is followed by a short *énoncé* of the facts which gave rise during the Civil War to the grievances alleged against Great Britain by the United States, and of the successive phases of the diplomatic controversy and negotiations which led ultimately to the Treaty of Washington. The facts are compiled from the abundant materials supplied in the cases, counter-cases, and arguments submitted on behalf of the respective Governments to the Tribunal of Arbitration, and summed up in a judgment which will be handed down to posterity as a model of eloquence and jurisprudence,—I mean the statement annexed to the last Protocol of that tribunal, under the title of "Sir A. Cockburn's Reasons for dissenting from the Award." M. Calvo lays special stress on the inefficiency of the British law for the maintenance of neutrality commonly known as the Foreign Enlistment Act of 1829, and he points out that the judicial construction which it received in the case of the *Alexandra* resulted in a "quasi-impunity," which enabled the Confederate agent Bullock to procure and equip vessels of war for the Southern States at Liverpool and elsewhere. This might lead one to suppose that the gravest and most frequent infringements of British neutrality occurred during the latter period of the war as a consequence of the judicial decision in the case of the *Alexandra*, which did not arise till 1863. Now the only two vessels out of three, in respect of the equipment of which the British Government was found wanting in "due diligence" by the Award of the arbitrators—the *Florida*, originally known as the *Oreto*, and the *Alabama*—sailed from Liverpool, the former in March, and the latter in July, 1862; and a memoir* submitted by the United States to the French tribunals in the "affaire Arman" openly admits that the measures taken by the British Government after the escape of the *Alabama* in 1862, obliged the Confederates to shift the scene of their operations and "seek in France for the market which began to fail them on the other side of the Channel."

Several pages of M. Calvo's memoir are devoted to an analysis of the Treaty, and the Award of the majority of the arbitrators. He quotes at length the masterly introduction to Sir A. Cockburn's judgment, in which the Lord Chief Justice has placed on

record his view of the general principles of law applicable to the case, and to the special question of "due diligence" left undefined by the framers of the Treaty. M. Calvo calls attention to the fact that the only dissenting judge was the one appointed by the Queen of Great Britain, and he says:—

"Un des principaux arguments mis en avant par le dissident consiste dans les entraves apportées à la liberté de jugement des arbitres par les règles que leur avait imposées le traité de Washington."

Now, such a statement, if not properly qualified, might lead one to suppose that the Lord Chief Justice grounded his dissent from the Award on his objections to the Rules; but these he explicitly accepts as binding on his own and his colleagues' judgment in the decision of the case:—

"Though of opinion that her Majesty's Government were quite right in saying that the rules laid down by the Treaty are not such as International Law would have prescribed at the time these claims arose, I agree that we are bound by the rules, and that it is our duty to give full effect to them in dealing with these claims."*

Sir A. Cockburn separates the questions which are to be decided according to the rules of the Treaty, and those for which the Treaty had supplied no principles of decision; amongst others, the all-important question of "due diligence," of the legal effect of commissions granted to Confederate cruisers, and of supplies of coal in neutral ports. These were points undetermined by the Rules, and which each member of the Tribunal had to decide according to the "general principles of International Law" so far as they were consistent with the principles of the Treaty, but without its guidance. Sir A. Cockburn's dissent was chiefly grounded on the views of International Law adopted by the majority of his colleagues—a majority composed of dissentient elements, and which sacrificed consistency to the appearance of unanimity by expressing collective opinions in the Award which it would be hard to reconcile with some of the individual opinions put forward in separate papers by each member of the Tribunal.

M. Calvo concludes his analysis of the Treaty and the Award by the following remarks:—

"Certains esprits semblent encore mettre en doute le caractère immanent et général, comme partie essentielle du droit des gens, des règles et des principes qui ont servi de base à la décision solennelle du tribunal arbitral de Genève. Au lieu d'y voir l'affirmation de principes constamment et universellement en vigueur, surtout depuis que la neutralité, avec ses droits et ses devoirs, a été admise comme le fondement des relations réciproques des nations en temps de guerre, on semble les envisager comme une innovation dans les lois internationales préexistantes, consentie exclusivement pour le cas auquel ils ont été appliqués, comme un précédent n'ayant qu'une valeur accidentelle et sans portée pour l'avenir."

And he certainly produces a great deal of authority in favour of his view that the Three Rules constitute no innovation in International Law. I have reason to believe that some of our most authorised jurists would not disagree with him in substance. Yet it is clear that the framers of the Treaty

* *Mémoire pour les Etats Unis d'Amérique* (Paris, 1863), page 4.

* Page 31.

on both sides were conscious of innovating in some respect on previous international practice; or else, why should they have provided that the "general principles" of public law should not be construed in any sense inconsistent with the Rules, instead of providing that the Rules should not be construed in any sense inconsistent with the "general principles" of public law? And, indeed, it cannot be doubted that the words "specially adapted in part or in whole" of the first Rule extend the measure of neutral obligation from cases in which a vessel intended for the service of a belligerent is equipped and made ready for hostilities before departure to those in which she leaves the neutral port without her guns, men, or stores, but has her equipment completed afterwards from the neutral country under previously concerted arrangements. M. Calvo points out, and very justly too, that this extension of the obligation is a necessary consequence of the facilities which steam navigation affords for bringing together the component parts of a hostile expedition. But in making the Rule retrospective, it should have been remembered that the new conditions of this special kind of maritime warfare had not yet been practically illustrated when the *Alabama* sailed from Liverpool.

While giving his general approbation to the Three Rules, M. Calvo holds them to be insufficient in themselves for the purpose for which they were intended, unless supplemented by a declaration of the inviolability of private property at sea:—

"Il faut remonter à la source du mal et en prévenir le développement à son origine même. . . . Nous croyons donc que le moyen le plus efficace pour porter remède au mal, ce serait de faire entrer dans la pratique unanime et définitive des nations l'abolition de la course, et l'interdiction du commerce de la contrebande de guerre—mesures qu'avait déjà recommandées, à la suite de la guerre d'Orient, les plénipotentiaires des grandes puissances réunis en Congrès à Paris—mais en les complétant par l'adoption d'un principe qui en est, à nos yeux, le fondement en même temps que la garantie, et que les Etats Unis avaient posé comme condition de leur acquiescement à la déclaration du 16 Avril, 1856. Nous voulons parler du principe de l'inviolabilité de la propriété privée sur mer en temps de guerre."

No doubt this would be an excellent reform if war itself could be abolished. But never have we been farther from the millennium than in this nineteenth century of ours, when the whole able-bodied population of Europe is condemned to indiscriminate slaughter by the ambition of the great military monarchies. Maritime war would cease to have an object if the enemy's commerce were placed under the protection of the principle of inviolability, and military power would reign uncontrolled. It is not to be supposed that maritime nations will disarm, especially since the discussions of the Brussels Conference have thrown such light on the designs of their military rivals. M. Calvo attempts, indeed, to find historical precedent in the conduct observed by different States, but he does not show that any one great maritime power ever waived the right to seize enemy's goods at sea when it had the opportunity of exercising it. The United States have not even ad-

hered to the Declaration of Paris, which professed to abolish privateering; and if they did not issue letters of marque during the Civil War, M. Calvo himself informs us of the reason when he says:—

"Ce n'est pas que le gouvernement de Washington eût changé d'opinion; mais il craignait de paraître, en le faisant, accorder aux insurgés du Sud le caractère de belligérants et reconnaître leur indépendance comme nation."

France did certainly not waive the right of seizing private property at sea during the late war, and if the Prussian Government enjoined its naval officers to abstain from such seizures, the injunction was superfluous, considering that the Prussian navy was a prisoner in its own ports during the whole time of the war. England will certainly follow the traditional course of her maritime history, and indeed it is much more likely that she will reconsider the Declaration of Paris than accede to any new proposal for curtailing her power at sea. The Brussels Conference, and the one that Russia now proposes to convocate at St. Petersburg, have revived the question, and great pressure is brought to bear on the Government by the Press and by public meetings. Mr. Thomas Gibson Bowles has taken the initiative in a meeting lately held at Darlington, where the following resolution was put to the vote and unanimously carried:—

"That, in view of the exaggerated pretensions now publicly put forth by the military Powers of Europe, this meeting urgently calls upon Her Majesty's Government to restore to this country the possession of its natural and lawful means of national defence at sea, by advising Her Majesty to issue an Order in Council declaring that the Declaration of Paris is not binding on this country; and that the chairman be requested to forward a copy of these resolutions to the Prime Minister and the Secretary for Foreign Affairs."

Whatever opinion may be formed in the abstract upon the general question, there is no doubt that, politically, no moment could be more opportune for withdrawing from the Declaration of Paris than the present one, when the great military Powers are leagued together for the purpose of framing rules of terrestrial warfare in their own exclusive interest, and none could impugn the good faith of a nation which refused to hold itself bound any longer by an abstract assertion of principles appended to a treaty, which, though placed by its framers under the invocation of the Holy Trinity, has by the act of Russia practically ceased to exist. W. MARKHEIM.

The Straits of Malacca, Indo-China, and China; or, Ten Years' Travels, Adventures and Residence Abroad. In One Volume. By J. Thomson, F.R.G.S., Author of "Illustrations of China and its People." (London: Sampson Low & Co., 1875.)

MR. THOMSON tells us in his preface that the recollections of his travels are addressed to those readers, of whom he believes there are many, who feel an interest in the remote regions over which his journeys extended; and in that great section of the human family which peoples the vast area of China: a section, as he reminds us, which through the agency of steam and telegraphy

is being brought day by day into closer relationship with ourselves. The number of the reading public that will find in this last work of Mr. Thomson's pen and pencil both instruction and amusement not to be found elsewhere, or in an equally attractive form, we venture to predict will be large. The progress of events, the development of commerce in the Indian and China seas, and the rapid intercommunication now established by submarine cables and steam, have all combined to create a continuous and increasing interest throughout Europe in those outlying Eastern lands. Nor is this interest confined to what concerns the trade of different countries. The political and social condition of all the various nationalities into which the Asiatic race is subdivided over the vast continent and islands extending from the Dardanelles to Japan, has become matter of daily concern to thousands in the present day, where in the last generation scarcely one gave a thought to such enquiries. Nothing has so much contributed to this change as rapidity and certainty of communication. When twelve months were required for an exchange of letters between England and Canton, as was the case not fifty years ago, we all know by personal experience how difficult it is to keep up a continuous interest in persons or things so widely separated.

It would be an injustice to Mr. Thomson if in a review of his book, however hurried or superficial, all mention were omitted of his powers of observation and description, both as a naturalist and an artist. For instance, in introducing us to Penang, so well known on the China route, he gives us a page of natural history which we are certain will be new to the many passengers in the P. and O. steamers who annually touch at this little island, and drive through cinnamon and nutmeg groves to the picturesque waterfall:—

"It will hardly be credited by those who have never visited a hill country in the tropics, that soon after sunrise the noise of awakening beetles and tree-loving insects is so great as to drown the bellowing of a bull, or the roar of a tiger a few paces off. The sound resembles most nearly the metallic whirr of a hundred Bradford looms. One beetle in particular, known to the natives as the 'trumpeter,' busies himself all day long in producing a booming noise with his wings. I have cautiously approached a tree on which I knew a number of these trumpeter-beetles to have settled, when suddenly the sound stopped, the alarm was spread from tree to tree, and there was a lull in the forest music, which only recommenced when I had returned to the beaten track."

Passing from natural history and scenery, he touches on a political and social problem of no small importance, connected with the emigration of Chinese, with their characteristic virtues and vices, and draws attention to a necessity which has long been felt not only in our own colonies, but in California and the United States. He remarks that the Chinaman out of his own country, enjoying the security and prosperity which a more liberal administration confers, seems to develop into something like a new being. No longer chained to the soil by the iron fetters of a despotic government, he finds wide scope for his energies, and high rewards for his industry. But the love of combina-

tions, of the guilds and unions in which all Chinamen delight, tempts them too far :—

"They first combine among themselves to get as much out of each other as they possibly can, and when practicable to monopolise trade and rule the markets; and then, feeling the strength of their own organisation, the societies set up laws for the rule and protection of their members, and in defiance of the local government. The congsoe, or guild, thus drifts from a purely commercial into a semi-mercantile semi-political league, and more than once has menaced the power of petty states, by making efforts to throw off the yoke which rested so lightly on its shoulders. The disturbances at Penak are the latest development of this tendency, and we have had many previous instances of the same insubordination in Penang, and elsewhere. Nor are these the only dangers: the feuds of the emigrants are imported with them, and break out again as soon as they have set foot on foreign soil."

And in confirmation he refers to one occasion while he was at Penang, when a village during the night had been sacked and burned by the members of an opposing clan, and it required strong measures on the part of the Government to put down these faction fights. Still more serious disturbances occurred, it will be remembered, two or three years ago at Singapore, when the whole power of the Colonial Government was for a time set at defiance. This same sort of village warfare and clan fights, is the despair of the Chinese Government in the south. At Swatow these rural clans were only brought into subjection about three years ago by a wholesale butchery, "recalling the summary dealings in 1663 (Javanese era), when the Chinese attempted to overthrow the power of the Dutch Government in Java. It has always been a difficult matter in these islands with the Chinese immigrants. Sir Stamford Raffles found it so during his enlightened administration, and he has left on record his opinion, that the "ascendency of the Chinese requires to be cautiously guarded against and restrained." Upon this subject Mr. Thomson judiciously observes :—

"This is a question which, of late years, has been forcing itself upon the attention of the United States government. They must either restrain the tide of Chinese emigration which has set in upon their shores, or amend their constitutional laws, and adopt some less liberal, though perhaps more enlightened form of special administration, enabling them to deal satisfactorily with a people who bring to their doors habits of toiling industry, the cheapest and most efficient labour, but import at the same time turbulent tempers, an objectionable religion, and some of the grossest vices that can stain the human race."

At Singapore, we get our first glimpse of the marvellous changes a few years have sufficed to bring into this British port, lying midway between India and China—a position of great commercial and even political importance. "Not many years ago," he tells us, "it was a mere desolate jungle-clad island—like hundreds of others in the Eastern seas—with a few fishermen's huts dotted here and there along its coast." But now

"A submarine cable has brought Singapore within a few hours of London, while the opening of the Suez Canal, and the establishment of new steam navigation companies engaged in the China trade, have, to a great extent, done away with the fleets of clipper-built ships that formerly

carried the produce from China and Singapore, by the long Cape route, to England. In the same way the absence of Chinese junka may be accounted for by increased facilities afforded to native, as well as foreign trade, through steam navigation in the China seas. The Chinese and the Japanese too, for that matter, are gradually learning to take the full benefit of the advantages which have thus been brought to their doors. They travel as passengers, and ship their goods, by European steamers. This is not all; they are now themselves organising steam navigation companies of their own. The trade of Singapore, save in times of unusual depression, continues steadily to advance, and since the transfer of the Straits Settlements to the Colonial Office, their commerce is reported to have increased 25 per cent."

Nor from a picturesque and artistic point of view can any Eastern home, as he describes it, be more desirable.

"If it be early morning, there is an unspeakable charm about the spot. The air is cool, even bracing; and beneath the shade of a group of forest-trees which the axe has purposely spared, we see the rich blossoms of orchids depending from the boughs, and breathe an atmosphere saturated with the perfume which these strangely beautiful plants diffuse. Songless birds twitter or croak among the foliage above, or else beneath shrubs which the convolvulus has decked with a hundred variegated flowers. Here and there the slender stem of the aloe, rising from an armoury of spiked leaves, lifts its cone of white bells on high, or the deep orange pine-apple peeps out from a green belt of fleshy foliage, and breathes its ripe fragrance around."

He admits, however, that there are certain drawbacks to a life in this earthly paradise :—

"The heat, for example, is great, and must tell on the European constitution at last. The thermometer shows an average in the shade, all the year round, of between 85° and 95° Fahr., and this high temperature tends with other influences to produce a variety of the most serious disorders which flesh is heir to in the tropics, and a multitude of minor annoyances, of which prickly heat is by no means the least troublesome."

Passing to Bangkok, on the Menam, the "Mother of Waters," and capital of Siam, we come upon a quick succession of dissolving views, where the actual present is but a confused mingling and fusion of the past, with the elements of a future yet inchoate and fluid. It was in 1865 that our traveller first landed and made the acquaintance of a native officer, in charge of the custom-house, who honoured him with an audience, "surrounded by a group of crouching slaves, by half-a-dozen children, and by as many wives." Arrived at Bangkok, he tells us :—

"The King himself is High Priest, and defender of the faith. The late monarch spent about thirty years in monastic seclusion before he ascended the throne, and the distinguished reputation for his knowledge of Sanscrit and Pali scholarship, which he subsequently enjoyed, was due to his having made the Buddhist literature his study throughout this period of his career. Late in life he turned his attention to English, and attained such a proficiency in that language as enabled him to write and converse in it with comparative ease, though with an idiomatic quaintness and force of expression by which his not unfrequent communications to the *Bangkok Recorder* were at once detected. He disliked to have his Anglo-Siamese manuscripts mutilated or corrected; and for this reason he established a royal printing-office, where his English, probably under penalty of death, was set up just as it was written down."

Another slide of the magic lantern shows us

Siam some five years later (we have to guess the date), and we find

"The first and second kings have both been gathered to their fathers, and their sons now reign in their stead. Antiquated laws and objectionable customs have passed out of date, and a liberal policy is being steadily pursued. Slavery has been abolished, and the custom of crouching in the presence of a superior has been discontinued by the express order of the sovereign. His Majesty lately visited Singapore and Calcutta, and the experiences which he gained there seem to have been taken to heart. The education which this young king received from the English governess, Mrs. Leoni-owens, at his father's court, must have had its effect in forming his character; while constant intercourse with foreigners, together with his own manly ambition to make the most of his inheritance, have all contributed to render his career an exceptional one in the history of his country. One might almost suppose that he has in his veins some of the blood of those ancient Cambodian rulers who built their marvellous cities and temples, who conquered and subdued the surrounding countries, and founded for themselves a mighty empire, of which no traces save their stone monuments remain. The influence of a newspaper, published partly in English and partly in the vernacular, must not be overlooked when we take account of the progress of Siam."

Here we must leave our adventurous traveller to pursue his way to the half-buried ruins of Cambodia—magnificent remains of a conquering race long extinct; and from thence to Saigon—the last effort of France to found a colony and an Eastern Empire—on to China, slowly awakening from a sleep of ages. RUTHERFORD ALCOCK.

Social Life in Greece from Homer to Menander.

By the Rev. J. P. Mahaffy, M.A., Fellow of Trinity College, Dublin. (London: Macmillan & Co., 1874.)

MR. MAHAFFY has chosen an admirable subject, at once fresh and important, and has written a very sensible, critical, and suggestive book. The social life of the Greeks, as he says in the introduction, has often been handled, especially by German and French authors. But the "ponderous minuteness" of the Germans "usually tends to obscure the general effect, and leave the ordinary reader with no distinct impression on his mind." Moreover, he has often to point out in the course of his book that the Germans are wanting in sympathy with the humorous and imaginative sides of Greek literature. They are apt to take a great deal for literal truth that was never meant as such. Mr. Mahaffy has the advantage of being one of a people with whom the imagination, if it has not attained to the Greek perfection of form, has at least the Greek freedom from the dominion of hard fact. The French writers, again, who have a good share of the natural capacities needed for the study of Greek life, are wanting in accuracy and research. "A sound knowledge of Greek has not yet been diffused among the French, and so their isolated Hellenists do not write in an atmosphere of correcting friends and carping critics." Mr. Mahaffy's work is sound throughout, showing both Greek scholarship and acquaintance with the modern literature of the subject; and it is at the same time thoroughly readable. He has made it so, not by leaving out details and quotations (which are the salt of a

book of the kind), but by confining himself to great questions and matters of lasting human interest. The standard of morals, the position of women, the relations of classes, the growth of social questions, the methods of education, the general aspects of private and public amusements—these and like topics he discusses in their bearing upon each of the main periods of Greek history.

There are few historical questions of such difficulty, and at the same time of such genuine interest, as that of the standard of morals at different periods. Or rather, we should say, the standards; for we have always to distinguish between the theory and the practice of an age, and again between the rules followed by, and towards, different classes of mankind. Literature is apt to be a very unsafe guide. The great characters of poetry move in an heroic upper region, from which the spirit of idealism excludes common actions and motives. On the other hand, the denunciations of satirists are not only apt to be sweeping and exaggerated (for which allowance might be made), but they often fail, being relative to the manners of the time, to give a clear notion of the standard which the satirist desires to set up. Hence some writers (notably Mr. Buckle) have held that Ethics do not advance with advancing civilisation. Mr. Mahaffy has contributed a chapter to this discussion by his examination of the state of morality in the Homeric age. In opposition to Mr. Gladstone, he shows that the Homeric Greeks are not better in any way than their descendants. They have the sensibility, the quickness, the delicacy of perception and expression of the Greek race, but also the treachery and cruelty, the insubordination, the neglect of the weak, which belong to barbarians, and were very slowly and partially overcome in later times. This is shown in an instance which Mr. Mahaffy justly terms crucial—the character of Athene in the *Odyssey*. It is true that the character of Achilles is free from some of these defects, especially from the vice of lying. But this is exceptional, just as any fine touch of character might be in a modern hero. To elevate truthfulness into an ordinary virtue—in our language, a “duty”—is a step which the Greeks hardly ever took. It certainly lay far beyond the range of Homeric morals.

In the chapter which Mr. Mahaffy devotes to the Greeks of the Lyric Age, the contrast between the Homeric and the later society is well brought out. In the Lyric poets, as he shows, we meet with a wholly new order of thought and feeling, answering in some measure to the changed condition of Greek politics. The passion of love—as Mr. Mahaffy points out, perhaps for the first time—acquired on the one hand a power and vehemence, on the other hand an independence of its merely physical element, unknown to the Epic poets. The change may, indeed, be traced in the later Epics (sometimes called *Cyclic*) of which the arguments have been preserved. In them we find the beginning of the use of love as the moving force of a story. It is in the Lyric poets, however, that this deification of love—this “sublimation” of a natural and universal feeling into a romantic enthusiasm—is first seen in

full force, as the leading motive of a new and brilliant type of literature.

The age of Pericles is treated by Mr. Mahaffy in a way that many scholars may be inclined at first to resent, as a period of falling off in social life, of decay of letters and arts throughout Greece, and of a hard and cruel school of morality. Along with this line of thought he makes almost a personal attack upon Thucydides, as chief spokesman of the anti-social temper of the period. At the same time he almost sets aside the authority of Aristophanes, and even Sophocles is found wanting in some respects as a representative of manners. His women are hard and masculine, the creations of a misogynist. In all this there is a good deal of true and acute criticism. The Persian war must have brought art and civilisation to a standstill all over Greece. Athens was the first to recover, but very much at the expense of the numerous states that had fallen under her supremacy. Both Thucydides and Aristophanes show how completely the political interest had swallowed up every other; nor is much to be gathered for a history of social life from the statuesque heroines of Sophocles. Mr. Mahaffy, however, treats these hard and repulsive features too much from this merely negative side, as so much drawback from the political greatness of the Periclean age. It did not, perhaps, fall within his scope to examine their relation to the history of Greek thought, but it would have been worth while to bring out more clearly that the crisis in practical morality was intimately connected with that speculative crisis to which the name *Sophistic* has been (more or less mistakenly) applied, and which really began in the age of the Lyric poets. The “more daring assertion of self-interest as opposed to principle, of force as opposed to justice,” and the “habit of casuistic dispute and of subtle equivocation” which appear so prominently in the Greeks of Thucydides, are not mere defects in morality, but are in great measure the result of the critical effort—the desire to gain a rational basis of conduct instead of mere custom and tradition. The movement began in the philosophy of the Lyric and Gnostic poets; and the troubled times which followed, while they gave little leisure for working out speculative problems, put the greatest possible strain upon the traditional ethics. It needed the comparative repose of the fourth century to bring about a more hopeful tone of moral speculation; and this was the work of the Sophists, and above all, of Socrates, the greatest of the Sophists. The work, however, had not been done in the time of Thucydides, and it is a mistake to try the speakers in his history, or the historian himself, by standards to which men were only then beginning to feel their way.

The advance from the Periclean to the succeeding age—the age of Socrates and the Middle Comedy—is carefully worked out through the later chapters (viii.–xii.). The first signs of the change are traced in Euripides, whom Mr. Mahaffy defends against ancient and modern attacks. So far as such things are matter of argument, the defence is on the whole successful. Euripides was a realist in poetry, that is to say, he sought

to bring a wider range of ideas and subjects within the range of ideal treatment. Whether in doing so he preserved the poetical elevation of Sophocles is a question of taste on which Mr. Mahaffy does not enter; most scholars would say that he falls very much below his predecessors in that respect. This, however, makes his poetry the more valuable as an evidence of social condition; and accordingly, we are able to trace in him the greater gentleness and more reflective temper which belong to the Athens whose empire was over the manners and minds of Greece. The characteristic features of this greater and more enduring Athens are brought out by Mr. Mahaffy with skill and sympathy; especially the small size of the city—“producing a certain unity and harmony in Athenian culture;” the separation of the sea-port, so that “a certain aristocratic flavour must have ever dwelt about the Athenian, and led to a general feeling of selectness and refinement;” the large leisure enjoyed by the citizens; the love of speculative discussion, the comparative humanity of warfare, the beginning of better notions on the position and duties of women. The position and character of certain occupations, as physicians, cooks, and fishmongers, is happily discussed. The comparison of ancient and modern life is kept steadily in view, and their respective advantages are brought out with a candour, a balance of judgment, and a genial tact that could not be excelled. Mr. Mahaffy is especially happy in insisting on the—

“modernness of Attic life and the contrast of what we call the Middle Ages to both that life and to our own. We are in some respects only coming up to the level attained by the Greeks; in some respects they were striving to attain our level; but we should class both the Greeks and ourselves as developed nations, whereas mediæval culture was rather an early and blind groping towards politics and humane society.”—(P. 344.)

This is a truth long ago insisted upon by Arnold: it is applied by Mr. Mahaffy with fine perception of the essence of Greek civilisation.

The problem of education, for instance presented itself under conditions in some respects parallel to those of the most modern times. The Greek habit of teaching morality by means of the Epic legends has given rise to the saying that Homer was the “Bible of the Greeks.” Mr. Mahaffy points out how universally the Greeks believed that Homer composed his poems with a direct moral aim and compares the use now made of parts of the Old Testament. “I do not know,” adds in a note, “whether any better system of education will be discovered than the moral interpretation of documents, venerable in age and of extreme literary excellence. Certain it is that all civilised men have proceeded on this plan, and no other has yet been tried with success” (p. 32). The remark is striking, and not without bearing on very recent controversy. Mr. Mahaffy is inclined to undervalue the Sophistic and Socratic training—the moral and political discussion which was added in the later Attic period to the traditional music and gymnastic. “Socrates,” he says, “never even hinted at a test to distinguish serious

and useful conversation from idle subtleties and wordy waste of time." The distinction, surely, is one that could not have been made in the time of Socrates, since it presupposes the settlement of logical and philosophical questions that were then raised for the first time. In some respects Mr. Mahaffy claims the advantage for the ancient system, namely, in the stricter moral supervision exercised over boys, in consequence of the peculiar moral risk to which they were liable. They thus retained a "modesty and freshness which is worn off our boys by the soil of school life, and which now no longer dwells among us, save in our delicately brought up girls."

The chapter on Religious Feeling in the Attic Age is full of accurate and thoughtful remarks. Although the topic is not a new one, the analysis given on pp. 350-352 of the intimate connexion between religion and amusement is singularly well put. The result, it is shown, was that "earnestness in Greek pleasure," that "seriousness in sport," which has been reached from a very different point of view by the very un-Hellenic English nation. The Greeks, however, understood the dangers of professional athleticism, and regulated their gymnastics for educational purposes in a way that our authorities have neither the science nor the moral courage to imitate. D. B. MONRO.

Ecclesiastical History in England. The Church of the Revolution. By John Stoughton, D.D. (London: Hodder & Stoughton, 1874.)

IN these pages, which form the concluding volume of a series, Dr. Stoughton brings his account of English Church history in the seventeenth century to a close. The period embraced is little more than the reign of William III., an era pregnant with important results in relation to our ecclesiastical institutions—results, however, which he does little here to elucidate, as he justly observes that they "are to be ascertained only through a careful study of the great religious movements of the eighteenth century." Of the possibility of himself following out the history of these movements at some future day, he speaks somewhat doubtfully; but, however that may be, the five volumes which he has published will always bear honourable testimony to his great industry and research, and to the spirit in which his investigations have been prosecuted.

We cannot but think, however, that in the present volume Dr. Stoughton's labours might have been distributed more advantageously for his readers; for while, on the one hand, he has devoted the greater part of his first three chapters to an account of William of Orange and of political events in the three years preceding the accession—an account which, though carefully authenticated by independent enquiry, really adds but little to what may be found in Macaulay—on the other hand, though English Church history in the latter part of the seventeenth century can be made intelligible only by frequent reference to the state of religious parties and of religious feeling on the Continent, he has almost entirely omitted to bring under notice what was so strictly relevant to

his subject. Occasionally, indeed, we meet with passages which would incline us to conjecture that his own researches have been confined too strictly to what was passing on this side the Channel: the following sentences, for example, if not written under a misapprehension, are certainly calculated to leave an erroneous impression on the mind of the reader. Speaking of the continental policy of William in the year 1687-8, Dr. Stoughton observes:—

"He even decoyed the Pope into his toils, by baits which did more credit to his statesmanship than to his honesty. He persuaded his Holiness to advance money for an attack, as he thought, upon France, in reality upon England. Rome, ever trying to overreach others, was herself overreached; and help, supposed to be rendered for the humiliation of a power then inimical to the Papal Court, came to be applied to the overthrow of a Papal sovereign, and the strengthening of the cause of European Protestantism."

"Throughout the business," he adds in a note, "it was diamond cut diamond." The authority on which these observations are made is a letter—and a very remarkable letter it is—a translation of which may be found in one of the Appendices to Dalrymple's *Memoirs of Great Britain and Ireland*. It was written towards the close of the year 1687, by the Cardinal d'Estrées, when ambassador at Rome, to Louvois, the French minister. The Cardinal had managed to secure the treacherous services of Le Petit, clerk to the Pope's confidential secretary, Count Cassoni; and Le Petit, in exploring his master's bureau, had discovered the whole correspondence between William and the Papal Court. He reported that—

"the English had agreed with the Prince of Orange to dethrone King James II., and place the Princess of Orange, his daughter, upon the throne, and consequently her husband William; that the English were also resolved to take away the life of their King, and of the Prince of Wales if the Queen was brought to bed of a son; and that the Prince of Orange was not to go into Germany to command the Emperor's troops; that it was only a mere pretence to amuse the Pope and the public, in order that they might have no suspicion of this prince's wanting to raise himself to the throne of England; and that for certain the holy father knew nothing of this fatal intrigue against King James II., for he had been only made to believe that the Prince of Orange was to go to Germany."

Now even if we were prepared to accept this letter as correct in the main, it is evident that it contains more than one gross exaggeration; while, as it is, we are in possession of facts which place the relations then existing between William and the Papal power in an altogether different light. We know that the former was aiming, at this very time, not simply at the crown of England, but also at confederating Europe in a league against French ascendancy. We also know that, in the relations then existing between France and Rome, it appeared to Innocent XI. far more important that the arrogance of Louis XIV. should be checked, than that a Catholic king should wear the English crown. The Roman *Curia*, again, was hostile to the Jesuits, whom the monarchs of France and England were supporting with all their influence. And hence Ranke has given it as his deliberate opinion that Innocent was fully apprised of William's designs. His view is evidently shared by Macaulay,

who has noted the singular fact that when the project of the Protestant leader in relation to this country had become a *fait accompli*, his success was regarded with almost unalloyed satisfaction by all the Catholic powers except France, by the *grandes* of Castile, and by the Sovereign Pontiff; though it is difficult to understand how Innocent could have derived any pleasure from finding himself completely outwitted. But, in fact, the policy of James was looked upon as suicidal by all dispassionate observers, and so early as 1685, Burnet tells us, in his *Own Times*, that when at Rome he was assured by Cardinal Howard, "that they were sorry to see the King engage himself so in the design of changing the religion of his subjects, which they thought would create him so much trouble at home that he would neither have leisure nor strength to look after the common concerns of Europe."

There is a certain superficial resemblance in the position of the Nonjurors to that of the nonconforming clergy in 1662, as alike sufferers "for conscience sake," which leads us to turn with some interest to Dr. Stoughton's estimate of the scruples entertained by the former. He does not refer to any of the literature of the subject, nor does he go quite so far as Macaulay, who characterises the Nonjurors' theory as "a superstition as stupid and degrading as the Egyptian worship of cats and onions;" but he briefly disposes of the whole question by that abstract method of treatment which, in deciding upon historical phenomena, is at once so easy and so fallacious. He declares himself "unable to discover the reasonableness" of these scruples, and urges (1) that the case of the nonjuring clergyman "was no worse than that of civilians and ordinary men;" and that "an officer of the Customs or the captain of a regiment might very well feel the same scruples as troubled the rector of a parish or the dean of a cathedral;" and (2) that "the men who showed so much sensitiveness with respect to their former oaths were, many of them, the very same persons, and all of them belonged to the same class, as those who had treated with contempt or indifference like difficulties on the part of the Presbyterians at the time of the Restoration." The first criticism, coming from such a quarter, seems rather surprising; for it implies that the professed ministers of religion are no more bound to set an example of the conscientious observance of religious obligations than the layman; or, to put it in another form, that the discredit attaching to a violated oath would not have fallen much more heavily on the former than on the latter. It is certain that if such had been the prevalent view in the seventeenth century, there would be considerable difficulty in explaining the peculiar tenacity with which King James adhered, to the last, to his belief in the loyalty of the bishops. Dr. Stoughton's second argument has much greater abstract force, but unfortunately it is one which the position assumed by the Nonjuror excluded from the latter's consideration. Holding, as he did, the paramount and unalterable obligation involved in the oath of allegiance to the King *de jure*, all oaths taken in contravention of that oath appeared to him simply as crimes to be repented of. If a Presbyter-

rian clergyman had signed the Covenant, his position was no more deserving of sympathy than that of some soldier of fortune who might have taken an oath of fidelity to a freebooting captain in violation of his sworn allegiance to his rightful sovereign. This theory was defended by the Nonjurors as the keystone of political faith, and it is only just that in deciding on its "reasonableness" they should be heard in their own defence. The "Defence" which Lake, Bishop of Chichester, drew up on his deathbed, and on which Macaulay lays most stress, is really for this purpose of little value, being rather a declaration than a vindication of the author's sentiments. A far better illustration will be found in a series of letters on the subject between Ambrose Bonwicke, who was ejected as a Nonjuror from the mastership of Merchant Taylors' School, and his friend Blechynden, a Fellow of St. John's, Oxford, who had taken the oaths. The position of the Nonjuror, as there maintained by Bonwicke, gives us an exact parallel to that in which the loyal Catholic stood to the Head of the Church. The Pope, the latter held, might be a bad man; his private life might be a scandal to Christendom, and his State policy of a kind calculated to bring discredit on the faith and scatter discord among the nations; but he was still God's vicegerent on earth, and facts like these could in no way justify the sin of schism. Precisely similar was the theory of the Nonjuror with respect to the temporal power. "No resistance," says Bonwicke, in his final reply to his antagonist, "no resistance upon any pretence whatever, is a plain rule that exposes us only to the inconveniences of tyranny; but if every man must be the judge of the actions of his prince, and quit his allegiance whenever he thinks the coronation oath broken, there can be no such thing as peace." The duty involved was of a primary order, and one with which no ulterior considerations could possibly do away; the Nonjuror could no more consent to transfer his allegiance than the primitive Christians could comply with the command to throw incense upon pagan altars. "If," says Lake, "the oath had been tendered at the peril of my life, I could only have obeyed by suffering."

In his fourth chapter Dr. Stoughton gives a detailed account of the scheme of Comprehension and of the so-called Toleration Act which occupied the Parliament of 1689, and his research and criticism render this chapter the most valuable portion of his work. The student will be glad to find in the Appendix the original Bill of Comprehension from the Lords' Journal, together with the alterations made in committee. Dr. Stoughton's investigations have brought to light the fact, overlooked by Macaulay and other writers, that the Commons initiated a Comprehension Bill of their own, independently of that passed by the Lords, during the time that the latter was in progress in the Upper House. In this they definitely rescinded the penal statutes against Dissenters, which the Lords simply suspended. The Bill, as is well known, was shelved by a counter device of petitioning His Majesty to summon Convocation. It is difficult to say whether this was owing, as Macaulay suggests, solely to the machinations

of the High Church party. "The whole atmosphere," says Dr. Stoughton, "seems to have been laden with duplicity . . . and there is reason to believe that if not the parents, yet the nurses and sponsors of the Bill had no objection to have the child perish in its cradle." That the Dissenters themselves were not of one mind he readily admits, but he thinks the instances were extremely rare wherein, as Macaulay has conjectured, the scheme was opposed by Nonconformist divines as likely to result in a diminution of their incomes. He, however, fully agrees with the same authority in regarding the attempt as "too late." Dissent had acquired an organisation and institutions of its own, and preferred the freedom conferred by the Toleration Act to the opportunity of reabsorption and loss of its distinctive character.

With regard to the Act "for exempting their Majesties' Protestant subjects dissenting from the Church of England from the penalties of certain laws," Dr. Stoughton notes as "a curious fact" that the word "toleration" was not used in the Bill from beginning to end. Of the measure itself he speaks with unwonted enthusiasm, and characterises it as "one among a number of instances in which a change comes over the legislative enactments of a nation through a change wrought in the minds of rulers, wrought also in the minds of a people,—the *Zeit-Geist* or spirit of the age,—produced by the discipline of circumstances and by sympathetic impulses." It is very rarely that Dr. Stoughton favours his readers with a generalisation like this, and indeed, in one of his prefaces, he speaks somewhat disparagingly of such disquisitions as "comparatively easy" when contrasted with the labours of a careful and painstaking investigation of facts. Perhaps no work deserves to take rank as history which is not the result of a combination of patient enquiry and sound induction; but one thing is certain, that it is much easier to put forth crude and incorrect generalisations than right ones, and in the foregoing instance it is at least questionable whether the comments are not a total misapprehension. At any rate, we think that in thus completely ignoring and setting aside the criticism of his illustrious predecessor in this portion of English history, Dr. Stoughton has exposed himself to the charge of a slight defect of courtesy. Readers of Macaulay's brilliant narrative will not require to be reminded that it is in connexion with the Toleration Act that he has left us one of the most interesting generalisations that ever proceeded from his pen, in a few masterly observations (for which Guizot had already furnished hints, and which Mr. Freeman has so emphatically echoed), on the characteristic spirit of English legislation. In the eleventh chapter of his History he points out that, though the Toleration Act "did what a law framed by the utmost skill of the greatest masters of political philosophy might have failed to do," and "approaches very nearly to the idea of a great English law," it notwithstanding does not only not recognise the principle of toleration but "positively disclaims it." "The English," he says, "in 1689, were by no means disposed to admit the doctrine

that religious error ought to be left unpunished. That doctrine was just then more unpopular than it had ever been." In short, the Toleration Act was a partial and inequitable removal of grievances for the purpose of conciliating those whose sympathy and support it was just then very inconvenient for the Government to lose. Now if this criticism be correct, and it certainly seems to be quite in harmony with all the facts, it is evident that Dr. Stoughton's view is, to say the least, far too enthusiastic in its conception. At any rate, the *Zeit-Geist* did nothing for the Roman Catholics, against whom the laws with which James had dispensed were re-enforced with new vigour.

The latter part of the volume is principally devoted to short sketches of eminent ecclesiastics, Nonjurors, and Nonconformists of the time, and there is also a brief account, compiled chiefly from Woodward, of the religious societies which trace back their origin to this period.

Throughout the whole work Dr. Stoughton exhibits great impartiality and candour, and his criticisms are distinguished by their freedom from the bias of party; but, notwithstanding, it is sufficiently apparent that, beyond the mere investigation of facts, he aims at the illustration of a principle. Conscientiously opposed to the connexion between Church and State, he selects for special prominence whatever would seem to show the disadvantages and evils resulting from such a connexion; his use of such opportunities is, however, quite legitimate, and the volume well deserves the attention of many who do not share his views. J. BASS MULLINGER.

Our Autumn Holiday on French Rivers. By J. L. Molloy. (London: Bradbury, Agnew & Co., 1875.)

EVERYONE who has taken a share in a boating voyage for boating's sake, and who has the *instinct du canotage* by nature, knows from experience that during such an expedition the mind gets into a state so far elevated above the condition of ordinary mortals who travel in coaches and railway-trains that it laughs at all evil and inconvenience, whilst every good and pleasant thing that comes in the way by accident is appreciated with infinitely more enjoyment than it would be in the exacting temper of every-day civilised existence. If the *canotier* could but preserve the same feelings after the voyage was over, he would not only be one of the happiest of mortals, but he would certainly be a brilliant example of the very wisest kind of practical philosophy. That art of contending against the evils of existence and of enjoying to the utmost the good things which it offers, that art of being happy which has been said, and truly, to be worth more than riches to its enviable possessor, the true *canotier* has mastered. The danger is that by neglecting to practise the art of happiness on dry land during those months of the year in which boating yields its place to more serious pursuits, he may gradually forget it, gradually become less and less genial, good-tempered, patient, charitable, merry, and more and more peevish, irritable, exacting, difficult to please. Mr. Molloy has seized, I imagine, the proper time for writing an

account of his autumn holiday on French rivers. A man who has been on a boating excursion is like a sponge that has been dipped in ether, the ether representing the ethereal boating temper. It evaporates very quickly afterwards, and the evaporation chills. Mr. Molloy has taken good care to write before the ether had time to evaporate, and the result is a book which preserves more perfectly than any other boating book I ever read the gaiety and good temper which boating fosters and encourages. It is easy to imitate these feelings so far as to make a book amusing, and a clever literary artist, however ill-tempered a wretch in reality, might no doubt write in the comic vein if he wanted to make a comedy, just as a dull painter may use bright colours if they make his picture saleable; but we know by a single test that the good temper in this book is genuine—the author is so charitable. He is always ready to laugh at what is laughable, but his perfect charity penetrates everywhere like sunshine. Few travellers in a foreign country escape from the vice of criticising unkindly what they are not accustomed to at home. Mr. Molloy never does this, but on the other hand, when anything strikes him as amusing, he does not feel bound to pass it in silence, he laughs at it openly and heartily. He tells his story with great rapidity, making it rather a succession of situations, often exceedingly comic, than a narrative, and by this system he crowds more character and incident into one volume than the regular narrator would have put in twice the space.

The plan of the voyage is simply to go up the Seine and down the Loire. It is astonishing that Mr. Molloy and his friends should have been imprudent enough to go in a boat without a deck, so that she was always in danger of getting swamped in a little rough water, and actually did get swamped near Rouen, merely because the Seine was as rough as it very frequently is. Another almost unpardonable imprudence was to tolerate a non-swimmer in the boat, whatever may have been the charms of his society on shore. Non-swimmers may be permitted to *subscribe* to boats—that is their proper function in regard to boating—but they should never be permitted to get into them. Fancy having such a companion in an adventure like the following! "Two" is the man who cannot swim.

"This looks about the last of it!" said Two.

"It was the biggest squall yet, and we could see it curling up the long four miles, and stretching from bank to bank. It looked as if for the moment it had conquered the tide, and was driving it back to the sea."

"There was a great *sivish*."

"The waters closed in the usual way."

"On reappearing everyone looked for Two, and there was a moment of painful suspense."

"He came up with his glass in his eye—fortunately close to the boat, to which he clung with decided instinct—and gasped out,—

"I know a fel—"

"But he had swallowed so much water that he could only point. It was a boy on the bank, looking a long way off. We shouted to him, but either he did not hear or we frightened him, for he took to his heels like lightning."

"But Bow was nowhere to be seen."

"Good Heaven! could he possibly—"

"May have stuck to his seat," said Three.

"The boat was keel upwards. We looked—no Bow."

"Two, still full of water, pointed shorewards."

"About a hundred yards away was a straw hat bobbing up and down, washed over and hidden at intervals by the waves. We concluded Bow must be somewhere about it, for no hat, not even the helmet, could have travelled the distance in the time."

"We drifted back towards the middle of the river, where the current was still strongest. Oars, sculls, dressing bags, floor boards, jackets, and everything we had going off on independent excursions. Through the gloom of the shipwreck a smile like sunrise dawned on Two's face, as he telegraphed to Stroke to look at Cording* floating like a cork, tranquil and impassive on the face of the waters. The bolster was triumphant, the delicate Russias† were sinking."

"Stroke swam out to save the artist and another bag which were in imminent danger. Gyp,‡ who had been perched on the keel, and wondering what we were playing at, woke up suddenly to the discovery, and sprang after. This was grander than stones.§ The waves were a little disconcerting, but he paddled manfully through them till he came among the *débris*, and, singling out the biggest, began tugging resolutely at Cording."

It might have been ten minutes when we saw Bow turn back and swim towards us. He seemed to move feebly and with effort. We were laughing at him as he drew near, but quickly stopped when we saw the expression on his face. He was all but drowning, and making desperate efforts to reach us. We were on the wrong side, but before we had time two last strokes brought him to the boat, upon which he fell in utter exhaustion. His clothes and boots, and, above all, a heavy woollen Guernsey, had been too much for him, and before he was half-way were dragging him down. He could go no further; and even as it was, had he not been an excellent swimmer, would never have returned. He said himself, only a few yards more and it might have been hopeless."

"Even shipwreck may become monotonous. We drifted on for three-quarters of an hour—no one in sight, and no possible help at hand; and then—no one saw where it came from—a boat bore down upon us, and, welcome sight, a man in a blue blouse."

This comes of having a long boat (forty feet long), with a low freeboard and no deck. Get her into a chopping sea, and no seamanship in the world can prevent her from filling. She cannot rise and fall between the little waves, which simply topple over the gunwale into her, till filling becomes only a question of time—and not of much time. A decked canoe would have gone through it all with no other inconvenience than wetting the deck, and perhaps the apron. The very next time Mr. Molloy and his friends go out in the *Marie* after their shipwreck, they are near being swamped again. After that they put the boat on the deck of a river tug, and send it a good distance up stream, while they travel and amuse themselves by land. Then they induce different temporary coxswains to embark on board the *Marie*. One is a small boy, the son of a pilot, who leaves his father for the first time and in tears ('tis well he was not drowned); another a stiff, elderly man, who, after sitting so long in a constrained position, declared that he had

* The author means a waterproof bag made by Cording.

† Bags of Russia leather containing part of the luggage.

‡ A little dog who took part in the expedition.

§ The little dog in question had a habit of fetching stones for his amusement, which ruined his teeth.

"grand mal à l'estomac;" but we are glad to learn that repeated doses of Cognac were found to be a speedy and soothing remedy.

All the party stop at Paris because two out of the four are invalided. They go to Meurice's, like green Englishmen, and afterwards don't like to think about the bill. Evidently they enjoyed themselves far more and lived quite as well in the cheap country inns. At this time two of the party have a trip to Paray-le-Monial to see the pilgrims at the shrine. They then resume the oar, but have to go back to Paris, putting up this time at the Bedford instead of Meurice's, "which only turned out to be from Scylla to Charybdis." Beyond Ivry they make acquaintance with a French crew in a sort of yacht-barge with a roomy deck cabin, "fitted up inside with hammocks and every possible comfort. This was at once a *salon*, *salle à manger*, kitchen, and studio, for the crew were artists. They had sail and oars, but did not object to being towed when the opportunity offered."

At Fontainebleau the *Marie* is put on a waggon and taken by road to Orleans, the crew becoming pedestrian. At Orleans they take the water again, and greatly enjoy this voyage.

"Most of our readers will probably have seen all these towns and many parts of the Loire. But it will have been by diligence or rail—shooting suddenly from a tunnel into the heart of the city, and with passing glimpses of the river—for no steamers can ascend above Tours—and Gien, Orleans, Beaugency, Blois, and Amboise are accessible by land only. In no way but the way we travelled is it possible to see what these places really are, and how they are inseparable from the river."

"But for the risk of wearying we could dwell for pages on this one great charm of our wanderings. The happy independence of our little boat—the first on these waters, where none but fishermen had yet passed. Dropping down to these old cities, seeing the towers, churches, and castles open out from so many points of view, and with ever-changing aspect; lying, perhaps, for an hour in one spot in the lazy delight of only looking. Leaving them again, and seeing them die in the vague blue of the distance as we went once more into the loneliness of the river."

They left the Loire at Nantes, going by a canal and small river to Redon, where the cruise ended, as two of the crew found that they had not time for any more boating that season.

In the course of his narrative Mr. Molloy introduces a good deal of French, which gives fidelity of local colour—and his French is the real thing, well remembered or accurately imitated, with hardly ever a mistake. He amuses himself with the more defective French of his companions, one of whom apostrophises a cab-driver as *cochon*, not pleasing him thereby; while another gravely informs a French general that after the upset they had been *quarante-cinq minutes dans l'eau*.

There are many other good things in the book which might be quoted, but I wish to say something about the illustrations, by Mr. Linley Sambourne. Mr. Sambourne sketches the figure with much truth and spirit, so that the book owes much to him (as Mr. Molloy gracefully acknowledges). There are many sketches in the book which are as good in their way as anything possibly can be.

"Just in time," page 30, is one of these. Two of the party have been buying provisions in the town of Havre. They arrive at the quay "just in time" to catch the steamer, on board of which the *Marisee* is already safe and snug, and they have to get down a perpendicular ladder encumbered as they are with bottles, a loaf more than a yard long, and the little dog. The doggie is let down by a rope, and his canine sense of peril is rendered to the life. Indeed, the dog is always thoroughly well done, whatever his attitude, and however minute he may be. There is much character, too, in the landscape sketches, some of which, like those of Blois and Amboise, quite convey the feeling of being actually on the Loire. The sketch of *Samois* is like a clever bit of etching. But now comes a piece of criticism which must be expressed, though it seems ungracious to close a notice of so pleasant a book with anything disagreeable. The plain truth is that a great many of the illustrations are utterly ruined by a frightful mannerism. They are coarse imitations of very coarse pencil drawings, in which broad ragged lines, parallel to each other, or nearly so, are made to do duty for shading, to the destruction of all natural texture, and very often of natural detail too. Let us take the sketch of Poissy as an example. The trees and bushes are shaded with big coarse lines, diagonal or horizontal, which resemble nothing in nature, certainly not the mysterious shade of foliage. The crossed vertical and horizontal shading on the barge and house resembles a portcullis or the bars of a prison-cell. The shading on costume is often so coarse that it might stand for a representation of broad stripes were it not that the same stripes cover trees and boats and river-bank and sky. In some of the illustrations there is even a laborious reproduction of rotten lines, that is, lines like those in a badly-bitten etching. All this is simply deplorable, and the more so that it is the only evidence of bad taste in the whole book, for even the binding is a beautiful piece of true grotesque invention, in which the river, the boat and crew, and many other things are introduced with great skill and quite in the right manner for work of that kind. Having closed the book, we are still glad to see on the outside of it the merry companions who have been companions of our own as we read it. Let us wish them another such voyage, with plenty of peaches to eat and pretty girls to admire (in all honour and innocence), these being apparently their chief delights in the sunny land of France.

P. G. HAMERTON.

Indian Famines; their Historical, Financial, and other Aspects. By Charles Blair, Executive Engineer, Indian Public Works Department. (London and Edinburgh: William Blackwood & Sons, 1874.)

By the partial but far-spreading visitation of the past year, the Bengal Famine of 1769-70 has been repeated in something closely resembling a centenary form: but how different are the circumstances in the two cases! The first calamity, watched by human eye, but barely met by disinterested

human effort, did its fearful and fatal work unchecked till it had carried off ten millions of human beings, or nearly one-sixth of the population of existing Bengal. The deaths we have now to deplore are so few that it is almost a question whether they can be called extraordinary. Of the achieved disaster the progress was noiseless, and hushed the report. In direct antagonism to the prevented evil, statesmen, administrators, theorists, executives, men of divers grades and callings, threw themselves eagerly forward; while the press assiduously and devotedly chronicled results. It is true that in the time of Verelst and Cartier there were neither steamers nor telegraphs, and that all news from India, whether of Haidar Ali, the Marhattas, Oudh or Nepal politics, or local famine or disease, was received but in tardy instalments, few and far between; but the modicum of attention given by the British public to India in those early days of Oriental dominion was perhaps mostly taken up with the matter of new relations then established between His Majesty's Government and the East India Company, regulating the money demand of the former, and limiting the dividends and independent action of the latter. That the famine of 1770, especially severe as it was in India, was not wholly confined to that region, may however be gathered from the testimony of the periodical press to the state of things in Germany and Bohemia:—

"A course of inclement or irregular seasons in some countries, and the miseries of war in others, had occasioned, we are told, a general scarcity of corn, which was more or less felt in every part of Europe. Indeed, the first of these causes, as well as the effect, was unhappily extended to some of the remotest parts of the globe, of which Bengal and several countries in the southern hemisphere afforded melancholy examples."*

There has been no lack of official enquiry into the causes of the recent Indian famine; nor are strictly official papers the only records to which future administrators may refer for elucidation of this all-important subject. It is to be lamented that agencies like those put in operation for arresting the progress of the visitation, agencies which moreover ensure the registration of data calculated to forefend renewed destruction of life, were not similarly in vogue for the famines of Persia and Asia Minor—the first of which has just passed away from the land, while the second still continues to exercise its deadly influence. The great matter now to be considered is prevention. And prevention should be of a nature to entail neither extraordinary effort nor extraordinary expenditure. Such results, however much to be relied on by precedent, are inadmissible, as surely recurring remedies, by the laws of common sense.

Sir Bartle Frere, in his lecture on the late impending Bengal famine, has assailed the views of those economists who would, in India, make all outlay immediately profitable, yet, in England, have no objections to urge against London and Westminster bridges and the Thames Embankment: has expressed an opinion that "great works of irrigation and internal navigation" are

* *Annual Register*, 1771: "History of Europe," chap. viii.

the best safeguards against scarcity in time to come; and has instanced the Deccan surveys and assessments in support of the theory that systematic regard to the condition of the people, and acquaintance, void of undue interference, with their wants and ways, as individuals and in communities, may bring about a healthy relation to Government which would fairly protect the settled Indian district from the ravages of famine (pp. 33, 67). Since the publication, however, of his instructive and interesting contribution to what may be designated the literature of the particular crisis under review, a work has issued from the press which its mere title shows to be of a yet more comprehensive character. Mr. Charles Blair, of the Indian Public Works Department, has produced a small compact volume, well written and well printed enough to invite general perusal; and this gentleman is of opinion, after a fair amount of practical experience, that "famines will recur in India for ever, unless some vast climatological change occurs," a prospect on which he naturally declines to speculate. He adds: "There are various possible methods of mitigating and alleviating such disasters, but to prevent them *in toto*, is, I think, *altogether beyond our control*." We have italicised the last four words as they are weighty and very pertinent.

The book consists of seven chapters, of which the last only professes to deal directly with preventive and mitigative measures, though the preceding matter is perhaps equally suggestive of true remedial action. Migration to favoured districts is approved; irrigation is discussed, and the increase of wells especially recommended; and the importance of opening out the country by road, rail, and canals, as well as all other means of communication, is acknowledged; but it is considered rather Utopian "to suppose that irrigation will ever be able to complement a failure of the rainfall." Arguments are cited in favour of the importation of grain, and useful hints thrown out for fostering any staple article of commerce peculiar to a suffering district, and avoiding the excessive cultivation of certain lucrative crops to the detriment of the more essential cereals. But the natural apathy and caste prejudices of the people are alluded to as opposing a heavy bar to wholesome reforms; and we involuntarily ask whether education is not after all the greatest *desideratum* in securing that intelligent self-help on the part of the "raiya" which can alone set the Government mind at ease in respect of its Indian millions? At present Mr. Blair truly tells us (pp. 202, 203):—

"The idea of a liberal relief by Government is fostered in every one's heart, which is not an encouraging sign: it engenders a feeling of dependence. Government has and should exact its unqualified right to demand that each one will act prudently; that he will exercise thrift in the expenditure of food, and so tend to economise, or in other words to increase, the food supplies. And this is all the more important in India. There it is the custom of the population to subsist for the greater part of the year on their own private stores; they depend to a very small extent on the markets for the provision of food. It is on account of this principle of economising food supplies that Government acts judiciously in

withholding information from the general public as to the amount of relief that it is prepared to give."

We cordially subscribe to the opinion last expressed. But unfortunately the action forced upon the State, and efficiently promoted by private liberality this last year, and which may be repeated in any year, is opposed to the inculcation of this principle of economy. A precedent has been established which is interpreted that there *will* be relief, if required; and this precedent is not one to be disregarded. Those who have lived in India cannot fail to have observed, even in their own private households, how sharply a chance practice once introduced is caught up by the native retainers, and, unless authoritatively checked, converted into inveterate habit.

The inexpediency of Government importing food from a distance while the same measure is open to private speculation, a dictum quoted from Mill, is aptly questioned on the strength of an argument derived from the Indian famine of 1874. Mr. Blair thinks that the action taken by Government on this occasion "will act as a strong stimulus to the trading population in the matter of importation, and that it will be of untold benefit in future dearths." He sees in it, already, good results, "because the private importations being made are very large, much beyond all expectation." And he adds a second instance to a similar effect, showing that at Tonk, in Rajputana, the merchants accepted the import of grain by the State as a guarantee that the step was unlikely to be attended with loss, and exerted themselves so heartily in following suit, that their rulers withdrew altogether, leaving them sole possessors of the field.

Rather than quote further from the volume under notice, we commend it to careful perusal. If it be not written in a very hopeful or sanguine strain, or if it do not supply tangible or palpable remedies for recurrence of the disaster which is its groundwork, it is at least readable, practical and suggestive. To those who have Indian experience of their own to guide them, it will prove more valuable than to simply English readers; for they will be able to supply many *lacunae* in the data given, as well as to test the value of conclusions which, though the legitimate product of personal observation, are often insensibly coloured by personal idiosyncracies acted upon by circumstance.

In conclusion, we would express acquiescence in much of the purport of Mr. Blair's views on the criticisms of the home press. At the same time we believe that the exercise of the power to which he refers acts, upon the whole, beneficially in the prevention as in the detection of administrative errors; and we had rather, therefore, find its range widened than restricted. To us, the failure of the press in these cases, is in being led, or often misled, by the opinions of authorities with whom their correspondents come in contact, not always the most reliable, sound or independent. By this means much is censured that really deserves applause; much is praised that is open to censure; and much good honest work is wholly lost sight of, that should be made public. The reasoning here applies to

many more matters than Indian famines, and, in these days of rapid communication, obtains illustration from Asia and the East in almost weekly instalments.

F. J. GOLDSMID.

Bluebeard's Keys, and other Stories. By Miss Thackeray. (London: Smith, Elder & Co., 1874.)

THERE is a subtle charm in Miss Thackeray's writing which is not easily defined in words. It is like the scent of an old-fashioned garden on a dewy evening, and we are as grateful for the memories and associations it brings back to us, as for its own sweetness and worth.

Her stories are a series of exquisite little sketches full of tender light and shadow and soft harmonious colouring; she

"adds the gleam,

The light that never was on land or sea,"

to commonplace things, so that when we have finished reading one of her books, we instinctively begin to put the circumstances of our own lives into the most picturesque attitude possible. She gives us also a pleasant sense of being at peace with ourselves; she is so genial, so sympathetic, so many-sided, that we seem to have a friend near us who is putting into smooth and pleasant words undefined thoughts of our own, who brings from remote corners of our brain long forgotten gleams of sunshine, sweet dim faces, sights and sounds of long ago, until we are surprised at the amount of our own resources.

And it is not only the picturesque side of the commonplace which Miss Thackeray puts before us, for she has inherited much of the power, which her father had above all other writers, of feeling in their due proportions the humour and the pathos of every-day life.

Wordsworth has said of the poet, that "he is one endowed with more sensibility, more enthusiasm and tenderness, who has a greater knowledge of human nature, and a more comprehensive soul than are supposed to be common among mankind . . . one who rejoices more than others in the spirit of life that is in him." This "spirit of life" is pre-eminent in all Miss Thackeray's writings: in *Elizabeth* breaking through the formalities of the French pastor's home, and asserting her own true self through all her pathetic little love story: in the breezy *Village on the Cliff*, with its naïve little Katharine, its ugly fascinating Frenchmen, its large-hearted Reine: in the pretty stories which have modernised so gracefully our old fairy tales, the last volume of which, *Bluebeard's Keys and Other Stories* (Smith, Elder & Co.) lies before us. And none of the sketches are more charming than these last four. The Roman life in the first story of "Bluebeard's Keys," the Swiss pictures in "Riquet à la Houpe," the quiet English scenery of "Jack and the Beanstalk," and the pretty bit of Normandy in the "White Cat," are as faithfully described as the fairy tales are successfully represented. Bluebeard is an Italian marquis, who nearly scares away the wits of his little Irish betrothed, and finally becomes a monk. Riquet à la Houpe is a certain Tom Rickets, who

wins his love by sheer strength of purpose, and in spite of every personal disadvantage; Jack is a clever and high-minded young farmer, who overcomes a giant squire, and carries off his harp in the shape of his daughter; and "The White Cat" is a pretty young girl in the white dress of a novice, who is saved by her lover from the convent life which she dreads.

It is unfortunate that Miss Thackeray's gift of language has led her into a certain indistinctness of utterance that may become, if not corrected, a serious blemish on her writing. *Old Kensington* suffered from it, and there are some notable examples of it in the book before us. Miss Thackeray feels herself so entirely *en rapport* with her readers, that she believes, and probably believes rightly, that they will gather her meaning from such a passage as the following, which occurs in "Jack and the Beanstalk":—"Foxslip Wood in summer-time is a delightful place, green to the soul. Beyond the coppice here and there, where the branches break asunder, *sweet tumults of delicate shadowy hills are flowing to gleams of light cloud.*" "With some people everything means everything," Miss Thackeray tells us, and, therefore, we need not ask the meaning of "Miss Gorges' curious pale blue sympathetic glances;" but, with every wish to understand it, we find ourselves baffled by this next quotation:—

"Some years are profitless when we look back to them; others seem to be treasuries to which we turn again and again when our store is spent out—treasuries of sunny mornings, green things, birds piping, friends greeting, voices of children at play. How happy and busy they are, as they heap up their stores. Golden chaff, crimson tints, chestnuts, silver lights, it is all put away for future use; and years hence *they will*" (who will?) "look back to it, and the lights of their past" (whose past?) "will reach them as starlight reaches us—clear, sweet, vivid, and entire, travelling through time and space."

This indistinctness is only to be found in Miss Thackeray's later writings; there is no trace of it in *The Story of Elizabeth*; and it seems a pity, when her thoughts are so well worth having, that they should be kept from us by any obscurity or hurried and careless expression.

But these blemishes are few in number when compared with all the passages that are as beautiful as the following from "Bluebeard's Keys":—

"It was a great dazzling Italian day. Italian days seem longer and more vivid than any others. Every minute is marked; something is happening and passing away, reflections lighting the red cypress trees, flowers blooming, pigeons flying across the blue, or rubbing their breasts upon the yellow marble of a window lintel, waters foam, and figures fill their earthen pitchers. You look up at the great palaces with their treasures enshrined; outside are stone galleries with blue, high vaults, and statues and pictures glittering and alive. A grand conception of a saint in flying drapery comes down the steps of the Pincio. Little Beppo and his sister, the little models, come dancing to the carriage-steps with soft monkey-hands. Some one flings them a silver coin, and the boy and girl dance back, laughing, and pointing their ribboned feet. Beppo flings his little high-crowned hat into the air; Stella tumbles over with a winsome little caper, as she gives her coin to her beautiful Albanian mother, who sits watching the children with her chin upon

her hands, and a great basket of violets shining at her feet."

And the Swiss vignette is as beautiful in its own way:—

"Here, out of my window, is a sketch ready made—a grey, sloping roof, with wooden beams, and moss-grown stones upon the tiles. There is a wooden balcony, where a woman sits at work all day. There is a garden down below, full of lupins and sunflowers and scarlet runners against a trellis; the hotel cook is walking there between his courses all dressed in white. My sketch is too big for the paper, as many sketches are. It scarcely takes in the plums, or the apple-tree all studded with crimson fruit. There is a chime in the air, torrents foam, birds fly from height to height, the goats tinkle home at night, each cow rings its bell as it browses the turf and the wild thyme, the people are at work upon the hills reaping their saffron crops. If I look out I see a mountain with a grey dome of clouds and shadows," &c.

This sort of writing is nearly as good as change of air. We must give one more short extract, which is worthy of Miss Thackeray's father:—

"There are some people who, all their lives long, have to be content with half-brewed ale, the dregs of the cup, envelopes, cheese-parings, fingers of friendship. To take the lowest place at the feast of life is not always so easily done as people imagine. There are times and hours when everybody is equal, when even the humblest nature conceives the best, and longs for it, and cannot feel quite content with a part. You may be courageous enough to accept disappointment, or generous enough not to grudge any other more fortunate; but to be content demands something more tangible besides courage or generosity."

F. M. OWEN.

NOTES AND NEWS.

WE are informed that Mr. F. York Powell, of Christ Church, Oxford, has completed the translation of the *Færeyinga Saga* upon which he has been for some time engaged, and that the work will probably appear this autumn.

THE suggestion made by Professor Huxley in these columns that an English translation of Haeckel's *Anthropogenie* should be published, has been anticipated by Messrs. King & Co., who have already put the work in hand. The translation of the same author's *Schöpfungsgeschichte*, or *History of Creation*, reviewed by Professor Huxley in the first two numbers of the ACADEMY (October and November 1869), is in the press.

MR. KEGAN PAUL's book on "William Godwin, his Friends and Contemporaries," will go to press immediately, we hear, and will appear in the spring. It will contain portions of an autobiography of Godwin, and large selections from his correspondence, as well as from letters hitherto unpublished of Mary Wollstonecraft, Coleridge, Charles Lamb, Horne Tooke, the Wedgwoods, Curran, Wolcott (Peter Pindar), Macintosh, J. Kemble, Mrs. Siddons, Mrs. Inchbald and others.

MR. WM. MACMATH, of Edinburgh, has been fortunate enough to find the Glenriddell Ballad MS. which Professor Child has been so long in search of.

MR. FLAVELL EDMUNDS, for many years editor of the *Hereford Times*, died on Christmas Day. He was author of an ingenious philological work, entitled *Traces of History in the Names of Places* (Longmans, 1869), and by his knowledge of botany and archaeology did good service to the Woolhope Field Club, of which he was a zealous member.

MR. THOMAS STEPHENS, well-known in connexion with the history of the language and literature of Wales, died on the 4th inst., at Merthyr Tydvil. His *Literature of the Kymry*, which appeared in 1849, and which created a revolution in the literary history of the Principality, was some years ago translated into German. This was his principal work, and almost the only one which he published in a separate form; but many essays by him, most of which are very valuable, are published in the *Archaeologia Cambrensis* and other periodical publications. Among these essays, his papers on the Triads, contributed to a Welsh quarterly journal, and his dissertation on the supposed discovery of America by Prince Madog ab Owen Gwynedd about the year 1170, printed in a Welsh monthly magazine, might be mentioned as possessing peculiar value to the historical student.

IN the last number of the *Revista de España*, the Vizconde de San Javier narrates a terrible episode in Spanish history, strongly reminding us in some particulars of "the man in the iron mask." When Maria Luisa died at Rome in 1819, she left, among other legacies, one to her last confessor Fray Juan de Almaráz, who, finding himself unable to obtain its payment from her son Fernando VII., at last took the imprudent step of writing to him to the effect that the queen had authorised him to reveal after her death that none of her sons were the sons of Carlos IV. Greatly disquieted, the king determined to silence him, and the unlucky priest was kidnapped, placed on board ship, and conveyed to Peñíscola, where he was secluded from all human intercourse, his very name being unknown to his gaolers. When he had been in prison three years, the king sent the Archbishop of Mexico to him with a promise that if he confessed his offence and signed a formal retraction, he should be pardoned. Fray Almaráz signed this document, but remained in his old prison. The archbishop ventured upon a remonstrance, but was told that the king wished to forget the matter entirely, that he had fulfilled his mission, and that he must think no more about it, if he did not wish to receive a terrible proof of his Majesty's displeasure. After the death of Fernando, the unfortunate confessor was released. One month after leaving Peñíscola he died mad. This has the air of a novelette, but the Vizconde assures us that the documents relating to the affair, or at least a great part of them, are preserved in the archives of the Ministerio de Gracia y Justicia.

THE Camden Society have authorised Mr. W. D. Hamilton to print, as an appendix to Lord Henry Percy's *Chronicle of Henry VIII.*, the original documents relating to the trial of Anne Boleyn from the *Baga de Secrets*. They have hitherto been known merely from the abstract given in one of the Deputy Keeper's reports, in which some points of importance did not receive sufficient notice.

THE New Shakspeare Society last week sent out its final issue of books for 1874 to its subscribers. 1. *Romeo and Juliet*, parallel-texts of the first two quartos Q1, 1597; Q2, 1599, edited, with an Introduction, by Mr. P. A. Daniel, and "presented to the members of the New Shakspeare Society by H.R.H. Prince Leopold, one of the Vice-Presidents of the Society;" 2. *Romeo and Juliet*, reprint of Q1, 1597; 3. *Romeo and Juliet*, Q2, 1599, both edited by Mr. P. A. Daniel; 4. *The Still Lion*, an Essay towards the Restoration of Shakspeare's Text, by C. M. Ingleby, M.A., LL.D., Trin. Coll. Camb., "a copy is presented to each member of the New Shakspeare Society," by the author; 5. *The Succession of Shakspeare's Works*, and the Use of Metrical Tests in settling it, being the Introduction to Gervinus's *Commentaries on Shakspeare* (Smith, Elder and Co., 1874), by Fredk. J. Furnivall, M.A. (hints for beginners, presented by the writer).

WE hear that Messrs. Macmillan have in an advanced state of preparation a series of Literature and History Primers, modelled after their Science

Primers, and edited by Mr. J. R. Green, M.A., author of the recently published *History of the English People*. The first of these, *English Grammar*, Dr. Morris, will appear very shortly, and will be followed in quick succession by *English Literature*, Rev. Stopford Brooke; *Latin Literature*, Rev. Dr. Farrar; *Philology*, J. Peile, M.A.; *Europe*, E. A. Freeman, D.C.L.; *England*, J. R. Green, M.A.; *Rome*, Rev. M. Creighton, M.A.; *Greece*, C. A. Fyffe, M.A.; and *France*, Miss C. M. Yonge.

PROFESSOR KIELHORN, the Principal of the Decan College, Poona, has just published a Catalogue of Sanskrit MSS. existing in the Central Provinces, prepared by order of E. Wilmot, Inspector-General of Education, (Nagpur, 1874). The catalogue is classified, and the books arranged alphabetically in each class. Useful as these catalogues are, it seems high time to make a change. The mere repetition of a well-known title is useless. What is really wanted is scholar-like descriptions of rare and really important works.

THE new number of the *Deutsche Rundschau* contains some valuable articles, though it is not so perfect as the last. The story, "Ricordo," by Putlitz, is written simply in order to write a story. Not one of the characters is properly modelled, not one excites any deeper interest. The only excuse for so inarticulate a story is to suppose that it was not invented, but true. Dr. Böhr's account of the "Tidschi Islands," and his interview with the ex-King Thakombau, will interest readers in England who take a pride in this last jewel added to the British crown. Leaker's second article on "Education" is full of good intentions, and written in a fluent, sometimes too fluent, a style. We should have liked more facts and statistics, and far more warmth and determination in discussing a question on which the whole future of Germany depends. For the coming war of education Germany will want a Bismarck and a Moltke rolled into one. We are surprised at the extracts from Brandt's Diary. General von Brandt was attached to Prince Napoleon, when he visited the late King of Prussia in 1857. Whatever the feelings of the Court may have been, Prince Napoleon was the guest of the King, and such things as are here related should not be published during the lifetime of the person whom they concern, if ever. The duties of hospitality are sacred, even during war, and crowned heads will have to be careful when staying at the Castle at Berlin if the officers in waiting are of the stamp of General von Brandt. Geibel's poem is strong in descriptive power, but surely such a *Seerüberggeschichte* might be left to smaller poets.

A new edition of the Yajurveda is advertised at Calcutta. It will contain the text, the commentary, and a translation. Dr. Weber, of Berlin, who published the text and commentary of the Yajurveda in 1849, is likewise preparing a translation of that work, which, though belonging to a much later period than the Rig-Veda, is of great interest as illustrating the sacrificial system of the Brahmans.

M. GEORGES PERROT, who has been elected a member of the Académie des Inscriptions et Belles-Lettres in the place of Guizot, is best known by his archaeological exploration of Galatia and Bithynia, undertaken at the expense of the French Government. It was he who discovered the *Index Rerum Gestarum D. Augusti*. He is also the translator of Max Müller's *Lectures on the Science of Language*, and of two volumes of his *Chips from a German Workshop*, published under the title of *Essais sur la Mythologie Comparée*, and *Essais sur l'Histoire des Religions*.

IN the *Revue des Deux Mondes* for December 15, there is an interesting article on the loves of M^{me}. de Sabran and the notorious Chevalier de Boufflers. In the number for January 1, M. Othenin d'Haussonville has a first article on

sainte-Beuve, carrying the narrative of his life and works down to 1830. The occasion of the article is the publication of Sainte-Beuve's correspondence with a schoolfellow who became a priest, which proves that he retained his belief in Catholicism with a good deal of schoolboy candour up to eighteen or nineteen. His subsequent changes up to the age of six-and-twenty, when a more or less platonic love led him back to more or less platonic orthodoxy, are traced with apparent candour, and with the air of authority which comes from access to special information. M. George Bousquet gives an interesting account of a visit to Yezo, the northernmost island which belongs beyond dispute to Japan, which is larger than Ireland, and has a total population of 76,850, including 16,000 Ainu, a singular aboriginal race, with many analogies to the North American Indians. The interior of the island is almost entirely covered with forests, it is known to contain valuable mines, and M. Bousquet thinks it would be better to leave these resources to be developed by private adventurers in search of fortune, instead of trying to colonise the island by the authority of the Government, an enterprise which is at present pursued with American assistance and grotesque results. The *Revue* announces that it will shortly publish "Flamérande," by George Sand, and "Un Mariage dans le Monde," by M. Octave Feuillet, and that the "Table de la *Revue des Deux Mondes* de 1851 à 1874" will be ready immediately.

A GERMAN lady, Countess Prokesch (Frederike Fossman) has attempted—with more ingenuity, perhaps, than real profit to literature—to collect in one volume all the poems which could be gathered together from the works of German poets in honour of the Rose. Royalty figures largely in his rose-garden of poetry; and while Prince Adalbert of Bavaria heads the series of rose-songs with a special adulatory address to the queen of lovers, the Grand Duchess Vera of Russia, wife of Prince Eugène of Wurtemberg, closes the list with a composition of decidedly gloomy colouring. The German supply of rose-poetry is completed in the Countess's compendium by well-turned translations from the writings of Anacreon, Béranger, and Tom Moore, and from other equally incongruous sources.

THE Strassburg University Library has been recently enriched by the reigning prince of Benheim-Steinfurt, through the presentation of a valuable collection of books which had belonged to the now secularised monastery of Frenswegen, near Nordhorn, in Osnabrück. The collection, which consists of upwards of 1,000 volumes, includes fifty MSS. in Latin and Low German, written on vellum and paper, which are remarkable as choice specimens of calligraphy. Some of the Low German MSS. are in the Westphalian dialect of the locality, which gives them special value from a linguistic point of view, while the presence in the collection of 150 incunabula makes this a doubly important addition to the contents of the Strassburg Library, which at the time of the disastrous siege lost all the numerous incunabular impressions for which it had been so distinguished.

THE death is announced of the distinguished economist, M. A. Audiganne, author of *Populations ouvrières de la France, Ouvriers en famille, &c.*

THE *Bibliographie de la France* gives some details of the history of the *Gazette de France*, which has just been put up to auction. It was founded in 1631 by Théophraste Renaudot, physician to the King, who may be regarded also as the founder of the modern pawnshop and advertising office. It first appeared once a week with four quarto pages, next with eight pages, which form it retained till nearly the end of the eighteenth century, when it became a daily paper. It was at first devoted chiefly to advertisements, general news occupying a very subordinate place; and it was long prosperous in spite of the competition

of the *Mercur*, which was started soon after the *Gazette*. The National Library possesses a complete set, consisting of 180 quarto and 128 folio volumes, which occupy a space on the shelves of sixteen mètres in length.

THE *Liberté* gives some interesting statistics with regard to French literature during the year 1874. The total number of books, including original works and new editions, printed throughout the whole of France was 11,917, beside periodicals of all kinds. There were also 2,196 engravings, prints, and maps, and 3,841 numbers of vocal and instrumental music, raising the total number of publications to 17,954. These results are the more satisfactory, as in the highly prosperous year 1869, only 17,394 publications were registered; in 1870, 8,831; in 1872, 10,659; in 1873, 11,530. The average for the last twenty years has been about 15,000, of which 10,000 are printed works, 3,000 engravings, maps, plans, photographs, &c., and the remaining 2,000 musical publications.

WE have received *Shakespeare's Dramatic Works*, with notes by S. W. Singer, and a *Life* by W. Watkiss Lloyd, vols. i. and ii. (Bell & Sons); Renshaw's *The Cone and its Sections treated Geometrically* (Hamilton, Adams & Co.); Bäder's *Central Italy and Rome*, fourth edition (Leipzig: Bäder); *Prussia in Relation to the Foreign Policy of England* (Hatchards); Von Sybel's *Clerical Policy in the Nineteenth Century*, translated by J. Scot Henderson (Hatchards); *Englische Grammatik*, von E. Mätzner, zweiter Thl., erste Hälfte, second edition (Berlin: Weidmann); *Das Verbrechen des Hochverraths*, von W. E. Knitschky (Jena: Mauke); *Der Kindergarten*, bearbeitet von H. Goldammer, 1. u. 2. Thl. (Berlin: Lüderitz); *Das Verbrechen des Mordes und die Todesstrafe*, von F. von Holtzendorff (Berlin: Lüderitz); *Studien zur Geschichte der alten Kirche*, von F. Overbeck, 1. Hft. (Schloss-Chemnitz: Schmeitsner).

THE *Journal des Débats*, in a short historical sketch of the Marshalate of France, states that the first person on whom that dignity was conferred was a certain Pierre-Pierre, created in 1185, and the last marshal nominated under the old monarchy was the Comte de Rochambeau, Washington's companion in arms, in 1791. The total number of marshals created between 1185 and 1791 was 256. Under the first empire (1804–1813) twenty-five marshals of France were created, Berthier, Prince de Wagram, being the first, and Prince Poniatowski the last; under the Restoration nine marshals, beginning with the Duc de Coigny, and ending with the Comte de Bourmont; under the Monarchy of July there were nine creations, the first being the Comte Gérard, and the last the Vicomte Dode de la Brunerie; from 1850 to 1870 nineteen creations, the first marshal nominated being Prince Jérôme Bonaparte, and the last General le Bœuf. The total number of creations since the institution of the marshalate in 1185 to the present day is 318.

FROM a newspaper published in the year 1761 we get the following astounding piece of information dated from the Hague, April 17:—

"Two men are arrived at Cologne, who say they came from Damascus. The Jesuits of that town have been with them, and talked to them in Latin, Greek, Hebrew, and Chaldaic. They answered them in all languages. They say they are come by the order of Heaven, to turn men to repentance. They give out they are 700 years old, and that the world will infallibly be at an end in 1773. The Jesuits have obtained leave to carry them to Rome. Being put in irons, they were glad of that opportunity of proving the truth of their mission by breaking them. They say:—

"The war will be general in . . . 1765
Constantinople destroyed . . . 1766
The true God acknowledged by all nations . . . 1767

A valiant man give his testimony to it . 1768
England overflowed . . . 1769
An earthquake all over the world . . 1770
The fall of the sun, moon, and stars . 1771
The globe of the earth burnt . . . 1772
The universal judgment . . . 1773

"The French envoy at Cologne has received orders to examine them strictly."

THE little biographical sketch which follows, singularly illustrative of clerical manners and morals a century back, is derived from some manuscript jottings of a contemporary fellow-worker in the Church of England, the Reverend William Cole, of Milton, Cambridgeshire:—

Lamb Robert, Bishop of Peterborough, Fellow of Trinity College. He died in the first week of November, 1769, at his rectory of Hatfield, being taken ill on horseback, in the field in hunting, and carried home, where he died immediately. He was brother to Sir Matthew Lamb, steward and agent for the Earl of Salisbury, and member for Peterborough, who died very rich a little before him. The bishop died a bachelor, and was a *bon vivant*, and was supposed to have rather injured his health by a too free use of the bottle, but was otherwise a very worthy man, and much esteemed. He was buried at Hatfield. He was disposed to have rebuilt the palace at Peterborough, where he laid out much on the preparations and ornaments, as he had before done at the Deanery, but was diverted from it by Sir Matthew his brother. It was said that both the Bishop and Sir Matthew were remarkably ignorant in their professions, the one as a lawyer, and the other as a divine; the latter having twice been refused orders for insufficiency, as the former was particularly noted by Lord Chancellor Hardwick as unworthy of the usual honours and promotions in his profession. Perhaps both may be exaggerated.

FROM a memorandum attached to a manuscript volume in the British Museum of "Collections relative to the Family of Murray, of Stanhope, in the County of Peebles," are to be gathered some curious bits of gossip. The papers, which are of not much general interest in themselves, chiefly relate to Sir Alexander Murray, Baronet, and his brother Charles. Sir Alexander was the husband of the celebrated Lady Murray, "whose delightful Memoirs some few years since were presented to the world by Thomas Thompson, Esq., in a private publication—but which attracted so much notice that a new edition for sale was published in a smaller size." Her ladyship, we are reminded, in her own time created a considerable sensation in the fashionable world, and the attempt to ravish her by Arthur Grey, her footman, contributed not a little to her notoriety. Lady Mary Wortley Montague made the rape the subject of a ballad remarkable for its indelicacy, *not* (adds our informant) included by Lord Wharnclyffe in his edition of her ladyship's works. One paper in the collection is a copy of a petition addressed by him, September 24, 1715, from the Marshalsea to the Duchess of Marlborough, to procure his liberation from thence. He was confined in that "expensive and unwholesome prison, so prejudicial to his health and narrow fortune" (to quote his own words), on account of his connexion with the Rebellion.

NOTES OF TRAVEL.

DR. ANDREAS, who left England this week, is employed by the German Government, as we have before mentioned, on a scientific exploring expedition to Persia. He first proceeds to Shiraz, where he will be joined by a photographer. Dr. Andreas will then explore the province of Khuzistan, the ancient Susiana, and valuable results may be anticipated from his labours. For he is a ripe scholar, and is deeply impressed with the necessity for combining sound geography and a knowledge of early writers on

topography with archaeological investigations. He has made himself familiar with all that has been written by Tabari, Istakhri, and Ibn Haukal on the localities which he is about to visit. Many mistakes may be traced to a want of knowledge of the early writers, especially in the identification of sites; and we may confidently anticipate rich fruits from the exact knowledge and scholarly training which Dr. Andreas will bring to bear upon this field of research. The region which will first receive his attention is most interesting, for it includes the sites of Susa, of many Sassanian ruins and inscriptions, and the scene of the first victorious campaign of Ardshir Babegan. It is probable that, after completing his investigations in Khuzistan, Dr. Andreas will extend his travels to the unvisited city of Lar in Fars.

A NEW company has been formed in Dundee for whaling and sealing, which shows that there is no lack of enterprise on the banks of the Tay, and that voyages to the Arctic regions continue to be lucrative. It is called "The Dundee Polar Fishing Company," and the new company has just bought two fine steamers at Hamburg, the *Jan Mayen* and *Nova Zembla*. This increasing activity in the whaling trade is certain to lead to geographical discoveries, as year by year the chase is extended farther down the Gulf of Boothia, and in other directions.

THE letter from Colonel Long that was read at the meeting of the Geographical Society on Monday conveys some rather startling geographical information. This officer was sent by Colonel Gordon on a mission to 'Mtesa, the King of Uganda, who received him in a most friendly spirit, and even sacrificed several human beings in his honour. Colonel Long was taken for an excursion on the Victoria Nyanza, which he found to be, at the outside, only twenty miles across. His geography is, however, somewhat hazy, and will require confirmation.

A MEMORANDUM has just been published in Calcutta by Mr. Wynne, of the Geological Survey, and Dr. H. Warth, of the Inland Customs Department, on the extensive trans-Indus salt region in the Kohát district. The area occupied is within 1,000 square miles of country, extending from the British frontier eastward to the Indus, and lying between Kohát and Bannu. The stratification is well marked, the purity remarkable, the visible thickness of the mass over 1,000 feet, and the supply, practically speaking, inexhaustible. At the five quarries there are two methods of extracting the salt in vogue, gunpowder being used at some places and the salt being given to merchants in irregular pieces, while at others the salt is detached in slabs by means of pickaxe and wedge. These slabs are of uniform weight, care being exercised to prevent the slabs being too large. The workmen are about 400 in number and their earnings amount to about 15,000 rs. per annum. Storing the salt is at present impracticable, but it would undoubtedly pay to do so during the hot season for the winter trade. Happily for Indian finance, the measures taken to prevent the cheap trans-Indus salt from crossing into the parts of the Punjab which consume the highly-taxed salt of the Salt Range are greatly assisted by the constant difference in colour, the former being usually of some tint of grey, and the latter red or colourless. The trade of this salt is thus all to the west, and it is said to go to Kabul, Ghazni, and even Kandahar and Balkh, the price being, of course, enormously enhanced in transit. Dr. Warth concludes his report with an opinion that Government is selling its cheap salt at a dead loss, and should recoup itself from the frontier states by imposing a duty.

THE Admiralty have printed a second part of Captain Nares's *Reports on Ocean Soundings and Temperature in the Antarctic Sea, Australia, and New Zealand*, 1874, with three plates showing the isothermal lines at different depths. It appears that the icebergs met with by the *Challenger*

were usually from a quarter to half a mile in diameter, and about 200 feet high; the largest was seen furthest south in latitude 66° 40'; it was at least three miles in length, and was accompanied by several others nearly as large.

DURING the last two seasons a Russian expedition has been exploring in the extreme north of Siberia, about the vicinity of the lower Tunguska and Olenek rivers. This region was a virgin field for research. It lies some distance to the west of the country visited by Middendorf, and the natural features have been hitherto shown on maps in the vaguest fashion. Messrs. Chekanofsky and Muller, two Russians of scientific attainments, have now travelled northward along the water-parting of the Tunguska and Olenek, and have made several important geographical discoveries, beside fixing several points. Their report was dated July 2, and they had not then reached the shores of the Arctic Ocean, but there is every prospect of their having had time to do so since, and so making a highly interesting journey, for our sole knowledge of this portion of the coast-line of Siberia is derived from the uncertain accounts of the surveyors despatched by the Empress Catherine to map out that limit of her dominions.

THE most noticeable contribution to the *Geographical Magazine* for January is an exhaustive review of Livingstone's last journals. The reviewer gives a summary of the great traveller's later journeys, which he divides into four parts, the first including the route from the Rovuma river to Lake Nyassa, the second referring to the basin of the Chambeze and Lualaba, the third relating to Lake Tanganyika, and the fourth to the Manyema country. A sketch of the work of the Portuguese explorers Lacerda, Pereira, Gamitto, and Monteiro, in so far as it joins that of Livingstone's, is given, and this leads to the remark that in this and other respects the work has unfortunately received careless editing, a statement which it is impossible to help agreeing with, albeit the book has received favourable notice in various quarters. An excellent map of Equatorial Africa serves to illustrate both the review and a paper on Lieutenant Cameron's survey of Lake Tanganyika. Among the notes deserving mention are a rather full account of the approaching British Indian mission to Yunnan, a notice of a recent Russian caravan journey to Mash-had, and an announcement of the selection of an Austrian naturalist, Herr Marno, to accompany Colonel Gordon's expedition up the Nile.

NOTES OF A TOUR IN THE CYCLADES AND CRETE.

I. Delos and Rheneia.

IN the forenoon of March 18, 1874, I was rounding Cape Matapan in the French packet, having left Marseilles three days and a half before, the two first of which had been passed in clear and calm weather before we reached the Straits of Messina, after which time we had been tossing "in Adria," as the sea between Sicily and Greece was regularly called by the Greek geographers, which from the meeting of the Adriatic and Mediterranean currents is usually a disturbed piece of water. The lofty range of Taygetus, which runs northward from Taenarum, and attains its greatest elevation on the western side of the valley of Sparta, formed a conspicuous object from the masses of snow, with which its peaks and sides were deeply covered. As we passed between Cythera and the curious promontory of Onugnathos, or the Ass's Jaw, on the mainland opposite, the famous island looked grey and repulsive, and anything but a fitting home for the Goddess of Love. Here we were in comparatively calm water, but from former experience we knew what to expect on the other side of Malea, that headland so justly dreaded by the ancient sailors, as the epitaphs in the Greek Anthology can testify. Nor were we disappointed; for as soon as we had

passed the chapel of the hermit of Malea, which lies at the foot of the promontory, we were met by a furious north-east wind—the rude Kaikias of classical writers, and the Euroclydon of St. Paul's voyage—which considerably delayed our progress. Away to the south a small island (now called Cerigotto) came in sight, which forms the connecting link between Crete and Cythera; and later in the day we passed Melos, Anti-Melos, and other islands, which wore a grey, harsh, and uninviting appearance. It was midnight before we reached Syra, the great mercantile station in the middle of the Cyclades, and the best starting-point for a tour in the Greek Islands. Here I disembarked, and joined my travelling companion, Mr. Crowder, who had arrived from Athens a day or two before, bringing with him, as our dragoman, Alexandros Anemoiannea, who on various occasions had accompanied well-known travellers in Greece, as G. F. Bowen, W. G. Clark, John Stuart Mill, Dean Stanley, Sir T. Wyse, &c. The weather report from Athens told of bitter cold. The steamer which conveyed them from the Piræus to Syra had been obliged frequently to stop, owing to the danger to navigation from the thickness of the falling snow, and snow was lying in the streets at Syra. We received similar accounts from other quarters. An Armenian gentleman, who was one of my fellow passengers on the steamer, had heard before leaving England that there was deep snow at Constantinople, and that owing to the same cause the communications between that city and the interior of Asia Minor had been broken for some time. Subsequently we learnt that the weather was equally severe at Jerusalem. The prospects of our journey looked most unfavourable, for the islands cannot properly be visited except in a boat of moderate size, which admits of being rowed in a calm; and such a mode of locomotion would have been impracticable in such an inclement season.

The next morning, however, as if by magic, all this was changed. The wind was from the south, soft and warm, the sky cloudless, and the sea only moved by a gentle ripple. It was a perfect Aegean spring day, the only sign of the previous bad weather being the snow which covered the tops of the loftier islands. Accordingly, we hired a boat with three men, intending to make a trial trip to Delos, Rheneia, and Tenos, and started from the mole of Syra shortly after midday. As we left the harbour, we obtained a fine view of the town, which lies on the eastern side of the island, about half-way between its northern and southern extremities. It is now called Hermopolis, and contains 30,000 inhabitants, the most conspicuous portion being the Roman Catholic quarter, which rises steeply up the sides of a conical hill; this was the old town of Syra, whereas the new town, which spreads from the foot of this to the sea, and is the busiest of Oriental stations, has sprung up along with the commercial activity of the place. No trees were to be seen, except a few cypresses, the greater part of the ground being uncultivated, though vineyards appeared here and there, and a great quantity of tomatos are grown. Still the stony mountain-sides have a certain beauty, owing to the extreme clearness of the air, and the contrast afforded by the wonderful blue of the sky. Passing the island of Gaidaro, or "The Donkey," one of two rocky islets which lie off the harbour, and in ancient times were called Didymæ, or "The Twins," we gradually saw the Cyclades open out before us. Rheneia lay due east of us, concealing Delos entirely, while Myconos rose above and beyond its northern end; these, together with Tenos, are visible from Syra itself. Then, as we proceeded, there appeared on the left hand, first Andros, which seems a continuation of Tenos, the narrow strait that separates them being indistinguishable; then the promontory of Geraestus in Euboea; and at last Gyara, the Botany Bay of the Romans, nearer at hand, and half hidden by a corner of Syra; on the right, lying along the

thern horizon, Naxos, Paros, Antiparos, Siphnos, Seriphos. It was an admirable island view to commence with, and it was easy to distinguish the highest points by the amount of snow which they bore: far the greatest quantity lay on the north of Euboea, next after which came Andros, and then Naxos, while on the rest none was visible. The forms were broken and yet graceful, and the afternoon sun brought out the beautiful shadows on the mountain sides which are so familiar to the traveller in Greece. The general aspect of the islands, especially the more distant ones, is that of long lines on the surface of the sea. The length of Naxos is very conspicuous, notwithstanding its lofty mountains, while Paros presents a single low pyramid, bearing a striking resemblance to the other great source of white marble, Pentelicus. Tenos is distinguished by its numerous white villages which stud its sides, while behind the town of Tenos itself, on the summit of the ridge, there rises a remarkable knob of rock, faced with red: with this we were destined to make further acquaintance. The picturesque of the whole scene was enhanced by numerous white sails dotting the blue sea, and an atmospheric illusion, which lifted the islands out of the water.

We had steered a little south of east, and in about four hours found ourselves rounding the northernmost point of Rheneia; from hence the long soft line of Ios was visible between Naxos and Paros on the horizon. The cape is formed of great masses of granite, curiously honeycombed, and we subsequently discovered that both this land and the sister isle of Delos are entirely composed of this kind of stone, which is not the case with most of the other Aegean islands; consequently, while the houses of the town of Delos are of granite, as we see from their remains, the materials for most of the public buildings were imported. The two islands are now called the Greater and the Lesser Deli, and run due north and south, divided by a strait about half a mile in breadth, which forms a beautiful harbour, with deep water, and sheltered from every wind. There can be little doubt that it was to this feature that Delos originally owed its greatness, for it was the first place where persons could anchor in coming from the east, and thus became a natural resort for traders. Rowing up this channel, at the narrowest point we came to an island in mid-stream, now called Rheumatari or Stream-island, which in ancient times was named the Island of Hecate. It is highly probable that it was here that Polyrates threw across the chain, by which he attached Rheneia to Delos, in token of its being dedicated to Apollo; and that Nicias when sent from Athens as the leader of a festival procession, having brought a bridge from Athens to Rheneia, and laid it in the night-time, proceeded to the temple on the morrow with triumphal pomp. Directly to the east of this rises Mount Cynthus, the highest point in Delos, and in a valley which descends almost from its summit towards the strait in a south-westerly direction is the bed of a stream, the ancient Inopus, which had a legendary connexion with the Nile, for Callimachus says that it was fullest when that river is flooded. Possibly the link of connexion may be found in a temple of Isis on the mountain side. Passing the island of Hecate, we landed on Delos, near where another small island, the lesser Rheumatari, lies off the coast; here there were traces of quays, but the sea has retired and left a sandy beach. Within a gunshot of this point the ruins of the great temple of Apollo were plainly visible, forming a vast heap of fallen blocks of white marble; but we refrained for the moment from visiting these, our object being to ascend Cynthus before night-fall. Making our way through aromatic brushwood of lentisk and cistus, we directed our steps towards a white wall, conspicuous from below, which proved to belong to a theatre, the *cavea* of which faces west, and is clearly traceable, the back part being excavated in the hill side, while

the ends are composed of masonry of Parian marble, the courses, of which in one place thirteen remain, being skilfully put together, though somewhat narrow. The line of the *scenae* also is well marked. Behind this, and further up the hill side, stood the small temple of Isis already referred to, the foundations of which have been excavated, and show that it was of white marble; the *pronaos*, *naos*, and an altar were visible, together with a mosaic pavement composed of pebbles; its dedication is proved by an inscription found there. In the neighbourhood of this temple there is a curious gateway, which, when seen from a distance, resembles a cavern, but in reality is artificial, the roof being formed of two granite blocks resting against one another at an obtuse angle; the chamber to which it led, and which Leake conjectures to have been, perhaps, the treasury of Delos, is now obstructed. We then mounted by a very steep ascent to the summit of Cynthus, where are the foundations and fragments of another temple, the pillars being in the Ionic style. As this mountain is not more than 350 feet above the sea, I had often wondered how classical writers could speak of it as lofty—Aristophanes, for instance (*Nub.* 596), describes it as *Κυνθίαν ὑψηλίστην*—especially as it is surrounded by so much loftier peaks; but from its steepness and rocky character it deserves that epithet, and certainly it is very conspicuous from everywhere in the neighbouring seas. This circumstance, especially if it served as a landmark to vessels coming from the open sea, may also, perhaps, explain the origin of the name of the island, *Δήλος*, which can hardly be otherwise than of Greek origin, and yet was sufficiently strange to cause even the ancients to speak of *Δήλος ἄδηλος*. The view from this point is very fine, comprehending all the islands we have already noticed—the *Κυκλάδες*, of which Callimachus says:

Ἀστερίη θυόεσσα, σὲ μὲν περὶ τ' ἀμφὶ τε νῆσοι
κύκλον ἱποῖσαντο καὶ ὡς χορὸν ἀμφεβόλοντο

while Myconos is full in view to the north-east, separated by a strait about two miles wide. It was natural, therefore, that Virgil should represent Apollo as fastening his island to Myconos, when it ceased to wander on the sea; but what, except Roman ignorance of geography, should make him attach it also to Gyarus—*celsa Gyaro Myconoque revolvit*—I do not understand. Here, too, the character of the island is well seen—a narrow rocky ridge, between two and three miles in length, with granite knolls and barren slopes; thus justifying the story related in the Homeric Hymn to the Delian Apollo, that Latona visited all the richest spots in the Aegean before giving birth to her children; but all were afraid to receive her, so that she betook herself to the small and rugged island. As we descended on the opposite side from that by which we had approached, we met the single inhabitant of Delos, an old shepherd, who spoke a most extraordinary dialect of Greek. He did not offer to accompany us, which our guide, who was not then with us, attributed to his regarding our sudden appearance as uncanny; the next day, however, when I questioned the old man as to the existence of “Vrykolakas” or vampires in the island, he replied in the negative; at which I was surprised, for it was the neighbouring island of Myconos, about which Tournefort relates a marvellous story, of the whole population being *bouleversé* for weeks together by such an apparition. We passed the night in some deserted shepherd’s huts, lying in a depression to the north of Cynthus, where the ground slopes gradually to the two seas, and has been sown with corn by the people of Myconos: these dwellings were constructed of stones put together with straw instead of mortar, while the doors were of ancient blocks approaching one another toward the top. All around grew the spreading leaves and lilac flowers of the mandrake (*Atropa mandragora*), forming large flat patches on the ground. This excessively poisonous plant, which has been a favourite with witches in all ages, and is said to

utter shrieks when its root is extracted from the ground, is especially common in the Greek islands. In Attica bits of the root are carried by young men as amatory amulets. As I lay awake part of the night in the extraordinary stillness, I was able to recall, in some measure, the crowds of worshippers, the visit of the Persians, and other romantic glories of the place—things which it is so difficult to realise, when the senses are in contact with the material objects.

The next morning opened with rain, but it had cleared by eight o’clock, and we descended from our night’s lodging towards the landing-place where we had left our boat. As we approached the sea, the northernmost ruins that we met with were those of the ancient city, where granite columns were lying among broken fragments of walls. Beyond this was an oval basin, about 100 yards in length, forming a kind of pond, the sides of which were banked in by a casing of stonework; it is usually dry, but at this season contained a small quantity of water. In ancient times it was full, and was called the Circular Lake (*τροχαιοδὴς λίμνη*, Herod. ii. 170). If, as we are told by Theognis (?), it was near this lake that Latona brought forth her two children, then the famous palm-tree of Delos, which is mentioned in Homer (*Od.* vi. 162), where Ulysses compares Nausicaa’s beauty to it, must have stood here, for we are told in the Hymn to the Delian Apollo (117) that the goddess clasped it when in the pains of childbirth; though Callimachus has followed another version of the story, when he places that occurrence on the banks of the Inopus (*Del.* 206). Near this basin is the only good spring of water in the island, and this circumstance probably determined the position of the temple of Apollo. The *temenos* of this is hard by to the south, and within it the ruins of the temple form a confused heap of white marble fragments, columns, bases, and entablatures lying indiscriminately together. They are of the Doric order, and as many of the shafts are only partly fluted, it would seem that the details of the building were never completely finished. The wreck of so fine a specimen of architecture is a sad sight; but when we consider that the place has served for a quarry for the neighbouring islanders, and a place of pillage for foreigners from the times of the Venetian occupation to our own days, perhaps the wonder is rather that so much remains. In the south-west part of the area is a large square marble basis, hollowed out in the middle, with the remains of an inscription on one side *ΝΑΞΙΟΙ ΑΙΙΘΑΛΩΝΙ*: this supported a colossus, which was overthrown in ancient times by the falling of a palm-tree of bronze gilt, erected by Nicias in its immediate neighbourhood (Plutarch, *Nic.* 3). When Spon and Wheeler visited this island in 1675, the statue remained with the exception of its head, and part of the torso, from the neck to the waist, has been seen within the present half century, but we could find no traces of it. A portion of the ruins in the temple area towards the coast, which are in the Corinthian style, seem to have belonged to an entrance colonnade to the *temenos*; and not far off, on the other side of a wall constructed by the shepherds, are the prostrate columns of another portico, built by Philip V. of Macedon. In Spon’s time eleven of these were standing, but without capitals. In the midst of the ruins, anemones of various colours—white, pink, and lilac—were growing, and I dug up some fine narcissus roots to transplant to England. Our guide informed me that J. S. Mill, when he travelled with him in the Peloponnese, besides drying flowers, had an extra baggage mule in his train for carrying plants and roots.

Embarking once more, we crossed the strait, and landed on Rheneia, at a point somewhat south of the island of Hecate. Both Rheneia and its sister island are absolutely bare of trees. At a little distance from this point, on the slopes which rise above the strait, is an ancient necropolis, containing the graves of those whose bodies were removed from Delos at the time of the Peloponne-

sian war. It extends over half a mile, and is a scene of wild desolation, worthy of the circle of the *Inferno* in which Farinata's spirit emerged from its fiery tomb. Broken stones lay strewn about in all directions, mixed here and there with sides and lids of sarcophagi. Usually the graves are only distinguishable by depressions in the ground, but in some places the areas and walls are traceable. About them were growing the coarse branching stems of the asphodel, a most disenchanting plant, and so rough, that if the lotus-eaters enjoyed lying among them, they did not indulge in Sybarite tastes. When we returned to our boat we found the sailors eating raw limpets, which they picked from the rocks. It was now the Greek Lent, which is observed with great strictness by all the sailors in the Aegean, but bloodless fish are allowed to be eaten.

CORRESPONDENCE.

THE "QUARTERLY REVIEW" AND MR. DARWIN.

Jan. 13, 1875.

It was with no slight astonishment that I read the objection made in your last number to my intimation that Mr. Darwin had, in fact, deliberately kept back, when he published his *Origin of Species*, any explicit declaration of his views as to the bestiality of man, in order the better to disseminate his notions by disguising them (through such studious reticence) from the less clear-sighted.

My astonishment was great for two reasons. First, because a statement to the same effect had appeared as much as three years earlier,* and, as far

* "In his earlier writings a certain reticence veiled, though it did not hide, his ultimate conclu-

as I recollect, passed unchallenged, in spite of the criticism to which the article referred to was subjected. Secondly, because both these statements simply reposed upon what Mr. Darwin himself had expressly said, and, after all, he must have known his own meaning and intentions better than even the most eager of his disciples.

His words in the introduction to his *Descent of Man* (words referring to his conduct and motives in earlier publications), stand as follows:—

"During many years I collected notes on the origin and descent of man, without any intention of publishing on the subject, but rather with the determination not to publish, as I thought that I should thus only add to the prejudices against my views."

If this does not denote deliberate and intentional "reticence," it is to me unintelligible.

Everyone who recollects the earlier stages of the controversy must remember that Mr. Darwin was often excused or defended on the plea that he might not really mean to include man. Moreover he was *rightly* so defended, for however little obscure might be his real meaning to the more clear-sighted and to his personal friends, there is, so far as I know, nothing in the *Origin of Species*, and certainly nothing in the passages quoted from it in your last number, which need have hindered the innocent or more kindly disposed from believing that Mr. Darwin appreciated "reason" at its just value, and therefore, like Mr. Wallace, Professor Max Müller, and the author of the *Genesis of Species*, made rational man an exception to the general process of evolution.

Mr. Darwin proceeds (in the passage quoted) to say: "It seemed to me sufficient to indicate, in the first edition of my *Origin of Species*, that by this work" light would be thrown on the origin of man and his history; "and this implies that man must be included with other organic beings in any general conclusions respecting his manner of appearance on this earth."

And so it was sufficient for some purposes: sufficient to reveal his meaning to those who could divine his psychological views, sufficient also to secure the zealous aid of those eager to prove man to be in nature, as in end, like "the beasts which perish," without at the same time stimulating opposition, as it would have been stimulated had he plainly and unmistakably stated at first his views and conclusions as to man.

As to Mr. George Darwin, I gladly avail myself of this opportunity of repeating, what has already been stated by the *Quarterly Review* for October, that however I may have misunderstood him, nothing could have been further from my intention than the wish to insinuate anything against Mr. G. Darwin personally. It never occurred to me as possible, when the passage was written, that it could be taken as casting any slur of the kind. Had it so occurred to me, it would most assuredly never have appeared. Nor do I hesitate to avow my great regret for not having more carefully guarded against any such possible misapprehension. THE QUARTERLY REVIEWER OF 1874.

CAPTAIN HOFFMEYER'S CHARTS OF THE WEATHER.

Meteorological Office: January 12, 1875.

I have the honour to inform you that the issue of Captain Hoffmeyer's daily charts of the weather from 60° E. to 60° W. longitude, and from 30° to 75° N. latitude, for the three months of last winter, are now complete.

Captain Hoffmeyer is anxious to know what chance there is of his being able to continue the publication. The number of copies already sold of the existing charts has not been sufficient to cover the expenses of production.

sions as to the origin of our own species." . . . "What was obscurely hinted in the *Origin of Species* is here fully and fairly stated in all its bearings and without disguise."—Review of the *Descent of Man* in the *Quarterly Review* for July, 1871, p. 47.

At the same time this office has found that the rate of subscription (11s. per quarter) which it charges has fallen short of the cost, carriage, and postage of the existing chart.

I have, therefore, to request any gentlemen who are willing to subscribe to a future issue of the charts to send in their names to me as soon as convenient. The rate of subscription will be at least 12s. 6d. per quarter, and must necessarily be higher if the original cost of the charts at Copenhagen is raised above the price first named—viz., 4 francs per month.

ROBERT H. SCOTT, Director.

STATUE OF KING ROBERT THE BRUCE AT STIRLING CASTLE.

Westerton, Bridge of Allan, N.B.: Jan. 10, 1875.

In the paper of yesterday Mr. William B. Scott, of Bellevue, Chelsea, states that he was applied to for a subscription to the bronze statue of the Patriot King—Robert the Bruce—which it is proposed to place on the esplanade of Stirling Castle, where it will be seen by thousands of visitors to the ancient Capitol of Scotland. Mr. Scott adds, "the designer (or sculptor) seems to be Mr. George Cruikshank," and enquires if this is the well-known caricaturist of veteran years.

Mr. Cruikshank is the eminent artist, now an octogenarian, the great promoter of temperance, and exhibiting in his own person the great advantages of a well-regulated life. In his youth he was a comic draughtsman, and in his mature years by illustrations of the evil effects of "The Bottle," he has done an immensity of good.

His design for "The Bruce" is excellent, in chain armour, and sheathing his sword after his crowning victory of Bannockburn, while on the granite pedestal are the hands of those who lately were foes now joined in friendship.

It is hoped that patriotic Scotchmen and all admirers of the heroic king will assist the committee to perpetuate and honour his memory by means of this statue.

J. E. ALEXANDER, Major-General.
Chairman of Committee.

BLAKE'S ETCHINGS.

69 Lancaster Gate, Hyde Park, W.:
January 9, 1875.

In the course of working at William Blake's *Prophecies*, I have come across two facts which may interest your readers.

1st. The well-known figure of Nebuchadnezzar in *The Marriage of Heaven and Hell* is without doubt derived from Plate 146 of *The Bible Commentary* (Richard Blome, 1703), which was probably drawn by G. Freeman and engraved by some Dutch or Flemish engraver, as is the case with most of the plates in the same volume. This fact appears to me interesting, as I know of no other instance in which Blake has borrowed an attitude or idea.

2nd. Many catalogues of Wm. Blake's works put down *The Song of Los* (Africa and Asia), 1795, and omit *The Book of Los* of the same year. The "Song" completes the "America" ('93) and "Europe" ('94) series, while the "Book" belongs to the "Urizen" ('94) series.

The *Book of Los* is in the British Museum; it is etched, not printed in Blake's usual way. It contains only three plates of text, a frontispiece, and vignette.

FREDK. YORK POWELL.

THE URARI POISON.

Museum, Kent: Jan. 11, 1875.

The quotation at page 23 of the *ACADEMY* for January 2, from the *Japan Herald*, relating to the Urari poison of South America, seems to require some further explanation. I have not seen the original article referred to, but the Urari poison of Guiana is no new discovery. Sir Walter Raleigh, to whom so many wonderful discoveries have been attributed, is said to have been the first person to

bring to Europe any trustworthy information on the uses and virulence of the poison. The early accounts contained a good deal that was fabulous and mysterious, and even up to recent times the manufacturers of the poison impart a good deal of mystery to its preparation.

At the beginning of the present century Humboldt gave an account of its preparation as witnessed by him on the Upper Orinoko, but it was reserved to Sir Robert Schomburgk to obtain and publish the fullest information regarding it. With great difficulty he obtained from the natives specimens of the Ourari tree, from which it proved to be a species of *Strychnos*—namely, *Strychnos torifera*, Schomb. In its preparation, which Sir Robert had much difficulty in prevailing upon the natives to allow him to witness—several other ingredients were used besides the bark of the *Strychnos* itself. Indeed, there seems to be no absolute rule as to its manufacture holding good throughout the country where it is used; but each tribe appears to have its own recipe and to use different ingredients. That prepared by the Macusi Indians, however, has the greatest reputation; so much so, indeed, that whole caravans of Indians come from the surrounding States to exchange other articles for it.

As to "incautious handling" of the juice producing "external eruptions on the body, face," &c., it is well known to the natives as well as to toxicologists generally, as proved by experiments made by Professors Virchow and Münter, "that urari by external application is not fatal, but only when it is absorbed by the living animal substance through an incision made in the same." Numerous experiments are recorded of very rapid death after the poison had once touched a wound; but, taken inwardly in very small doses, it has no serious effect. Indeed, the natives, when using it, are said to habitually suck their fingers to remove any that may have attached itself. In larger doses, however, taken inwardly, the urari has proved fatal, so that the statement in the *Japan Herald* that "the antidote lies in the bane itself" ought to be thoroughly considered and practised with caution.

That the *Strychnos torifera* should yield a varnish equal to that of the Japanese *Rhus* is something quite new, and seems to require further confirmation. It is not in the nature of the Apocynaceae to furnish such a product. Many of them yield a milky juice which is mostly acrid and poisonous, but in some it is perfectly harmless and sufficiently bland to be used as food.

JOHN R. JACKSON.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Jan. 16,	1 p.m.	Sale at Christie's of the Works of the late J. G. Middleton.
	2 p.m.	Mr. and Mrs. Kendal in <i>The Lady of Lyons</i> at the Gaiety.
	3 p.m.	Crystal Palace Concert (Mr. Oscar Beringer).
	"	Saturday Popular Concert, St. James's Hall (Mlle. Marie Krebe).
MONDAY, Jan. 18,	8 p.m.	First night of <i>Our Boys</i> at the Vaudeville.
	3 p.m.	Asiatic: Professor J. Dawson on "Two Bactrian Pali Inscriptions."
	5 p.m.	London Institution: Mr. Armytage Bakewell on "Cremation."
	8 p.m.	British Architects: Medical.
TUESDAY, Jan. 19,	"	Monday Popular Concert, St. James's Hall (Mendelssohn Night).
	"	Society of Arts: Cantor Lecture IV.
	3 p.m.	Royal Institution: Mr. E. Ray Lankester on "The Pedigree of the Animal Kingdom."
	7.45 p.m.	Statistical.
WEDNESDAY, Jan. 20,	8 p.m.	Civil Engineers: Pathological.
	"	Society of Arts.
	8.30 p.m.	Zoological.
	1 p.m.	Horticultural.
THURSDAY, Jan. 21,	7 p.m.	Meteorological: Anniversary.
	8 p.m.	Society of Arts.
	3 p.m.	Royal Institution: Professor P. M. Duncan on "The Grand Phenomena of Physical Geography."
	4 p.m.	Zoological.
	6.30 p.m.	Royal Society Club.

THURSDAY, Jan. 21,	7 p.m.	Numismatic.
	"	London Institution: Professor Rolleston on "The Early Inhabitants of England." II.
	8 p.m.	Linnean.
	"	Royal Albert Hall Concert (Herr Wilhelm).
FRIDAY, Jan. 22,	8.30 p.m.	Royal. Antiquaries.
	8 p.m.	Royal Institution: Weekly Evening Meeting. 9 p.m. Sir J. Lubbock on "Wild Flowers and Insects."
	"	Quekett Club.
	"	Society of Arts: Indian Section; Opening Address by Sir G. Campbell.
	8.30 p.m.	Clinical.

SCIENCE.

Supplement to Harvesting Ants and Trap-door Spiders. By J. Traherne Moggridge, F.L.S., F.Z.S. With Specific Descriptions of the Spiders, by the Rev. O. Picard-Cambridge. (London: L. Reeve & Co., 1874.)

OUR readers will welcome with sincere pleasure the *Supplement to Harvesting Ants and Trap-door Spiders*; but this pleasure will be mingled with deep regret in that so careful and conscientious an observer is now lost to us. In this, his last work, he has supplemented his previous observations by others equally interesting; also intended, as he says in his touching preface, to induce "my readers to take part with me in my pleasure and pursuits, so that we should from that time work together."

It is to be hoped that the labours of this lamented naturalist may encourage others to emulate his example, and that thus clearer light may be thrown upon the hitherto scarcely understood habits of the Arachnidae and those of the Formicidae, which, in spite of the labours of Gould, Huber, Mayr, Ebrard, Forel, and other naturalists, still offer a rich field for investigation.

The dissimilarity of different species of ants, as regards strength, speed, nocturnal, diurnal, and various other habits, as well as the varying date of departure of winged ants from the nest, and the different nature of their food, appear sufficiently to account for the co-existence of several species in a limited area.

Some surprise is expressed by the author that the winged ants, about to leave the nest, should be so carefully guarded by the workers; but the fact is that the winged ants have no sting, and are consequently powerless to defend themselves, while the large jaws of the workers render them formidable champions.

Reflections have been thrown upon Solomon's knowledge of Natural History, inasmuch as he represents the ant as "storing up" for herself: this not being the case with any of our northern ants, so far as we know at present. But, as Mr. Gould wisely suggests, in his *Account of English Ants*, 1747, "the difference of Climates might occasion a different Management. In warmer Regions the Weather is more favourable, and Seasons less severe; therefore Ants may not undergo that Chill which they do in England." Mr. Moggridge has shown that this suggestion of the old English naturalist is perfectly correct, and that some of the southern species do, in the words of Solomon, "provide their meat in the summer, and gather their food in the harvest."

It is a curious fact, that in the first section of the *Mishna*, called the *Zeraim*, mention is made of the granaries of harvesting ants, and special laws are laid down as to the distribution of the grain found in these repositories, clearly showing that the quantity must usually have been considerable. In this distribution, however, I regret to observe that no portion seems to have been allotted to the industrious little insects to whose labour this accumulation of seeds was owing.

But, Mr. Moggridge considers, though the nests observed by him contained on an average sixteen ounces of grain, still, as each granary held but an insignificant quantity, and the store chambers often lay far apart, it is impossible not to believe that those alluded to in the *Mishna* must have been larger and more accessible; they would not otherwise have been deemed worthy of legislative notice. As regards the means employed by ants to prevent the germination of stored-up seeds, these yet remain a secret, and may bear some analogy to the curious instinct which leads *Cerceris* to keep the larvae fresh and good on which her young ones will feed on quitting the egg. With her, however, one operation is sufficient; whereas it appears that the constant presence of ants is necessary to prevent the germination of the granaried seeds. Some Indian ants, on the approach of wet weather, have a peculiar habit of bringing out in heaps the seeds which they have laboriously collected, most of these being then devoured by birds. The author considers that this may be owing to the fact that it would be impossible, during the rainy season, to prevent germination, and even perhaps that a certain number of seeds might spring up and afford to the ants an easy and accessible harvest.

In a certain part of India a kind of adoration is paid to ants, which Mr. Moggridge thinks may have had its origin in a sentiment of combined fear and admiration. And, he says, this is suggested by an Arabian custom of placing an ant in the hand of a new-born child, in order that its virtues may pass into and possess the infant. It is curious to see the analogy between this notion and that of those savage tribes who, in feasting upon a dead hero, imagine themselves to become imbued with his strength and courage, as well, of course, as with that of all the other warriors whom he might previously have eaten.

The question of the domestic animals employed by ants, as also of the various creatures, beetles, crickets, &c., which they keep in their nests for no ostensible purpose, tend with great care, and hasten to rescue at the first approach of danger, is one of great difficulty and interest.

Even less is known of the habits of the Trap-door Spider than of those of the Harvesting Ant. Six kinds only, not including *Atypus*, of the trap-door nest, have as yet been described. With regard to *Atypus*, it seems an undecided point as to whether it forms one or several species; and how, if it feeds on worms, it can contrive to catch them in the long tube which it spins, closing it at one end. Mr. Moggridge strongly recommends visitors to the sandy banks of St. Leonard's, the fir woods of Bournemouth,

or the deep lanes at Torquay, to study the habits of this interesting creature.

Among the trap-door spiders mostly observed by Mr. Moggridge, he found that the *débris* of their food chiefly consisted of the horny coats of ants; the nests being sometimes plunged into the midst of the colony of ants, and most carefully concealed, with an opening only at the top; "this perfect concealment," he says, "being of essential importance to the spiders' success in life, for if they once alarmed the whole colony of ants, and let them know the exact whereabouts of their lurking place, they would soon learn to avoid it," even perhaps to attack and destroy their enemy. In conclusion, it only remains to say that the illustrations are both numerous and excellent, and that there are in this little work good and useful specific descriptions of the spiders, by the Rev. O. Pickard-Cambridge. We can thoroughly recommend the book to our readers.

ELLEN FRANCES LUBBOCK.

Horae Hellenicae: Essays and Discussions on some Important Points of Greek Philology and Antiquity. By Professor Blackie. (London: Macmillan & Co., 1874.)

THE eleven essays reprinted in this volume might, perhaps, conveniently be classified under three heads. I. *Philosophy and History*:—1. "On the Theology of Homer;" 2. "On the Scientific Interpretation of Popular Myths with special reference to Greek Mythology;" 3. "On the Sophists of the Fifth Century B.C.;" 4. "On the Pre-Socratic Philosophy;" 5. "On the Spartan Constitution and the Agrarian Laws of Lycurgus." II. *Literary Criticism*:—1. "On the 'Prometheus Bound' of Aeschylus;" 2. "On the Popular Poetry of Modern Greece;" 3. "Remarks on English Hexameters." III. *Philology and Grammar*:—1. "On the Philological Genius and Character of the Neo-Hellenic Dialect of the Greek Tongue;" 2. "On Onomatopoeia in Language;" 3. "On the Place and Power of Accent in Language." In treating, within narrow limits, a collection of papers at once so miscellaneous and severally so elaborate, we can at most hope to do two things—to indicate the distinctive marks of the volume as a whole, and to draw attention to a few topics of which the treatment appears especially worthy of notice. Now, the great characteristic of Professor Blackie as a scholar, the characteristic which sets its impress on this volume as on everything else that he has written, is that for him the language and the literature of ancient Greece are *living*. His study of them has not been arrested by any arbitrary or conventional limit of classicism, but has been carried on, and has been applied with the same eagerness, to the language and to the thought of modern Greece, while it has been illustrated, with all the brightness of a mind ingenious to a fault, from the resources of a remarkably wide and philosophical culture. Those Dialogues in classical Greek by which Professor Blackie has striven to make the language more present, more real to students of to-day, perfectly express the distinctive bent of his genius as a scholar; and, though there may be room for doubting whether the

ordinary sympathy with Sophocles will be quickened by knowing that, if a Periclean Greek had meant "Let the clergyman say grace," he *might* have said *ὁ τὸ μέλαν φορῶν εὐλογεῖτω*, yet, on the whole, this essential vivacity, this spirited resolve that his chosen study shall be living and not dead, which is Professor Blackie's great characteristic, is admirable, and in England is precious. Whatever in Professor Blackie's style occasionally offends against the sense of just measure, is due to this exuberance of vitality; and is, properly speaking, less grotesque than dionysiac. If, after the example of the Dialogues just mentioned, it is lawful to conjecture what Pericles would have said of Professor Blackie in such instances, it seems conceivable that Pericles might have tempered praise and remonstrance in fit proportions by saying, *ὁ ἀνὴρ νεανιεύεται*.

Perhaps of all these essays one of the ablest, the most complete, and the most suggestive is that on the philological character of the Modern Greek language and its relation to Old Greek (pp. 111–166). The origin and development of the Neo-Hellenic dialect is traced from the twelfth century—where two short poems, addressed by a Byzantine monk to the Emperor Manuel in 1143, already attest a popular language of the illiterate masses existing side by side with the traditional literary and ecclesiastical idiom—down to the time when the learning and patriotism of Adamantine Koraes, stimulated by the influences of the French Revolution, finally established this popular language as a definite and substantive type. But at the outset the question arises—Can this Neo-Hellenic language be properly called a *dialect* of the language in which Plato wrote? Professor Blackie's statement of the difference between a new language and a new dialect is at least practically adequate:—

"Whenever the old materials of a language are so modified as that only a very few words remain in their original form, and that more accidentally than systematically, and when the obscurity arising from this source is increased by the admixture, in larger or smaller quantity, of foreign materials, in this case, as in the case of Spanish and Italian, a new language has been created. But whenever the changes induced on the old materials are comparatively slight, and more sporadic than penetrating and pervading in their character, with only a very spare admixture of foreign materials, in this case we shall have only a new *dialect*—not a new *language*."

As the standard of Modern Greek, for the purposes of a philological investigation, Professor Blackie has sought a book written for general circulation before the process of purification and restoration instituted by Koraes had removed some marks of origin and growth; and his choice has fallen on a translation of the *Arabian Nights* into Modern Greek, published at Venice in 1792. After some useful remarks on the necessity of distinguishing corruption from development—a language is corrupted when it forsakes its natural analogies, as in *μαθαίνω* for *μανθάνω*, not when it puts forth new forms agreeable to them, as *ταχινός* and *βρωμερός* by the side of *ταχύς* and *βρωμύδης*—Professor Blackie enters on a detailed comparison of modern with ancient Greek. The results of his analysis might be arranged

under the two heads of word-lore and syntax. I. Under the first we have:—(1) Change and extension in the usage of particular words: e.g., *σηκώνω*, "to weigh," now means "to raise." The whole list of examples is very interesting. (2) Growth of new terminations to old roots: e.g., *ἀρχίζω*, *δακρύζω*. (3) Growth of new compound verbs: e.g., *ψυχοπονέω*, "to sympathise." (4) Curtailment of words; and this in seven principal cases: (i.) suppression of a short initial vowel, as *λίγος* for *ὀλίγος*, or of an unaccented initial diphthong, as *μαπός* for *αἰμαπός*, *δέν* for *οὐδέν*, or a whole initial syllable, as *δάσκαλος* for *διδύσκαλος*: (ii.) suppression of a final *ν*, as *καλό* for *καλόν*, or of the final *-ον* of diminutives, as *παιδί* for *παιδίον*: (iii.) suppression of both initial and final syllables, as *μάτι* for *ὀμματίον*: (iv.) curtailments of the verb, as *βλάψα* for *ἔβλαψα*, *γραμμένος* for *γεγραμμένος*, *ἐλευθερωθῇ* for *ἐλευθερωθήναι*, *γράφει* for *γράφειν*: (v.) absorption of the preposition into the definite article, as, for *εἰς τὴν πόλιν*, *στην πόλιν*, Dorice *στανπόλιν*—whence *Stamboul*: (vi.) syncope or synizesis, as *σπίθη* for *σπινθήρ*, *συβάω* for *συμβιβάζω*: (vii.) crasis, as *ἵνα ἔσαι*, *πῶρχεται* for *ὅπου ἔρχεται*. (5) Regular substitution of the diminutive for the simple word; as *ποτάμι* (*ποτάμιον*), *γεροντάκι* (*γεροντάκιον*), &c.—a tendency already manifest in the classical language—e.g. *θηρίον*, *πεδίον*: cf. *oculus*. (6) Lengthening of words, (i.) by the addition of a letter or syllable, either initial ("prosthetic") or final ("paragogic"): e.g. *ἰσικιον* for *σκιά*, *τότες* for *τότε*; (ii.) by the insertion of *γ*, as *ἀγοῦρος* for *ἄωρος*: (iii.) in verbs, by the insertion of *ν* in the pres. indic., as *φέρνω* for *φέρω*, or the addition of *κα* to the 1st aor. pass., as *ἐγράφθηκα* for *ἐγράφθην*. (7) Tendency to abolish anomalies, and to return to the natural analogies of the language; e.g., *ἔφερθην* as 1st aor. pass. of *φέρω*—a tendency seen most strongly in the abolition of verbs in *μι*—thus *δίδω* for *δίδωμι*, &c. II. Under the second head—Syntax—we have: (1) Abridgment of the verbal system, by (i.) loss of the optative, of which the work is done by the conjunctive: (ii.) loss of the infinitive, leading to constructions such as *διὰ τὸ να πραχθῶσι ταῦτα* for *πραχθῆναι ταῦτα*, of which Professor Blackie excuses the clumsiness by our "on account of the fact that," and the Latin *propterea quod*: (iii.) loss of the future, which is formed with the help of *θέλω* or *θά*: (iv.) loss of the pluperf., which is formed with *ἔχω*. (2) Disappearance of the dative case: (3) Frequent substitution for the relative *ὅς* of *ὁ ὁποῖος* (*il quale*). (4) Confusion of *ὡς ἂν* or *σάν* with the simple *ὡς*, "as." (5) Formation of new prepositions or adverbs, as *συμμά*, "near," *τά ἰσία*=*αὐτίκα*, &c. As to Modern Greek pronunciation, Professor Blackie observes that the classical accent usually keeps its place, though quantity is usually ignored and the vocalisation is corrupted by itacism, especially in regard to *η* and *υ*. Lord Strangford said of Modern Greek that it would be easy to show two Ionisms for one Aeolism or Dorism. Professor Blackie is of a different opinion—holding that the character of the modern language is, on the whole, Aeolo-Doric. As Doric marks, he points to the frequent broad *a* (e.g., *ζητᾶ* for *ζητεῖ*,

φοβῆται for φοβεῖται), and to the formation of futures in ξ from a present in ζ, not σσ, e.g., *ράζω*, not *ράσσω*; again, the future of *πομάζω* becomes *πομάξω*, &c. As an Aeolic mark, he instances the accus. plur. of 1st decl. in α, not ᾱ, as *Μούσαις* for *Μούσας*.

Grotians and pre-Grotians are no longer the ultimate elements of opinion about the Sophists; "reactions" and subtle counter-reactions have given the controversy a sort of new life lately. Professor Blackie adheres, on the whole, to the pre-Grotian view as set forth by Brucker and Gillies. We wish that we had space to discuss his essay in detail; as it is, we must be content to observe that he seems to us somewhat unduly to extenuate Hegel's appreciation (p. 204) of what was good in the Sophists' work; that the severest things in the passage from the *κατὰ σοφιστῶν*, quoted at p. 210, are meant, as is clear from other places in Isocrates, for the Socratics; and that, in the *Journal of Philology*, No. 8 (1872), he will find a reassertion of Grote's view by Mr. H. Sidgwick, in which the utter vagueness of the name of "sophist" is deduced from the reciprocal usage of the word by those whom we call "sophists" and those whom we call "philosophers." Isocrates is *one* type of "sophist" for Plato, and Plato is *one* type of sophist for Isocrates.

The essay "On the Place and Power of Accent in Language" is important, and the subject is one on which the essayist speaks with the double authority of learning and of experiment. The substance of seventy-four pages may perhaps be briefly given thus:—The four affections of articulated sound are (1) volume, (2) stress, (3) pitch, (4) quantity—i.e., duration in time. Accent must always depend on (2) or (3), or both; it has nothing to do with (1) and (4). Greek accent, says Professor Blackie, depends on *both* (2) and (3). "It does not mean elevation of the voice merely, but also, and at the same time, that greater stretch or tension of the voice which produces the emphatic syllable of a word" (p. 345): i.e., it means pitch *plus* stress. The view of Mr. Munro and of Mr. W. G. Clark, whom Professor Blackie controverts, is that the classical Greek accent meant pitch *without* stress; that, in classical verse, metre was determined by quantity alone; but that, by some process, which cannot now be explained, the classical pitch-accent became in later times a stress-accent. One principal question is, how was accent reconciled with quantity in reciting Greek verse? The believers in the pitch-accent are content to say that we do not exactly know, and that, if we did, we probably could not reproduce the effect. Professor Blackie offers this definite solution:—There are two sorts of accent; the accent of spoken language, and the accent (or rhythmical beat) of music. Greek poetry, made to be sung, was governed primarily by quantity, but had also its accent, this accent being, however, the musical, not the colloquial, accent. "Here, therefore," says Professor Blackie, "the Gordian knot is untied." Shall we be pardoned if we venture to think that the Gordian knot has rather been treated as it is said to have been treated by an earlier ex-

pert in heroic measures? The solution is virtually this—that accent, properly so called, was, in classical Greek verse, ignored. While speaking of accents, we may observe that Professor Blackie comments on the euphony of the oxytone accent in Greek; and that *δύνατοι* (p. 213), and *σκία* (p. 140), might with advantage be restored to their proper function of illustrating it.

Selections from a volume of such various contents cannot be specimens; and for much which we have been obliged to leave untouched, readers are referred to a collection of essays replete with interest for every student of Greek philology. R. C. JEBB.

SCIENCE NOTES.

PHYSIOLOGY.

THE *Journal of Anatomy and Physiology* for November 1874 is perhaps overweighed with purely anatomical matter. The longest paper is one by Professor Struthers on "Variations in the Vertebrae and Ribs in Man;" in connexion with the same subject, Dr. Goodhart describes three cases of malformation of the spinal column. Professor Watson continues his contributions to the anatomy of the Indian elephant. Mr. J. C. Galton furnishes a note on the Epitrochleo-ancoheus muscle, by way of supplement to Wenzel Gruber's monograph on this subject. He regards this muscular anomaly in man as a "functionally useless heirloom, which has descended to us from very remote ancestors;" for, very constantly found in the Edentata, and present in both genera of Monotremes, it becomes gradually less frequent as we ascend the Mammalian scale, and disappears altogether—as a normal constituent of the muscular system—in the anthropoid apes. Dr. Ransome publishes a series of careful measurements, showing the variations in position of the heart's impulse determined by changes of posture. Perhaps the most readable paper is one by the Dean of Clonfert, who handles the well-worn topic of correlation between cerebral development and reasoning power in mammals in a somewhat novel way. He distinguishes three principal stages in the progressive evolution of the reasoning faculty: the first, exemplified in rodents, is the power of distinctly conceiving any particular act on which the animal may be engaged, coupled with inability to realise simultaneously the position of that act in the chain of steps leading to a desired end; the second, as shown by the dog and other carnivora, includes the power of thinking of a particular act with purpose as part of a series leading up to a given object; the third, manifested by the higher apes, is the power of thinking a fact as a case of a general principle. These three stages he believes to stand in an intimate relation to the development of the three cerebral lobes: the anterior lobe serving to "think single objects of sense;" the middle lobe to "think such objects with a sense of a succession of them and as part of that succession;" while the posterior lobe, which makes its first appearance in the monkey tribe, has for its main function "the act of thinking a co-existence or succession of objects as a case of a general principle." The very ingenuity of this hypothesis makes it seem rather premature. The dearth of experimental data concerning the mental processes of even our domestic animals is very singular; our knowledge consisting mainly of anecdotes, to judge of whose relative credibility demands an uncommon refinement of the critical sense. The number concludes with the usual copious and well-arranged Reports on the Progress of Anatomy and Physiology.

Localisation of Function in the Brain.—Nothnagel (*Virchow's Archiv*, lxi. 2) continues his studies in cerebral physiology with an account of experiments on the function of the optic thalami

in rabbits. Finding the method he had previously adopted—that of destroying limited areas of brain-matter by injecting minute quantities of chromic acid—unsuitable for his present object, he had recourse to mechanical destruction of the tissue of the thalami. This was effected very completely in some instances, without causing damage to any of the neighbouring parts. The results of the total destruction of one or both optic thalami were, in the main, negative. In opposition to statements made by some of the older observers, Nothnagel found no sign of motor paralysis or of cutaneous anaesthesia. The absence of motorial disturbance is in agreement with the results obtained by Ferrier from direct electrical stimulation of the thalami. Nothnagel accordingly concludes that neither the channels along which motor impulses are conveyed from the hemispheres, nor those along which sensory impressions travel from the periphery to the seat of consciousness, traverse the organs in question. One curious phenomenon, however, was exhibited by some of the animals subjected to experiment—a phenomenon which had previously been observed to follow injury of a particular spot in the cortex. When the forepaw was stretched out, the animal made no attempt to withdraw it from its constrained position, though fully able to do so. When the lesion was bilateral this peculiarity was presented by both paws; when one-sided, only by the paw opposite to the injured thalamus. The explanation suggested by the author is that the animal retains only a very inadequate idea of the position of the extended paw, owing to impairment of one of the faculties usually grouped under the head of "muscular sense." This would lend some support to the hypothesis of Meynert, based on purely anatomical grounds, that the optic thalamus serves to discharge combined muscular movements in answer to stimuli conveyed from the sensory surfaces of the periphery, without the intervention of consciousness. Impressions of such combined movements are transmitted from the thalami to the grey matter of the hemispheres, where they are stored up and employed as material for the subsequent volitional reproduction of such movements.

Further researches by Hitzig on the convolutions will be found by those interested in the subject in Reichert and Dubois-Reymond's *Archiv*, No. 4, for 1874. An abstract of them is furnished by Ferrier in the *Medical Record* for January 6.

Proportionate Amount of Iron in the Blood.—Picard (*Comptes Rendus*, Nov. 30, 1874) contributes the results of an enquiry conducted under the auspices of Ol. Bernard. He finds that the amount of iron in defibrinated dog's blood may vary considerably (.092 per cent. in a young, well-nourished animal; .041 in one that had been weakened by previous loss of blood). But on comparing the amount of iron contained in 100 cubic centimètres of blood with the amount of oxygen which a similar quantity of the same blood, previously saturated, may be made to yield *in vacuo*, he finds the ratio between them to be constant and equal to 2.3. The percentage of iron in the blood may thus be an index to its "respiratory capacity." He goes on to enquire whether a reserve fund of iron is contained in any of the viscera, and finds that the spleen contains upwards of .2 per cent. The liver stands next to the spleen in this respect; but it never contains a greater proportion than the blood.

Effect of Hibernation on the Composition of Organs in the Marmot.—A series of analyses on this subject are furnished by Aeby (*Archiv für experimentelle Path. und Pharmacologie*, vol. iii. part 2). Much water is lost by the blood and muscular tissue, the former yielding up a larger proportion than the latter; this is accounted for by the urinary secretion and exhalation from the lungs and skin persisting throughout the winter sleep. The brain and spleen, however, retain their normal amount of water; just as they do in death from privation of liquids. The mineral constituents of the blood and muscular tissue are

much reduced; while they undergo a positive increase in the liver, spleen, and brain. An abundant formation of glycogen takes place in the first of these organs.

Influence of Diet on the Composition of the Bones.—A fresh set of observations on this interesting subject is contributed by Weiske (*Zeitschrift für Biologie*, Bd. x. Heft. 4). He has already shown that by depriving even growing animals of their due supply of lime and phosphoric acid, no change is wrought in the chemical composition of their bones. He now brings forward evidence to show that if lime be withdrawn as completely as possible from the food, no further increase of bone-tissue takes place; that, on the contrary, the skeleton wastes just as in death from general inanition. An increase or diminution of any one of the mineral constituents of bone in the diet of an animal does not seem to produce any corresponding variation in the composition of its osseous tissue. Lastly, it is impossible to substitute some unusual element (magnesium, strontium) for lime in the bones, by introducing it in the food, either with or without a proportionate abstraction of the ordinary mineral constituents from the animal's diet. (This is in striking opposition to the results arrived at by Papillon.)

Action of certain Biliary Derivatives on the Animal Economy.—Feltz and Ritter had previously ascertained (*Comptes Rendus*, July 13, 1874) that the introduction of large doses of the taurocholate or glycocholate of soda into the circulation, caused speedy death with epileptiform convulsions. They now (*ibid.*, December 14, 1874) investigate the action of the sodic salts of cholic and choloidic acid, that of dyslysin, glycocholl and taurin, in a similar manner. These substances are found to be devoid of active properties. Accordingly, they conclude that the toxic action of the salts of the bile-acids cannot be explained by their undergoing dissociation in the body. The injection of the pigmentary principles of the bile produced no very marked effect; cholesterin gave rise to accidents of an embolic order only.

ASTRONOMY.

Shadows of Jupiter's Satellites.—During the last four years Mr. Burton has frequently observed that the shadows of Jupiter's satellites projected on the disc of the planet during transit were elliptical, and that this was, as a rule, the case only when Jupiter was near quadrature, and the shadow therefore seen obliquely. Mr. Burton's explanation of the phenomenon is that the shadow falls on cumulus clouds, which give rise to the markings on Jupiter's disc, these clouds being dark and therefore invisible wherever the shadow falls, but in full sunshine scattering the light in all directions. The shadow will thus present exactly the same appearance as a cylindrical hole which sends no light to the eye, but allows light from the bright clouds forming its boundary to pass; and such a hole, when viewed obliquely, will appear the more elliptical the greater its depth. From his estimations of the ellipticity on different occasions, Mr. Burton has deduced a depth of atmosphere of from 3,000 to 9,000 miles, a result which would accord well with the small density of Jupiter as a whole, only a quarter that of the earth. On the hypothesis that the bright clouds are scattered at different levels in an atmosphere of considerable thickness, the observed decrease of brightness near the limb is explained by supposing the sunlight to pass freely into space through interstices between the clouds near the limb, so that none of it is received back again by the eye. Mr. Burton's paper is given in the *Monthly Notices* for December.

Accuracy of the Tables of Venus.—Mr. Hind has compared the observations of the Transit of Venus made in Egypt with the predicted times deduced from Le Verrier's tables, and has found an apparent error of only a few seconds of time,

hardly exceeding the discordance between the several observations. Considering that a single second of arc corresponds to the motion of Venus in twenty-five seconds of time, this result is extremely gratifying, and tends to increase our confidence in the value for the sun's distance which M. Le Verrier has deduced indirectly from his Tables of Venus. The error of the tables formerly in use was no less than fifteen minutes for the time of egress at Alexandria.

Spectrum of Coggia's Comet.—Dr Vogel, in the *Astronomische Nachrichten*, No. 2018, discusses his own and other spectroscopic observations of Coggia's comet, his object being to determine the positions of the brightest parts as well as of the edges of the three bands seen. The zero used for his scale was the middle point between two of the magnesium lines (b_2 and b_1), and every precaution was taken to avoid any disturbance of the spectroscopic; but the method seems hardly so satisfactory as that of direct comparison with the carbon spectrum seen at the same time, and side by side with that of the comet. While admitting that the three bands in the spectra of different comets have their edges on the red in the same positions in the spectrum, Dr. Vogel considers that the place of maximum brightness in each band varies, which may, in his opinion, arise from the different conditions of pressure and temperature of the gas (whether a compound of carbon or not) of which comets appear to be composed. At the same time Dr. Vogel remarks that the positions of the brightest points of the bands of dioxide of carbon, with which the comet was directly compared at Greenwich, do not agree with those of the hydrocarbons, which latter he considers more closely to resemble the spectra of comets, a conclusion which differs entirely from that of English spectroscopists who have made the carbon spectrum their special study. At the same time it is quite possible that Dr. Vogel was using dioxide of carbon under different conditions, and in any case a direct comparison of two spectra must have more value than any scale readings, however carefully made.

The Velocity of Light.—A new determination of the velocity of light has been made by M. Cornu, under the auspices of the French Academy of Sciences, on the plan devised by M. Fizeau, the time taken by light to travel twice over the distance between the Paris Observatory and the tower of Montlhéry, twenty-three kilometres distant, being determined. The light of a Drummond lime-light, after passing through a telescope nearly nine metres long, was thrown in the direction of Montlhéry, and reflected back from that place by a collimator (or telescope without an eye-piece) pointed in the direction of the light, and having a plane reflector at its focus, the returning beam being viewed by the same telescope through which it first passed. At the focus of this telescope a toothed wheel can be made to rotate very rapidly (1,600 times a second), and between the teeth of this wheel the light passes out, but on its return the wheel has turned a little, and the observation consists in noting at what rate the wheel is turning when the returning light is cut off by the interposition of a tooth in place of the space between two teeth. When this is the case the wheel must have turned through half a tooth, one and a half teeth, two and a half, or some similar number, in the interval taken by light to go and return, so that from the number of teeth and the rate of rotation this interval is determined. M. Cornu finds a velocity of 300,400 kilometres a second, a result which is probably true to one-thousandth part. The distance of the sun indirectly follows in two ways from this result: (1) from eclipses of Jupiter's satellites which happen earlier when the earth is nearest to Jupiter than when she is farthest off, light having in the latter case to traverse the additional space of the earth's orbit, which is found by observations of these eclipses to make a difference of nearly sixteen minutes, so that with the velocity of light just found, the sun's parallax comes out $8''.88$; (2)

the motion of the earth in her orbit causes an apparent displacement in the positions of stars, known as aberration, which is equal to the earth's velocity divided by the velocity of light; the earth's velocity in her orbit being found in this way from the observed displacement and the velocity of light, the size of the orbit described and the distance follow at once from the length of the year; the sun's parallax is thus found to be $8''.88$ or $8''.80$ according as Bradley's or Struve's value of aberration is taken. From a comparison of observations of Venus with theory, Le Verrier deduced a value $8''.86$, and the observations of the parallax of Mars in 1862 gave $8''.84$.

Melbourne Observatory.—M. Ellery's reports for 1873 and 1874 on the work done at the Melbourne Observatory have been published. A large number of meridian observations have been made, though the zone work has not been resumed, and some excellent photographs of the Moon have been taken with the great Melbourne reflector of 76 feet aperture. The work for which this instrument was specially ordered has not progressed very rapidly, only two nebulae having been examined on twenty-seven nights in the course of thirteen months, and the Board of Visitors specially recommend that no consideration whatever be allowed to interfere with the important work of scrutinising the nebulae. At present visitors are admitted to the Observatory in the evening, and this causes great interruption, so that the adoption of the rule, rigorously carried out in this country wherever real work is done, of excluding all visitors while observations are being made, seems imperative. Mr. Ellery has made extensive preparations for the Transit of Venus, three stations having been equipped, and his observations of accelerated egress for comparison with the Egyptian results will be of great value in consequence of the failure of all the New Zealand parties to observe this phase. Photographs have also been taken, and double-image measures of cusps made.

Orbit of ζ Cancri.—The remarkable triple star ζ Cancri has been observed assiduously since 1831 by W. Struve and his son Otto Struve, who has now reduced all the observations and determined the orbits of the three stars. The system is composed of a close pair of stars about $1''$ apart, with a third star $5''.5$ off, and the apparent path of one of the close pair about the other is an eccentric circle (the perspective view of the ellipse which is really described), with a period of sixty-two years. This is on the supposition that the attraction of the third star may be neglected on the average of all the observations, the problem of determining the motion of three mutually attracting bodies being beyond the reach of our present analysis. The path of the third star seems very remarkable, consisting of a series of loops, each described in about twenty years, and M. O. Struve finds that its motion may be satisfactorily represented by supposing the third star to describe a small circle of $0''.3$ radius in twenty years, the centre of this circle being carried uniformly round the other two stars, so that the path of the third star would be an epicycle, which might result from the attraction of a dark body in its immediate neighbourhood.

Planetary Tables.—In presenting to the French Academy his theory of Neptune, M. Le Verrier gives a general review of the work he has carried out without intermission for the last thirty-five years, forming a complete theory of the eight principal planets, with tables of their motions far exceeding in accuracy anything yet produced. The comparison of theory with observation led M. Le Verrier to conclude that there must be some unknown mass attracting Mercury, and probably placed between that planet and the Sun; but the existence of any such planet has not been established by observation, though it is quite conceivable that the attracting mass may consist of a large number of asteroids too minute to be individually perceived. In the case of Mars, a

ilar discrepancy between theory and observation led to a result of the same kind, but the attracting mass required was found by increasing the Earth's mass by an eighth part, which involved a decrease in the received value of the sun's distance of one twenty-fifth part, and the same conclusion followed from the discussion of the motions of Venus and the Earth, agreeing remarkably with the value of the Sun's parallax deduced from the velocity of light, from the measures of Mars made in 1862, and from the re-discussion of the transit of Venus in 1760.

Der Naturforscher quotes, from a paper of Herr Ascherson in the *Botanische Zeitung*, some remarks on the plants of the Libyan Desert observed by Rohlfs's expedition. The greater part show their struggle with local conditions through their half-globular form, and either a minimum or a suppression of leaf surface. The leaves are often reduced to fleshy scales, or overgrown with a protection of thick hair. An armature of thorns and prickles is very common; even in the usually stemless family of grasses the collector is likely to be wounded by the sharp points of *Aristida pungens* and *Vilfa spicata*. Most of the desert plants are destitute of the pleasant hue of green; only *Schouwia Schimperii* and *Scopolia nutica* decorate themselves with beautiful broad leaves of that colour. These plants also differ from the majority in their bright purple and dark violet flowers. An inconspicuous inflorescence adapted to wind-blown dust is most common. The seeds are mostly small, numerous, and frequently furnished with feathers or wings, which give them a chance of reaching a spot where they can develop. Nearly all possess the property of working up through the sand as it threatens to overwhelm them. The marisk especially exhibits this property, and often reaches a height of from 3 to 5 metres in the sand-hills. The group of stemless palms are exceptions to this rule. Their thick leaves keep the sand back, and they are frequently found at the bottom of sand-hollows. The greater part of the wild plants growing in the oases appear dependent upon the cultivation of those spots, and would perish if it were abandoned. Most of them are wanderers from the Mediterranean.

PLANTS of the Mallow family have long been known to yield useful fibres as well as mucilage, and we learn from *Comptes Rendus* that MM. Bouju frères have devised a mechanical process for treating the stems of Gombo (*Abelmoschus*, or *Libiscus*, *esculentus*) so as to afford a pulp which can be converted into good paper—equal, so it is said by M. Landrin, to the best made from rags. The plant grows abundantly in Syria and Egypt, and is cultivated for its edible fruits. The MM. Bouju previously patented methods of using the fibre for cordage and woven fabrics. Gombo paste, sometimes used in medicine, is made from aummy and mucilaginous substance, extracted from the plant by water, which the French have named *gomboine*. An analysis of gombo gives:—

Water	13.82
Gombine	19.50
Cellulose	60.75
Resin	0.93
Mineral matters	4.75
Substances not reckoned25
	100.0

THE action of electro-magnets on the spectra of certain gases forms the subject of a communication to the French Academy by M. J. Chautard. A Geissler tube with a straight constricted portion is placed between the poles of a magnet, at a short distance from the slit of a spectroscope, and a micrometer is arranged, so adjusted to the Fraunhofer lines as to allow the wave lengths of the different colours to be read off with facility. A second spectrum of the gas employed, in a tube not affected by the magnet, is also brought into the field for comparison. Hydrogen, chlorine,

bromine, iodine, oxygen, sulphur, selenium, and nitrogen have been experimented with, and the electric discharge through them made either with a coil, or a Holtz machine. The light emitted by sulphur and selenium was much diminished by the action of the magnet, and sometimes extinguished in the course of a few minutes. Chlorine and bromine were affected in the opposite way; their lustre was augmented, and numerous fine lines burst out, especially in the green. M. Chautard remarks that these facts may have some importance in cosmic spectroscopy, and in the obscure relations that exist between light and magnetism.

THE forms assumed by micro-fungi are so various, and many points in the history of their development so obscure, that no one acquainted with them would be surprised at fresh discoveries proving that almost any number of so-called species are only varieties, differentiated by special conditions of growth. M. Duval claims to have proved that special ferments, lactic, benzoic, and uric, can be obtained from the alcoholic ferment, yeast, sown in appropriate substances. He maintains the doctrine of the mutability of microscopic germs, and, while admitting that M. Pasteur is right in affirming that no organism arises except from a pre-existent germ, he supports his former master, F. A. Pouchet, in declaring that the atmospheric germs are not actual ferments, but capable of becoming such, or of assuming other forms, according to the nature of the medium in which they develop. He refers to a paper in the *Journal de l'Anatomie et Physiologie* for detailed information. He regards "the functional mobility of the living cell to be in biology analogous to isomerism in chemistry. The study of mutability applied to the genesis of animal ferments," he expects, "will throw a clear light upon zymotic diseases, and he anticipates that it will soon overthrow the notion of specific miasma." (*Comptes Rendus*, November 16, 1874.)

WITH reference to the November meteors, M. Chapelas, in a note to the French Academy, observes that, notwithstanding the state of the atmosphere on the nights of the 12th, 13th, 14th, was unfavourable, it may still be concluded from the observations found practicable, that there was no special shower this year. He states that it has often been noticed that the November display, unlike that of August, is never preceded by a meteoric recrudescence, but comes abruptly. The negative result of 1874 need not occasion surprise, as M. Coulvier-Gravier has shown that for some years after the great exhibition of 1833 none appeared, and all observers noticed that there was a remarkable increase of meteors on the November nights in years closely preceding 1868, when the quantity was truly remarkable.

"If," says M. Chapelas, "we attribute the origin of the November shooting stars to the dispersion of the matter constituting Tempel's comet, and forming a meteoric current, which, according to the theory, ought to correspond pretty closely with the comet's orbit, we may conclude from the preceding observations that this current is far from filling the entire orbit; that the densest part of it occupies a very limited space; that a less dense portion follows, and that the rest of the ellipse is either empty or contains only an insignificant quantity of meteors." He adds that it will be interesting to see whether the meteoric current of November 27 exhibits the same peculiarities, and in the same way contrasts with the August Perseides, which appear every year, though with variable intensity.

THE *Numismatic Chronicle*, vol. xiv. part iii., contains four papers. The first, by Mr. Gardner, of the British Museum, is devoted to the description of a very remarkable coin of Heraeus, king of the Sakas or Scythians, a ruler unknown in history, but proved by this coin, or rather by the inferences drawn by Mr. Gardner from it, to have held sway in Bactria at the end of the second or the beginning of the first century B.C. The Greek

inscription on the coin (*Ῥαυαννοῦντος Ἡραίου Σάκα Κοιράνου*) is remarkable, not only for the strangeness of the words employed—*Ῥαυαννοῦντος* instead of *βασιλεῦντος*, and *κοιράνου*, which the Saka king seemed to imagine represented Khan—but also for the orthography, *ρ* being represented by an upright stroke closely resembling the *ι* on the same coin (unless indeed that *ι* be also a *ρ*). The types are—obverse, bust of king; reverse, king on horseback crowned by Nike. It is a highly interesting fact that the Chinese writers assert that the kings of Ki-pin (by which they meant some tract of country not far from Cabool, at that time ruled by Saka kings) struck money bearing on one side the effigy of a man, on the other a horseman. Of this Saka coinage of Ki-pin, Mr. Gardner believes this to be the first certain example. The next article, also by Mr. Gardner, is on "Thasian Manubria," giving a list of the stamps on the handles of Thasian amphorae preserved in the British Museum, and discussing the use of these stamps. M. Ferdinand Bompis, an authority on the subject of Macedonian coins, is the author of the third paper, on a coin of Ichnae; while the fourth is a continuation of Mr. Cochran Patrick's series of papers on "The Annals of the Scottish Coinage," this number bringing the annals down to the year 1600. The part concludes with notices of the foreign numismatic journals, and a review of Mr. Grueber's *Catalogue of Roman Medallions*.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY (*Monday, January 4*).

SIR SIDNEY SMITH SAUNDERS, C.M.G., President, in the Chair.—Mr. Stevens exhibited varieties of *Diloba caeruleocephala* and *Hibernia defoliaria*, bred from larvae taken near Brighton. Mr. Smith exhibited a box of hymenopterous insects, collected in the neighbourhood of Calcutta by Mr. Rothney. It comprised several rare species of Formicidae and Fossomes, and also many undescribed species of Apidae, among which were two species of *Nomia*, one of them with remarkable capitate antennae.

Mr. McLachlan made some remarks on the December Moth (*Cheimatolia brumata*), which he had observed one evening during the recent severe frost, attracted in great numbers to the gas lamps in the neighbourhood of Lewisham. Mr. Weir remarked on the importance of ascertaining whether they were hibernated specimens, or whether they had been newly hatched during the severe weather.

A letter was read from Mr. R. S. Morrison, of George Town, Colorado, expressing a wish to be placed in communication with any entomologists who might be interested in the insect faunas of the higher altitudes (8,000 to 14,000 feet), which he considered should be more fully investigated.

The Secretary exhibited a small bottle containing specimens of a Mantis, forwarded to him from Sarawak by Mr. C. C. de Crespigny. He stated that while sitting at table he was attracted by the unusual appearance of a column of ants crossing it, but on looking more narrowly he observed that they were not ants, but a species of Mantis, and he believed them to be full-grown insects, but that they had no wings. Mr. McLachlan, however, observed that some of the specimens had rudimentary wings, and the President and others believed that they would prove to be larvae, and not perfect insects.

Part IV. of the Transactions for 1874 was on the table.

SOCIETY OF BIBLICAL ARCHAEOLOGY (*Tuesday, January 5*).

S. BIRCH, LL.D, President, in the Chair.—The following papers were read:—

a. *Ethiopian Annals*.—Translated by G. Maspero.—*Stèle of King Horsiaten*.—This stèle, the text of which has been published in Mariette's *Monumens divers*, relates the war of King Horsiaten

ten against the people of the Nabasi Land, and the district of Maddi (the Mataia of the Greeks). It then describes the grand ceremonies which took place at the Temple of Amen of Napata, after the Ethiopian king had obtained success, which he as usual attributes to the direct favour of the deity. Some further adorations to Osiris, and a long list of votive offerings conclude the inscription, which, as well as that which followed, was accompanied with critical and geographical notes.

b. *Stèle of King Nastosenen*.—This interesting stèle, which has been partly translated by Brugach-Boy in his *Géographie*, relates the wars made by King Nastosenen against the various petty monarchs of Southern Egypt, including Dongola and the district around Wady Halfa, and many other districts yet unidentified. After recording these victories the stèle relates the adorations paid by the king to his tutelary deity Amen of Napata, and the amount of treasure and offerings presented to the temple of that divinity.

c. *On some Cypriote Antiquities discovered by General di Cesnola*. Described by S. Birch, LL.D. —In opening up the foundations of a ruined temple at Salamis, a variety of votive statues and terra-cotta figures were discovered, executed in various styles of art, and with a greater or less degree of care. The principal object was a small limestone pediment, the tympanum of which was filled up with two draped female figures, represented as upholding the architrave, while at either of the angles was figured a crouching lion, having the tongue protruded over the lower lip, as is common in archaic Greek art. The whole were in very low relief, and were represented as facing the spectator. On the plinth below was a long Cypriote inscription, filled in with red paint.

ROYAL ASTRONOMICAL SOCIETY (Friday, Jan. 8).

A LETTER was read from the private secretary of the King of Siam offering on the part of his Majesty to entertain as his private guests any English astronomers who might go out to observe the total eclipse of the Sun on April 5. The Astronomer Royal communicated a letter from Lord Lindsay giving an account of his observations of the Transit of Venus at Mauritius. Though the phenomenon of most importance, ingress, was lost through cloud and the low altitude of the Sun, a large number of valuable measures were taken with the double-image micrometer and with the heliometer, and out of nearly 300 photographs, 100 were selected for future measurement. Mr. Meldrum at the Mauritius observatory appears to have secured a satisfactory observation of ingress. No news has yet been received from Rodrigues, but as the Sun is somewhat higher there at ingress, there is a better prospect of complete success. A letter was also read from Admiral Ommaney, who observed the transit at Thebes. Mr. De La Rue called attention to the discrepancy of four seconds between the results of two observers at Cairo, which he seemed inclined to attribute to a difference in the optical performance of their telescopes, and he urged that not only should the personal equations of the various observers be determined, as had been done by the help of the model both at Greenwich and at the several stations, but that the effect of different telescopes on the observation should be found on the return of the expeditions, those used by different nations being carefully compared in extension of the plan already carried out at Greenwich. A paper from the Astronomer Royal was read, giving the results of the measures of cusps made at the Royal Observatory, Greenwich, during the solar eclipse of last October, from which it appeared that the error of Hansen's Lunar Tables at that epoch was about 6"; this comparison with the tables at the time of new moon can only be made when an eclipse occurs, and observations within several days of new moon are rare.

LONDON ANTHROPOLOGICAL SOCIETY.

(Annual Meeting, January 8).

DR. CHARNOCK, F.S.A., President, in the Chair. After reading Report of Council, the President delivered the annual address.

ASSOCIATION FOR THE IMPROVEMENT OF GEOMETRICAL TEACHING (Tuesday, January 12).

THE fifth annual meeting was held on Tuesday, January 12, at University College, Dr. Hirst, F.R.S., President, in the Chair. The report of the committee showed satisfactory progress during the past year. At the beginning of 1874 the treatment of Proportion (*Euclid*, books v. vi.) had for some time occupied the Association, and there were then under consideration several methods, comprising (1) modifications of Euclid's system, in which multiples of the magnitudes to be compared are taken, as when we compare French and English measure by saying that 8 kilomètres are equal to 5 miles; (2) the method of *aliquot parts*, in which common measures of the magnitudes are used, as when we divide both into mètres, and say that a mile is 1,600 mètres, and a kilomètre 1,000 mètres; (3) a geometrical method for straight lines only. A further question had arisen, whether it was desirable, while insisting on a rigorous treatment of the subject, to supplement it by a simpler scheme applicable to commensurable quantities only. Several criticisms had been laid before the Association, including two valuable papers by Mr. Alexander Ellis, F.R.S., in which he dwells especially on the necessity of giving students a clear conception of *continuous magnitude*, as distinguished from magnitude numerically measured. During the year the sub-committee (Messrs. Hirst, Merrifield, Hayward, Wilson, and Moulton), have drawn up a syllabus of propositions on Proportion and its geometrical applications, containing a rigorous treatment of the theory of Proportion, based on Euclid, and a short conspectus of the chief definitions and results, intended as a preface to its geometrical applications, and designed rather for illustration than for rigorous proof. Dr. Hirst, in introducing the discussion, alluded to the advance of public opinion in England on the subject of geometrical teaching, which, it was now generally admitted, needed to be made more plastic, and hoped that the publication of the work of the Association, accompanied by a tabular comparison of the order it had adopted with that of Euclid, would facilitate the recognition by examining bodies of some liberty of choice in the study of geometry. He also referred to the progress of a similar movement in Italy, where the subject was much discussed in educational journals, and where, though Euclid had been temporarily rehabilitated in order to get rid of inferior text-books, it was intended ultimately to adopt some other system. Mr. Hayward, after calling attention to the way in which the late Professor De Morgan's ideas are gradually influencing the mathematical teaching of the country, explained the principles on which the sub-committee had drawn up their syllabus. In justification of the popular treatment of Proportion prefixed to its geometrical applications, he pointed out that while Euclid insisted on a perfect definition, modern teachers, while aiming eventually at the same precision and comprehensiveness, preferred to begin with less general and therefore easier conceptions. Mr. Ellis expressed a general approval of the work of the sub-committee, and suggested a few modifications in matters of detail. It was resolved to publish the syllabus of the Association, which is now complete as far as regards the subjects treated in the first six books of Euclid, and to submit it to the committee of the British Association.

ROYAL SOCIETY (Thursday, January 14).

THE following papers were read:—By Mr. J. W. L. Glaisher, "On a Class of Identical Relations

in the Theory of Elliptic Functions;" by Mr. W. J. Johnson, "On some remarkable Changes produced on Iron and Steel by the action of Hydrogen and Acids."

FINE ART.

SIXTH WINTER EXHIBITION OF OLD MASTERS AT THE ROYAL ACADEMY.

(Second Notice.)

To find fault with names and descriptions in a collection of this kind is an easy task. Half an hour's walk through the gallery may furnish any one with a stock of observations of that kind. But to find fault with names and descriptions, and especially to find fault with them at random, is not criticism. I have to return to the charge, and to plead, in face of what has been written in more quarters than one, that it is deplorable when misnomers and misprints, real and imaginary, are harped upon ungraciously and with insufficient knowledge. It is deplorable to throw discredit and discouragement on that work by which the Royal Academy deserves best of us. The important thing is that the private treasures of the country should be brought out for enjoyment, for comparison and study, and should thus become, so far as opportunity extends, the property of us all. The Royal Academy in its winter exhibitions creates the most precious of opportunities for this end. To be ungracious and incautious in fault-finding is the worst way of using the present and the best way of spoiling future opportunities. What society would continue to invite, or what owners to contribute, if that was to be their reward? As it is, the task of invitation and collection is not so easy; the sense of obligation to the community in private owners, as I said last week, is not so universal; the difficulty is to prevail upon private owners and conciliate them. In addition to the difficult task of inviting and collecting, the Royal Academy, it is often urged, should provide the visitor to their winter exhibitions with a catalogue he could safely trust and learn from. No doubt that would help the public and make the undertaking perfect; but I wonder what idea of the labour of commentary and criticism is entertained by those who are so ready to thrust it upon others? An accurate critical catalogue of such a gathering of old masters would take a body of experts to compile, and they would need to be a longer time about it than the pictures are absent from their masters' homes. The only time for the research, the commentary and comparison, by which the foundations of such a catalogue must be laid, is while the pictures are actually under exhibition; and the visitor requires some kind of catalogue from the opening day. The Royal Academy, as it seems to me, follow the one practical plan in giving each picture, not their own warrant, but the name its owner gives it. But at least, it will be said, they are bound to correct obvious errors. I think they are bound to keep out obvious forgeries, imitations, or copies; but, with regard to what they take in, were they once to begin correcting, where and on what principle should they stop? Questions of attribution and identification are only now and then at all obvious; in nine cases out of ten they are extremely delicate; and where shall the line be drawn? It seems to me that herein the public should look for enlightenment, not to the members of the Royal Academy, whose business it is to be painters, but to those who make the history and criticism of painting their business, and who have leisure and ought to have patience to do the business well. Their task must needs include plenty of negative points, corrections of attribution and the rest; but why should not these be made with exactness and deference, instead of at random? and why should criticism be more eager about these than about the positive points, the value and meaning, the beauty and delight, which are there to be made far more abundantly?

To-day, according to our programme, we deal with subjects of religion. The chief example of Florentine religious art in the exhibition, at least the largest and most intact (No. 181), raises points of the negative kind which reflect upon others besides the compilers of the present catalogue. It is a square altarpiece in tempera by Cosimo Rosselli, excellently preserved. Of the great painters who worked for Sixtus IV. on the walls of his chapel in the Vatican, between 1480 and 1486, Cosimo Rosselli was the weakest, the least forward in the perfections of his time. Vasari has a tale, which most likely is no more than a tale, that he won the prize over his betters in this enterprise because, trusting to the Pope's little skill in painting, he had made a great show in his compositions with gilding and fine colours. To be profuse with gilding and fine colours is not in truth a weakness of Cosimo Rosselli; but it is his weakness to be a little fantastical and at the same time a little dull. He is far below either of his Florentine fellow-workmen in the Sixtine chapel—below Botticelli in individuality and sentiment, below Ghirlandaio in universality and grasp. This mystical picture represents him at his best. The subject is an unusual one in the free art of Italy after the Middle Age. It shows the vision of a symbolical crucifix, or holy cross, adored by a choir of seraphs and angels in the sky and a group of saints on earth. Christ is extended on the cross, impassive, in royal robes and crown, according to a devotional fashion of early art. One foot of Christ touches the sacramental chalice placed on the ground beneath the crucifix: his straight black robe has a rich jewelled border and a fringe of gold, green, and red. Three crosses are embroidered above his girdle, and one on each of the white shoes upon his feet. Behind the crucifix there are the usual flying heads of cherub and seraph, with four angels ringing them about, and two more angels above, scattering roses from right and left. The head of Christ is empty enough in character; but in these cherubs and angels there is much sweetness and invention; the colour in its quiet tones is very pleasant, and the glimpse of landscape—lake and promontory with a low horizon—has a very fine character. But the saints are the best part. On the left stands Dominic in his character of Predicant, pointing to the open book with text on one page and an illumination on the other. Below him kneels John the Baptist in the usual coat of camel's hair. On the right stands another Dominican in the plain habit of the order, only with small black crosses embroidered on a white band about his shoulders. This is Antonino, the beloved Archbishop; one of the most amiable figures of Italian history in the fifteenth century. He was appointed to the see of Florence by Eugenius IV., upon the recommendation, as is said, of Fra Angelico, his friend and cloister-brother of St. Mark's, who had himself been offered the dignity and declined it. This picture was of course painted after his death, which happened in 1459; but Cosimo, born in 1439, must have known his features familiarly; and the type stands well for that of the good ascetic who, "without horses and without vestments and without attendants and without ornaments of any kind in his house," as Vespasiano says, exercised for years the purest and healthiest moral influence both upon public and private affairs in the peninsula. Below him kneels St. Mark the Evangelist, with the gospel in his left hand and the pen in his right, and his symbol the lion (whose head only we can see) beside him. Now Vasari, in his life of Cosimo Rosselli (vol. v. p. 30), tells how "in St. Mark's, at Florence, upon a panel in the chapel of the cloth-weavers, he wrought the holy cross in the midst, and at the sides St. Mark, St. John the Evangelist, St. Antonino Archbishop of Florence, and other figures." Mr. Fuller Maitland, it is evident, sets before us here the very picture mentioned by Vasari. Ros-

selli is not likely to have painted such a subject twice; and to have to read for "other figures" Dominic, and for "John the Evangelist" John the Baptist, is the kind of erratum we are used to in Vasari. Vasari has had followers more careless than himself. Dr. Waagen (vol. iii. p. 4) seeing a second saint in the Dominican habit and a saint with a lion beside him, dubbed them hastily St. Peter (sc. Peter Martyr) and St. Jerome; although the Dominican has not the cleaver which is the indispensable sign of Peter Martyr, and although the saint with the lion has no other resemblance to Jerome. And Messrs. Crowe and Cavalcaselle, with less than their customary precision, while they point out that this is "possibly" the original spoken of by Vasari, repeat Waagen's error about Peter Martyr and Jerome. Lastly, the Academy catalogue in its turn writes Jerome for Mark, and, recognising the Archbishop, spells him Antonio instead of Antonino. Let the reader forgive me for dwelling on these details; but errors of detail had hitherto stood in the way of an identification which may be taken as certain. Another altarpiece from the same collection is hung as a pendant to the Cosimo Rosselli. This is a devotional *Ascension of the Virgin*, ascribed by Young Ottley, whose property it was and who engraved it, to Giotto; and now to Fra Angelico. Messrs. Crowe and Cavalcaselle (vol. i. p. 589) pass it as the work of Angelico. The Virgin in pale lilac drapery, and with hands folded, sits within an almond-shaped glory barred with clouds and sustained by angels; the tomb below her is in the foreground of a landscape of white rocks; roses and lilies have burst into blossom within the tomb, and Francis and Bonaventura kneel to right and left in front of it. This cannot, I think, be the work of Angelico. I see neither his science of composition, nor his delicate draughtsmanship, nor his purity and vividness of colour, nor his holy inwardness of sentiment. The Virgin's head, especially her mouth, has been renewed; and so have the gilt parts in general. Otherwise judgment is free; and this low-toned painting with its stiff Virgin, its angels with their short arms in false drawing sustaining the *mandorla*, its weakness here and archaism there, belongs to another school than that of Florence. The peculiar kicking action and pointed draperies of the two lower angels, with the disordered locks and interesting eager face of one of them (the best point in the picture) are of themselves enough, I think, to say, not Florence, but Siena. A writer in the *Saturday Review* has already referred the piece to the Sienese school, and no doubt rightly; although, of the names there brought together from divers times and tendencies in the school, one only has any application. That is Sano di Pietro, "the Angelico of Siena" as he has been called; and by Sano di Pietro, or else Matteo di Giovanni di Bartolo, called Matteo da Siena, I am confident that this picture is. Midway between these pendants, on the same wall, hangs a work full and brimming over with the spirit, the animation and multifariousness, of Florentine life in the fifteenth century. This is the round of the *Adoration* (184), which belonged to the Barker collection, and which, for all it has suffered, one would almost have been glad to see added, as so many prizes from that collection were added, to the National Gallery. When a painting shows the manner of Lippo Lippi, but adds to it certain other qualities—a particular passion for birds and beasts, an extreme delight in multitude and processional pomp and animation—then the natural name to give it is Pesellino. Francesco di Stefano, called Pesellino from his grandfather Peselli, was a close imitator of Lippo Lippi, but added to his manner the predilections I have named, and in his turn handed them on to Benozzo Gozzoli. They assert themselves in every inch of this dramatic panel. Certainly the work is of the nearest possible kindred to those we know of Pesellino in Florence. But between Pesellino and Lippo Lippi in such cases the distinction is

fine, and there is, perhaps, no reason to quarrel with the accepted title which gives this work to the greater master. What invention! what vivacity and variety! The stall in the middle of the view is not only a stall for ox and ass, but a stable full of horses, and farriers busy shoeing them; upon its roof struts a peacock; in front of it a gold pheasant and a silver pheasant fly across. The Holy Family are in the foreground; the shepherds have come in by a rocky way, humble peasants and out at elbows; the foremost of the kings has just knelt to kiss with humility the feet of the baby. And behind the kings, such a retinue!—made up of all the richest embassies that the painter had seen file through the streets of Florence on their way to their lodgings at Santa Maria Novella or in the house of Cosimo; riders on horses, riders on camels, the foremost awe-stricken, with doffed bonnets and hands clasped or extended as they come within sight of the holy family; those in the rear gay and chatting. The van of the procession appears from under an archway on the left; its centre is out of sight behind the great block of classical ruins upon which the stall abuts; its rear reappears further off on the right, and is closed by a press of faces high up against the horizon, showing that there is no end to those who have yet to come. And the population of Bethlehem, which is the population of Florence, has turned out to see: mothers with their babies, beggars, idiots, and a little company of the naked who have hurried up, I suppose, either from bathing or from the hospital. It is all delightfully simple and vivid and honest, and full of quaint life and observation and character. Another Lippo Lippi, this time unquestionable, is the Virgin with four angels, numbered 185. This is a very beautiful and characteristic piece, with its roguish boy angels, and its setting of the Virgin's head in front of a little space of sky and roses over-canopied with meeting gold wings. And it has a capital pendant in the Crivelli (No. 182, and the property of the same owner, Mr. Graham); a Virgin with the bony fingers this painter loved, and with all his force spent in the patterning of her dark gold cloak with its dark red lining, and in the imitative rendering of the fly, the pear, the cracked marble dais lettered with his own signature—things in which also his soul delighted after its half grim, half childish, wholly intense fashion. Luca Signorelli, the learned and fearless master who was for Central Italy in the fifteenth century what Mantegna was for the North, is so rare out of his own country that one is delighted to see this fragment of a *Deposition* (177)—one man stooping with his pincers on a ladder, and a couple of soldiers with their tight jerkins and striped hose in the landscape. The principal figure is a model whose vigorous head, tanned and bald with a few white tufts, occurs over and over again in Signorelli's frescoes painted in 1497 and 1498 at Monte Oliveto in the parts about Siena; this fragment has certainly come from some altar-piece done by him about that period. Coming to the days of crowning perfection: here are the two painters of Florence who, at the hour of art's consummation, were wont to join with the most of freedom and sweetness and facility the least of individual character and invention. I mean Andrea del Sarto and Fra Bartolommeo: here they are in two examples, from the collection of Mr. Cook, good in spite of injury and restoration (172, 176). The panel of St. Sebastian (178), claimed by its inscription as a work of Raphael in his first Perugian time, must be left to the debate of experts. I do not see that there is anything in the somewhat prim carefulness and ascetic precision of this nude to positively contradict the inscription; but it is a very delicate matter to decide on internal evidence between one and another of the young unformed scholars of Perugino in such cases. And about the other Sebastian from the collection of Sir William Miles (167) I have still less to say. Its subject is not doubtful: even the all-accepting Waagen, in his account of Leigh Court, protested

against its being called, as it still is, a portrait of William Tell. But its author is very doubtful. Be he who he may—and he cannot be Holbein—the picture is an admirably thorough and careful piece of design, with a masterly piece of work in the foreshortened left hand especially.

Of the Venetian pictures, few this year are of the sacred order. Lord Yarborough sends a Magdalen of Titian (136), which cannot, I think, be by any weaker hand than the master's own. It is the same as his well-known Magdalen in the Pitti. Among replicas of the subject, says Dr. Waagen, "with few exceptions, it surpasses all others, not only in transparency and warmth of colouring, but in elevation of expression." To find elevation of expression in the upturned face and streaming eyes of this stout Venetian woman, whom Mr. Ruskin once called "the disgusting Magdalen of the Pitti," is not easy; but warmth and transparency, the Titianic splendour, are unmistakable in her hair, her blanket, her book, and the noble landscape on the right. The small *Deposition of Tintoret*, from the same collection (128), is also a very characteristic piece in undyed golden tones; the landscape, with its near foliage and distant temple, the vehement graceful Maries about the corpse, are all flung in with the same headlong certainty that makes the art of Tintoret so stirring to look at, even when, for speed and carelessness, his art is almost manufacture.

And with this last of the great Venetians we leave the schools of Italy for good, so far as religious art is concerned. There are no examples to detain us of Tintoret's contemporaries of Bologna, or of their successors in the seventeenth century; and if there were, there is always something depressing in the study of those accomplished Diadochi of the art, whose accomplishment is so much more patent than their inspiration, and who wrought for the austere and militant Papacy after the Reformation in a spirit so different from that which had inspired their predecessors in the service of the humane and joyous Papacy of the Renaissance. It is in Spain that austere and militant Catholicism, the Catholicism of the Inquisition, finds its really imaginative and original expression in art. Of the great painters who flourished when bigotry and luxury ruled hand in hand at the court of Philip IV., Zurbaran is at once the most imaginative and the most austere. He is a great religious, at any rate a great monastic painter; and these two large single figures of Benedict and Jerome, from the gallery of Lord Heytesbury, represent him well (197, 200). Nothing is more masterly than these strong ascetic heads, than these conventual robes falling in broad folds and strong planes of light and shadow; nothing strikes a more appropriate note than this cleft of penitential landscape behind either saint—dark gorges of the Sierras, where white or lurid clouds roll solemnly overhead, and where from lonely rock to rock echoes no sound but the hermit's litany. Near the same place is hung a Virgin Annunciate of the Spanish school, a kneeling figure in full face, with arms extended, the atmosphere about her a golden cloud. This is very strongly and thoroughly drawn, and the dark crimson cloak of the Virgin an admirable piece of grave work. It comes from the gallery of Sir W. Miles, and is ascribed to Velazquez. As such I see that Sir William Stirling Maxwell allows it in both his catalogues—I mean that in his *Annals of the Artists of Spain*, and his *Velazquez and his Works*. If it is by Velazquez, it is not in the manner of his maturity, and can only be the picture he is recorded to have painted of this subject while a boy in the studio of Pacheco at Seville. On a question of Spanish art I speak without book; but is not this rather the hand of Velazquez' distinguished contemporary Alonso Cano?

To most of us, I dare say, the religious art that grew up in the seventeenth century among the Protestant rebels of the Catholic king in the North

will mean more—as indeed it was a thing more profound and new—than that which filled the churches and monasteries of his orthodox kingdom in the South. Here are two capital examples of that artist who, in the cities of Holland, saw in a new light the aspects of rags and squalor and calamity. The Queen's *Adoration of the Magi* (152) has in perfection all the elements which in Rembrandt made up such a strange unprecedented poetry; his love of gloom and faint bituminous light to bring out the solidity and at the same time the glamour of things; his intense popular sympathy and insight into poverty and suffering; his passion for grotesque Oriental properties and fripperies. The peasant mother, with her heavily-swathed babe upon her lap, sits in the night outside the shed; the star of Bethlehem lets down its light, an oily reddish perpendicular ray, from above; the thatch of the shed stands out in the gleam, and in dark shadow under the eave you can see the figure of Joseph. One king kneels forward with his gift, and two attendants kneel behind him; the two other kings with their attendants stand waiting, almost lost in the darkness is a group under a circular umbrella. Rembrandt, as usual, has taken his models from the Jewry of Amsterdam and dressed them in their own stock-in-trade; and the character, the poetry, the splendour of handling, the sense of the real and the familiar amid the unreal and the strange, of I know not what humour and mystery and solemn pitifulness, need no words for those who have eyes to see. The second Rembrandt (153) comes from the collection of the Duke of Abercorn. It is a large *Deposition*, with figures in life-size, quite different in composition from those versions of the subject which exist in the National Gallery and at St. Petersburg, and, I think, at Berlin. The body of Christ lies across the front of the picture, upon a white shroud, the right arm making a particularly ungainly angle. Rembrandt when he attempted to be academical left his genius behind; and this Christ is an ineffective study of that kind, with a head of some academical beauty but little of Rembrandt's intenser power. Where the painter is himself is in the accessory heads—a silver-bearded Joseph of Arimathea stooping over the corpse; a Magdalen with her hand upon her brow leaning in a faint gold light against the cross; above all, a Mary Mother holding the head of Christ, her own head coiled in pale red and white, a faint light bringing out the colour of her features with a mysterious life and reality.

It scarcely occurs to one to think of the work of Rubens as sacred art. The spirit of worldliness and the delight of the eye and the pride of life, luxury and power and opulence not without vulgarity, make the art of the great Fleming a thing the most unlike in the world to the art of the great Dutchman. There are compositions of Rubens finer in the same violent gorgeous way than this great *Conversion of St. Paul* (110) with its plunging horses and rolling Roman soldiers; but this, together with the Duke of Sutherland's *Holy Family* (107) serves justly enough to represent him in the series.

And lastly, what has the English school to show us in the way of sacred art? Only two life-sized pictures of Sir Joshua Reynolds (229, 242), from his great composition for the window of New College at Oxford: subject, the Angel appearing to the Shepherds. The angel is not here; only a shepherd-boy and his dog in one piece, and two grown-up shepherds in the other. The best thing is the dog: he stands among the fictitious drums and capitals of a fallen temple; but his head has all that vivacity and delicate air, with which the pet spaniel follows his mistress across the sward in so many radiant canvases of the same master. But what shall be said of the rest? Dull ugly colour without the master's charm; one of the shepherds a portrait, not good, of Sir Joshua himself, in a serge tunic, with a staff and bare calves; his companion a theatrical profile, with

extended arms; the execution empty and pretentious. It is plain the English school is here engaged upon what it does not understand. It is plain that this is not a new phase of creative genius in the religious order to put beside the mysticism of Siena, or the multifarious vitality of Florence, or the splendour of Venice, or the austerity of Spain, or the rushlit pathos and democratic Christianity of Holland, or even the commoner and more carnal pomp and energy and glow of Flanders. SIDNEY COLVIN.

THE WATER-COLOUR SOCIETY.

(Second Notice.)

WE return to this exhibition to give some account of the landscapes and other miscellaneous works.

Mr. Albert Goodwin sends various Italian studies, distinguished by delicate exactness in a light and bright key of colour, somewhat flat and mosaic-like in touch; the painter being evidently bent upon distinguishing the local tints, with comparative indifference to the total effect of light and shade. For years past, he has been painting in a very methodical and tentative spirit. The present works mark a further stage in his practice; and we expect to see him pretty soon in full possession of his powers, both as colourist and as chiaroscurist. The *Market-place, Verona*, and the *Assisi*, are very attractive examples; *San Zenon* (not "Sanoni," as in the catalogue), *Verona*, is carried somewhat further, but with hardly so pleasing a result. Two studies of *Sea and Sky* should also be looked at; and the little piece of still-life, *Six Inches of Jersey Granite*. Professor Ruskin exhibits four studies, which, though minute and the contrary of robust in manner, are not properly to be called slight, being replete with knowledge and discrimination. The *Glacier des Bossons, Chamouni, October 1874*, is especially interesting in its variety of tender yet brilliant shades of colour; also the *View Driven on Etna, April 26, 1874*. The *Acanthus changing to Acacia, Thirteenth Century, Capital in Main Street of Assisi*, is one of those pieces of architectural decorative design which no draughtsman reproduces with more refined appreciation than Professor Ruskin. Miss Clara Montalba shows very uncommon talent in this gallery. She has great quickness of perception and readiness of resource; likes a large number of different things; and conveys the spirit of them in her rapid characteristic painter-like way. She tends overmuch, however, to the blotty and grimy in handling; as for instance in the *Sketch on the Thames, Limehouse Creek*—which is none the less true and bold. The *Study of Birch-trees at Nääs, Sweden*, is very prettily and spontaneously touched off: the *Rainy Day, Venice*, renders with observable insight the drenched depth of defined colour which distinguishes the Venetian atmospheric effect under such conditions. Other specimens by this lady, of a different quality, are not at all inferior to these. Mr. Powell's sea-pictures mark a high point of attainment in the expression of pale and hazy effect: the light broods within a yellowish whitish veil, which obstructs and yet diffuses it. This is particularly apparent in the *Loch Fyne Herring Boats, Morning*, and in the smaller subject named *No. 185 G. K.—Syra in the Greek Archipelago*, by Mr. Andrews, is a resolute effort at obtaining absolute brightness, and a fairly successful one. Mr. Edward Goodall exhibits one of the most prominent landscape-compositions here, under the title, *Son of Man, can these bones live? And I answered, O Lord God, thou knowest (Ezekiel). Near the Great Pyramid of Sakkara: Excavations at the Tombs under the direction of Marretti Bey*. When one sees a title of this sort, one knows that the painter has been putting forth his strength, hoping to attain greatness, or to be thought to have attained it; likewise one knows that, if he does not happen really to be a great man, it will not be easy for him to appear such, however high-pitched

his subject-matter. Mr. Goodall gives us pyramids, rubbish-heaps, mummy-cases, skulls, bones, jackals, and carrion-birds; and comes out of the ordeal with a certain amount of credit—as much as could reasonably be expected. Regarding other landscape exhibitors, we need perhaps do no more than call attention to some of the contributions of Messrs. Hale, Dodgson, Read, Cox, White, Branwhite, North, Danby, and Marks. We regret to miss Mr. Boyce, whose pleasant, sensible, simple feeling in subject and general treatment, and natural grace and harmony in colour and method, are not to be exactly compensated for by any of his colleagues, however skilful.

The chief animal-subject is the *Sudden Attack*, by Mr. Brittan Willis, a crayon drawing of a Highland herd amid the wild hill-scenery, with two bulls closing in fight. This is an able work, and, by stretching a point, might even be termed a powerful one. Mr. Basil Bradley's *Sketch of Young Lion and Lionesses born in the Gardens of the Royal Zoological Society in 1872* is an important unexaggerated study, worthy of all commendation: the colour, tawny throughout both in principals and in accessories, is capably managed. Mr. Birket Foster's *Studies of Fish* are clever pieces of still-life—not, however, by any means rivaling what old William Hunt used to give us; and Mrs. Harrison's *Iris* is gracefully done.

W. M. ROSETTI.

NOTES AND NEWS.

THE Museum of South Kensington has made the important acquisition of a variety of art objects from Persia, collected by Mr. Murdoch Smith, superintendent of the telegraphic establishment in that country. He has sent over a large collection of the siliceous glazed earthenware of Persia, among which are bowls decorated with blue and black flowers, the sides with a pierced pattern filled in with transparent glaze, the "grains de riz" of the French writers, imitated by the Chinese, and reproduced at the manufactory of Sévres. There is another specimen, also perforated, of drab glaze. Other objects are:—water bottles of bulbous form decorated with brown metallic lustre, and rose-water sprinklers (Golapash), with richly engraved metal mountings: a number of dishes for rice, from Kashan, with decorations of the brightest blue, one with the typical deer, showing its Chinese derivation, others with green glaze: and rasps for scraping the palms of the hands and sides of the feet in the bath, made in the forms of diminutive ducks and slippers.

The examples of metal work are most elaborate, especially two tall cylindrical pots, probably designed for incense, and some plates of a highly sonorous metal, giving out the clearest, most silvery sounds, are inlaid with pure gold. The other specimens consist of various pieces of marquetry and large wooden spoons, used for sherbet, most delicately carved. This valuable collection has been acquired at a really nominal cost.

OUR readers will have read, in the ACADEMY of the 2nd, the advertisement offering rewards to the amount of 200*l.* for the discovery and conviction of the parties who forged Mr. Linnell's signature to copies of his paintings which have been sold as originals. No clue has yet been obtained. It appears that the parties who have committed the fraud would buy an original picture, obtaining at the same time a receipt, letter, or some document relating to the picture, of which they immediately set to work to produce copies which they sold as originals. Being furnished with the receipt, letter, or other document, amateurs purchased the paintings without a shadow of doubt as to their originality, and the manufacture succeeded to admiration.

A LETTER has been received from Mr. G. F. Watts by the Secretary of the Royal Manchester Institution, in reply to a notification that the Heywood prize had been awarded for his picture

Love and Death, in which Mr. Watts requests the Council to retain the prize in their hands to be awarded in some subsequent year "for the most poetic design, the best picture regarded from the highest point of view."

THE sale of 200 paintings by old masters from the celebrated collection of the Marquis of Salamanca is an event calculated to cause great excitement in the art world of Paris. The Salamanca Gallery is especially remarkable for its fine works of the Spanish school. Several of these have previously found their way to the Hôtel Drouot (as, for instance, Murillo's *Death of Santa Clara*, which was purchased by Lord Dudley, in 1867, for 95,000 francs, and was exhibited a few years ago at the Royal Academy Exhibition of Old Masters); but enough still remain to give considerable importance to the sale. Among the most noteworthy we may mention: an *Immaculate Conception*, not this time by Murillo, but by the bold Ribera, who has represented the Virgin in this picture as a magnificent noble woman, with none of the affectation and prettiness of Murillo; two small portraits of Philip IV. and his wife, probably sketches for the large pictures at Madrid; and two admirable *genre* subjects, the *Interior of the Poenda* and *The King's Fox-catcher*, by Velasquez; a *Penitent*, by Zurbaran; *Santa Rosa of Lima*, and six paintings of biblical subjects, by Murillo; several paintings by Goya; a large and fine work by Cerezo of *The Appearance of the Virgin to St. Francis*; and *The Communion of St. Theresa*, an interesting painting by the little-known Portuguese painter Alonso Sanchez Coello. The paintings of the Italian school of this collection cannot compare in merit with those of the Spanish. Most of them are evidently wrongly attributed, but there is one little panel, said to be by Raphael, that deserves attention. If not by him, it is by one of the pupils who had most affinity with him. Nor are the works of the Flemish and Dutch schools very remarkable. Here also there are many flagrant cases of wrongly bestowed names. Two authentic Rubens, however, two portraits by Vandyck, a *Presentation in the Temple* by Jordaens, and several works by Teniers, Snyders, Gerard Dow, Adrian van Ostade, and other masters of the Dutch school, have a real value.

It is thought that the Louvre, which is very deficient in examples of the Spanish school, will probably acquire some of the best pictures of this collection. Its sale will take place on the 25th and 26th of this month.

THE following statement appears in several of the Italian papers:—

"The Government have lately taken possession of the criminal archives placed by the late Pontifical Government in the convent of St. Jerome. On examining these documents there was found in a quantity of waste paper to be got rid of, an inventory of the property of Michel Angelo at the time of his death. This inventory was made by order of the Roman Government shortly after hearing of his death. It contains much interesting information: for example, it gives a list of the statues blocked out by Michel Angelo and not completed, which were found in his studio. It also enumerates cartoons designed by him for works in contemplation, and mentions the sum of money in his possession when he died."

This, if true, is certainly interesting; but our Italian correspondent writes to us that on enquiry about these papers, he was told that they were in reality of little consequence. It is, in fact, very difficult to find out the exact truth of the various reports in circulation respecting the Buonarroti documents. For example, the most contradictory statements have been made respecting the number of letters written by and to Michel Angelo that are to be published at the approaching centenary. Many papers have stated that there were about 700 autographic letters, others 200, and others a different number. Even Italian authorities on the subject have blundered almost as much as foreigners. According to the most trustworthy information

that we can gain, the number of letters is—350 written by Michel Angelo himself, and as many probably as 1,400 written to and about him.

THE French Academy of Fine Arts has elected M. Abadie member of the section of architecture, in the place of M. Gilbert; M. Lefuel, of the section of architecture, president, and M. Meissonier, of the section of painting, vice-president for 1875.

THE death is announced of M. Guillaume Régamey, the distinguished painter of military scenes, and winner of a medal at the last Salon (see ACADEMY, vol. v. p. 556).

MR. C. HEATH WILSON is engaged in an elaborate examination of the frescoes in the Sistine Chapel, for which purpose he has been supplied by the Vatican authorities with a scaffolding of more than 50 feet in height. On the state of the frescoes he writes as follows:—

"I have seen those on the vault of the Sistine under the most favourable circumstances possible, to learn with a conviction settled and immovable that these are the greatest and the most perfectly executed works of fresco painting in the world. They have been frightfully ill-used. It is not smoke only which has damaged these immortal works, but rude and barbarous hands have been there. I think that the damage might be remedied. The *Last Judgment* has been so repainted in many parts as to be in no respect—I mean in point of general effect and chiar'oscuro—what Michel Angelo made it; but the vault frescoes at any rate have not thus been used, they are for the most part free from barbarous and monstrous retouching; but portions have been scoured, I know not when, by working masons, I suppose, for no other hands could have used them so; but the divine painting, although soiled, is there as he left it, as it came from his hands and mind, in all its majesty, its beauty and its absolutely matchless technical skill, and reverent hands might remove cobwebs and dust, and might stop gaping cracks and clear away smoke—for the frescoes are hard and sound. I wiped away cobwebs with a silk handkerchief, and a dark accumulation of this from the breast of Adam. As these hung down in dirty festoons, veiling beauties. I could easily with a light sweep, not touching the surface, cause these accumulations of, I suppose, some generations of spiders to fall down in dusty dusky filaments.

"I am quite persuaded that the picture of the *Last Judgment* was originally harmonised by Michel Angelo with the ceiling, with all his matchless skill—its dissonance has been caused by the work of later times, and in some places it has been mended by hands not trained in any knowledge of art at all."

THE *Nation* tells us a long story about a little picture, of which Mr. Morris Moore is the owner, and which he believes to be by Raphael. There has been endless confusion as to its attribution; for it was bought for an Andrea Mantegna, and was pronounced by Passavant to be of the school of Francesco Francia—probably the work of Timoteo Viti of Urbino. In Venice, in the collection of the Academy, was found a pencil-drawing of the composition, but this drawing had been ascribed neither to Mantegna, nor to Raphael, nor to Timoteo Viti; but to Benedetto Montagna. Whose the picture is, seems still an undecided question. Mr. Moore says Raphael, and wishes, thinks the *Nation*, to sell it to an American. The picture represents Marsyas seated on the left, playing on his flute, while in full front stands Apollo listening to the music of his rival.

THE election of members of the constituent commission of the National Society of Artists, formed on the proposition of M. de Chennevières, took place in Paris on Sunday last. The following were elected:—Sculpture (eight members), MM. Paul Dubois, Guillaume, Cabot, Soitoux, Falguière, Mathurin-Moreau, Marcelin, Carrier-Bellouse; Architecture (four members), MM. Viollet-le-Duc, Labrousse, Ballu, Boeswillwald; Engraving (five members), MM. Henri-Dupont, Veyrassat, Sirouy, Boëtz, Marcial; Painting (fourteen members), MM. Corot, Fromentin, Gérôme, J. Breton, Daubigny, Lajolais, Bonnat, Vollon, Luminais, Chaplin, Bonvin, Feyen-Perrin, Français, Gaillaumet.

PROFESSOR OVERBECK has been lecturing at the Scientific Institution of Cologne on the character of the plastic *genre* sculpture of the ancient Greeks, and on the productions of the moderns compared with the best remains of Hellenic art.

THE STAGE.

"THE NEW MAGDALEN" AT THE CHARING CROSS THEATRE.

MR. WILKIE COLLINS'S *New Magdalen* has re-appeared on the London stage, after a career of nearly two hundred nights in the country, following, at no great interval, upon a career of equal length in London. Reproduced last Saturday before our town playgoers, at the Charing Cross Theatre, it was received with approval, and the generally colder audience of a second night confirmed on Monday the verdict of the first. The success of *The New Magdalen* is, then, an accomplished fact; and one is only concerned to know the cause of it, and to see how far it is justified.

Great stress has been laid upon the moral pointed by Mr. Collins's drama; but those are little familiar with London audiences who lay any part of the success of the play to the credit of its teaching. Here and again very forcibly, the teaching is insisted on by passages of vigorous dialogue addressed in truth to the audience, but the most that the audience does is to lend itself for a moment to listen to this and to applaud it. In good time, it is forgotten, and the audience does not in reality so much applaud the cause as the cleverness of its advocate—an advocate who, strongly possessed with his theme, has done unconsciously what the wily Guido, in *The Ring and the Book*, did consciously—that is, he has mingled truth and sophistry so that his listeners are baffled. And if in narrative "the mixture of a lie doth ever add pleasure," certainly in advocacy the mixture of a truth is of incalculable value to a bad cause. A little truth will leaven a lump of sophistry; and Mr. Collins's sophistry is leavened with much more than a little truth.

No wonder then, that it is momentarily accepted by an audience moved by the art of his story: no wonder that the people's sympathy with the heroine's misfortune and admiration for the Broad Church clergyman who at some cost to himself endeavours to relieve it in unconventional ways, make them half believe for a moment that the Broad Church clergyman is wisdom itself when, preparing, like Micawber, to quit England, with his bride from the Refuge, he "despises the Old World's narrow prejudices, and its superstitions," or when—earlier in the play—having himself been generous and forgiving to the New Magdalen, he propounds the monstrous proposition that "the best among us to-day may be the worst to-morrow." His personal charity, his excellent truths or truisms about the labourer's right to live, make this last nonsense palatable; but if Julian Gray had thought a little longer, he would have seen that even if best men are moulded out of faults, they are *moulded*, not changed in the twinkling of an eye, and would have remembered—what he must quite well have known—that the whole of life, and not one single act in it, makes good or bad. His utterance was not to the credit of his head; but he is a fine fellow, after all, and will doubtless learn his mistake in that New World to which he goes so hopefully—the good New World, free as of course it is sure to be, from every fault of the old. He will not better his heart, in the good New World, but he will mature his judgment.

The approval of the audience then is with him, just while he speaks, but when the curtain falls the moral of the play is forgotten, if indeed the moral really meant is that the new Magdalen is likely to be better at heart and more forgiving than the unsophisticated girl whose place she has usurped. Be this as it may, it is not the moral—good in its teaching of general charity: bad in its

insinuation of almost universal uncharitableness—that makes the success of the piece, or is its chief source of interest. Mr. Wilkie Collins's judgment on certain social questions may have played him false; but his genius of construction has been true to him. And it is not because the work teaches something of the lesson taught by M. Dumas in *Le Fils de Madame Aubry*, and by a younger dramatist, Mr. Gilbert, in *Charity*, that the work succeeds. *Charity* didn't succeed; yet its lesson was the soundest of the three. *The New Magdalen* succeeds because it shows all the constructive power which bound us with a spell in the *Woman in White*. Briefly, *The New Magdalen*, considered as an acting piece, is the strongest thing the stage has seen during many years.

There is not an unnecessary character, there is not an unnecessary scene in it. Hardly is there a superfluous word. The exposition of the story and its development are as lucid and succinct as ever was the summing up of any judge in court of justice. The curtain rises on an incident of the war—the Germans occupy a position from which the French retire. Grace Roseberry, the Canadian girl nursed by a woman who was an outcast, is seemingly dead; the outcast will take her place in the new society which will never have a chance of discovering the imposture. The new Grace Roseberry passes through the German lines, in charge of an English journalist, and at that moment a German surgeon, by an operation unknown to the French, is restoring the real Grace Roseberry to life and consciousness. The first act of the play itself sees Mercy Merrick comfortably settled in the other's place: a rich young man is making love to her, and she has won the regard of Lady Janet Roy. This is success in life. And the first act ends with the arrival of the real Grace Roseberry and her recognition of Mercy Merrick as the woman from the Refuge who had nursed her in the German war. The second act is stronger still. At its beginning Mercy Merrick is still safely in Grace Roseberry's place. No one doubts her story—the story of the other is that of a madwoman. The clergyman, Julian Gray, involves himself in the affair, and while secretly loving Lady Janet's protégée, his duty prompts him alone to see that absolute justice is done to the new comer. At length Mercy Merrick confesses to him her deception, and he waits to hear her confess it to the rest. This she is almost in act to do, when the superfluous taunts of the real Grace Roseberry change for a moment her purpose, and there is a remarkable moment for the audience—a great one for the actress—when Mercy Merrick, stung by these taunts, defies her, and in token of a new persistence calls her aloud, not Grace Roseberry, but Mercy Merrick. This is a scene weak to narrate, but powerfully conceived and powerfully executed. At last contrition does its work on the one woman, or, to speak more truly, the sympathy which is lacking to the other. She cannot see Grace Roseberry carried away to a madhouse. So she makes a clean breast of it, and in the next act, after having proved the heartlessness of every body else, goes away with Julian Gray to that new country which is the Paradise of people who can't get on in this. Were one disposed to go a little deeper into Mr. Collins's work, it wouldn't be a difficult task to show that Mercy Merrick, with her hardness and her contrition, is inconsistent beyond the limits of human inconsistency; and certainly one might decline to give her all the author's credit for virtue when she makes the confession which in common honesty Julian Gray would have made—however unwillingly—had she herself withheld it. But we are not occupied with these things. We have been occupied with showing why the piece has succeeded. Too much, it seems to us, has been made of a dubious moral: too little of a construction of undeniable power.

As a whole, the acting is adequate; and good acting is demanded. Those who know Miss Ada

Cavendish's method of play will hardly need to be told that she is best of all in the finesse of comedy, good in the strongest situations of melodrama, and much less satisfactory in passages which an actress of pure pathos might have made veritably pathetic. Of course she has studied the character carefully—small praise to an actress who means to be an artist, for doing only that—and the result of her study is the composition of a stage figure which is generally interesting, nearly always effective, and rarely touching. Now and again the stage effectiveness, so tempting, even so fitting to the character, is laid aside, and then Miss Cavendish is not only accomplished, but strong—strong at the angered moment where she defies Grace Roseberry: strong in the scene with Horace, in her expression of feverish anxiety, nervous fear, nervous laughter. As Lady Janet Roy, Miss R. G. le Thière makes a picturesque figure, and plays with thorough comprehension of a character not easy to make attractive, for undoubtedly Lady Janet Roy is more imperious than loveable. Miss K. Rivers is Grace Roseberry. It is not her fault if Grace is hard and forbidding. The actress has realised the novelist's conception, and deserves praise for that. There are only two other characters of importance: the young lover and the Broad Church clergyman. Mr. Leonard Boyne represents the first very well, and Mr. Markby acts the second better than he looks him. The piece, then, is well played—sensibly, intelligently, yet with no fine finish or fine impulse. As these people pass before you, you watch the puzzle out, hardly touched by any one's fortunes, but interested in all.

FREDERICK WEDMORE.

The Lady of Lyons, which was performed at last Saturday's *matinée* at the Gaiety, will be repeated at the same place to-day. Every one was glad to see Mr. and Mrs. Kendal on the London stage again, though a more sympathetic part than that of Pauline might have been wished for the actress.

The Two Roses has come at a quick pace to its end at the Vaudeville. A few weeks since it seemed immortal, there; but now it is gone, and its place to-night will be filled by Mr. Byron's new comedy.

ONE pantomime has disappeared already—that at the Holborn Amphitheatre, where *Cinderella* has been withdrawn, and the classic *Madame Angot* come to the rescue.

ON Thursday evening—too late for any notice in our columns this week—a new comedieta was to be brought out at the Court Theatre; Miss Marie Litton playing the principal part.

FOR one melodrama the Adelphi has substituted another. *A Prayer in the Storm* is succeeded by *A Dream at Sea*. The author does not count for much in these pieces, where the scene-painter and machinist are persons of importance. Mr. James Fernandez, Miss Hudspeth, and Miss Stuart are among the chief performers in the melodrama now performing.

MDLLE. MANETTI plays Clairette in *La Fille de Madame Angot* at the Philharmonic, and Lange is played by Miss Katrine Monroe, who played it last at the Gaiety. The performance is in no way a remarkable one, but may draw people during a few weeks of the holidays.

THE last performances of *Two Orphans* are taking place at the Olympic, where Mr. Alberty's new comedy is ready to succeed the famous melodrama.

CHARLES SELBY's funny little piece, called *Drawing the Line*, is brightly played at the Charing Cross Theatre, before Mr. Wilkie Collins's drama, which is noticed duly in another place. Mr. Macklin, Mr. Charlton, Miss Edith Lynd, and Miss Burney are the performers of the farce.

M. PIERRE BERTON, it is stated, has been offered by the new manager of the Paris Vaudeville an engagement sufficiently brilliant to induce him to leave the Théâtre Français. A good thing, this, for the frequenters of the Vaudeville, who will thus see one of the best young leading actors on the Paris stage. During his stay at the Français, Pierre Berton's light has been under a bushel. They have given him bad parts and unsuitable parts to play, and no one has gained thereby. At the Vaudeville, where no long-established rights of other people will block his way, we may expect more than a repetition of the success which he obtained at the Odéon. His performances at the "second Théâtre Français," in *Le Bâtard*, in *L'Autre* of George Sand, and *Le Rendezvous* of François Coppée, will always afford pleasant recollections to those who witnessed them.

COMMERCIALY, the year at the Théâtre Français has been one of the utmost prosperity. The receipts have never been as great as in the twelve-month just passed. But when it is remembered that the sensational performance of the *Sphinx* contributed as much as anything to the financial success, the result will not seem to be one so very worthy of congratulation. Latterly *Le Demi-Monde*, accepted by all Paris critics as the master work of Dumas, has maintained the receipts of the theatre at a high level. The *Chaine*, of Scribe, has been less popular, and the revival of *Phèdre* was undertaken with an intention purely artistic.

GEORGE SAND'S *Marquis de Villemer*—her best contribution to dramatic literature—was performed at the *Gaité* *matinée* last Sunday; Porel, Talien, Léonide Leblanc and Blanche Baretta, of the Odéon, taking the principal parts.

La Vie Infernale, a drama by Georges Richard, from a romance of Gaboriau's, has been produced with fair success at the Théâtre de Cluny.

THE *Débats* devotes a good deal of space to the discussion of the prospects and position of a very important Paris theatre—the Vaudeville—which hopes by the appointment of a new manager to have seen the last of its bad days. "It has passed," says the *Débats*, into new hands. "La tâche est lourde, mais ni l'intelligence ni le courage ne manquent aux hommes qui l'ont acceptée. Ils auront tout d'abord à lutter contre des difficultés de toute nature, car ils prennent possession d'une maison en quelque sorte démeublée, où tout manque. La désorganisation est complète: pas de répertoire, pas de troupe, au sens vrai du mot, et avec cela le préjugé défavorable qui s'attache à un théâtre 'enguignonné' depuis longtemps, si l'on peut employer ce mot. Les choses ne sont pourtant pas désespérées, et l'on a vu des malades revenir de plus loin. Le Vaudeville a un passé glorieux, et son nom seul évoque les plus brillants souvenirs. Que d'auteurs et d'acteurs célèbres ont fait son illustration! Il a toujours compté au premier rang parmi nos scènes de genre nécessaires, et un tel théâtre ne saurait disparaître."

SPEAKING of the dramatic year just passed in Paris, M. Caraguel, who seems above the consideration of popular successes, says: "The theatrical year just dead has not been marked by any memorable event. Things have followed their accustomed train. New works have been numerous, but none has risen above an honest mediocrity."

MUSIC.

MONDAY POPULAR CONCERTS.

THOUGH the first concert since Christmas, which took place last Monday, offered no absolute novelty in the instrumental portion of the programme, it was noteworthy for the first appearance at these entertainments of one of the best pianists now before the public—Mdlle. Marie Krebs. To her, therefore, the place of honour should be given in this notice. Mdlle. Krebs is a pleasing, though unfortunately not very common, example of a wonderful child who has developed into a still

more wonderful young woman. In the case of infant prodigies there is always more or less reason to dread the fate of the immortal Mr. Toots, and to fear that a remarkable gifted childhood may be followed by a, to put it mildly, very commonplace maturity. Happily, however, both for Mdlle. Krebs and for our musical public, she has proved an exception to the too frequent rule. With years, her intellect as well as her fingers have developed; and she has come back to us now no longer a remarkable child, but a finished artist. She paid a visit to this country last season, after the conclusion of the Monday Popular Concerts, which accounts for the fact of the present being her first appearance there. She selected for her solo Bach's Prelude and Fugue in A minor, entitled in the programme "Alla Tarantella." It would be interesting to know by whom this title was given; it is certainly not due to Bach himself; it is indeed doubtful whether in his time the old dance, which was originally in common time, had assumed its modern form and rhythm at all. Some modern editor has probably re-christened it because the subject happens to be in triplets; but there are several other of Bach's fugues which might just as correctly bear the same name. Apart, however, altogether from this point, the fugue is one of the old master's finest and most genial works, and the prelude which precedes it is perhaps even more beautiful. Both are excessively difficult; but Mdlle. Krebs has arrived at that enviable stage of proficiency in which no such thing as difficulty any longer exists for her. Of her performance on Monday it is simply impossible to speak too highly. The distinctness of her passages and the clearness of her phrasing—the first requisites in Bach's music—were absolutely perfect; nor with all this mechanical accuracy was there, as sometimes happens, any hardness or frigidity. The expression was all that could be desired; and the effect upon the audience of her truly marvellous performance was so great that nothing less than three recalls would satisfy them. In Beethoven's great trio in B flat (with Herr Straus and Signor Piatti), Mdlle. Krebs showed her competency as an exponent of concerted music; while the concluding number in the programme, Schubert's Fantasia in C, Op. 159, was another piece of wonderful execution. This very fine work is one of the few by its composer the date of which is unknown. From the internal evidence of style, one would be inclined to class it among Schubert's later works. It possesses the same breadth of development, boldness of modulation, and melodic charm as the Rondo in B minor (also for piano and violin) or the two pianoforte trios, all of which works were produced in the last years of their composer's life. Owing to the great demands it makes on both players, it is but seldom heard in public; such a performance, therefore, as it received from Mdlle. Krebs and Herr Straus was a genuine treat to the Monday Popular audience. The opening number of the programme was Mendelssohn's early quintet in A, a truly remarkable work for a lad of seventeen, but showing occasionally (a very rare thing with Mendelssohn), some tendency to diffuseness. Notwithstanding this, the charm of the subjects and the skill with which they are treated is so great that the work will always be heard with interest. It was performed by Messrs. Straus, L. Ries, Zerbini, Burnett and Piatti; and though Herr Straus seemed not altogether at his ease (being apparently troubled with a refractory "first string"), the rendering was an excellent one. The vocalist was Miss Edith Wynne, and Mr. Zerbini conducted.

Next Monday will be a "Mendelssohn night," when Mdlle. Norman-Néruda is announced as leader, and Miss Agnes Zimmermann as pianist.

EBENEZER PROUT.

THE Crystal Palace Saturday Concerts will be resumed this afternoon, after the usual Christmas recess. From what we learn of the projected

arrangements, there is every reason to expect that the remaining concerts of the season will be fully equal in interest and instructiveness to those that have already taken place.

THE Royal Albert Hall Concerts are to be recommenced on Thursday next, the 21st—not on the 19th, as originally proposed, and announced in our columns last week. At the first concert the great violinist Herr August Wilhelmj will make his first appearance for several years in this country. The event will be one of interest, as Herr Wilhelmj is ranked by many German musical critics as equal, and by some as even superior, to Joachim.

THE last number of the *Revue et Gazette Musicale de Paris* contains a long article from the pen of M. Adolphe Jullien on the opening of the New Opera House. The critic very justly blames the management for giving a series of selections instead of some representative work. He says that they "transformed into a gala evening worthy of being offered to the Shah of Persia this solemn inauguration, which might have been a sort of musical festival, and of homage offered to the masters of genius who have for two centuries adorned the French opera." He adds that "the inauguration of the Opera, as it took place, has appeared to deny the musical history of France, and to ignore the glorious part played by our country in the development of dramatic music." He nevertheless speaks with high praise of the *débutante*, Mdlle. Krauss, who in two acts of *La Juive* showed the possession of great dramatic and lyric power.

It is interesting to note how German music seems at length to be making its way in France. At the last concert of the Conservatoire, three movements from the "Credo" of Bach's great Mass in B minor were included in the programme; while at M. Padeloup's popular concert on the same day, Brahms's Serenade in D was to be produced for the first time. Last Thursday the *Messiah* was announced, under the direction of M. Lamoureux, our excellent artist, Mdlle. Patey, being engaged for the contralto music.

WEBER'S *Oberon* has just been produced for the first time at Bordeaux, with great success.

A FRENCH Opéra Comique company has been performing with considerable success at Singapore.

ROYAL GEOGRAPHICAL SOCIETY.

THE CAMERON EXPEDITION FUND.

1 SAVILE ROW, LONDON, W., January 4, 1875.

LIEUTENANT VERNEY L. CAMERON, R.N., Leader of the Livingstone East Coast Aid Expedition, under the direction of the Royal Geographical Society, has, since the attainment of the primary object of his journey, surveyed the unexplored portion of Lake Tanganyika, and he reports that he has discovered the outlet of that great reservoir. He is now attempting to reach the Atlantic coast by following the course of Dr. Livingstone's Lualaba, which he believes to be the Congo; a perilous, arduous, and most expensive enterprise. It has been determined by the Council of the Royal Geographical Society to appeal to the Fellows and the Public for Subscriptions to meet the considerable expense of so great an undertaking.

Subscriptions will be received for the "CAMERON EXPEDITION FUND" by Messrs. RANSOM, BOUVERIE & Co., 1 Pall Mall East; Messrs. COCKS, BIDDULPH & Co., 43 Charing Cross; and at the Rooms of the Royal Geographical Society, 1 Savile Row, W.

SATURDAY, JANUARY 23, 1875.

No. 142, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

A Letter addressed to His Grace the Duke of Norfolk on occasion of Mr. Gladstone's Recent Expostulation. By John Henry Newman, D.D., of the Oratory. (London: B. M. Pickering, 1875.)

In the noble poem which Wordsworth dedicated to the last of the popular risings on behalf of the old faith, he does not find the fundamental tragedy of the situation in the hopelessness of the effort, or in the wholesale calculating ruthless cynicism with which its failure was punished, a cynicism far more revolting to the historic conscience than the short-sighted rigour with which Mary, merciful to her own enemies, punished the ten or twelve score of preachers, and yeomen, and craftsmen, and women, who persisted in repeating the stupid blasphemies in which they had been trained. He finds it in the forced abstention of a spirit doomed to cleave

"To fortitude without reprieve,"

a passive spectator of a strife in which it can take no part, and can only say—

"Farewell all wishes, all debate,
All prayer for this cause or for that."

And this tragedy is reproduced by the events of our own time, not in a young maiden whose helplessness, however pitiful, is only natural, but in learned and venerable men used to make themselves felt in the world by their authority and their arguments, who could speak their whole minds and be listened to, and now are left in mournful isolation, as if they hardly knew what to say or even what to wish. Dr. Newman on one side, and Dr. Döllinger on the other, stand apart between the hosts who are fighting over the Vatican decrees, divided from the combatants and from one another. Dr. Newman, at any rate, still keeps his faith and courage. "His eye is not dim, nor his natural force abated;" in his latest work, which he expects to be his last, he pushes back the exaggerations and excesses of Mr. Gladstone's parliamentary rhetoric with the old mastery of slow irresistible strength, and with an air of grave dignified regret of reproachful compassionate surprise, that makes one ashamed of having found his opponent simply ridiculous, and the echo of his accusations a reproach to our national good sense. And yet the clouds return after the rain, and yet the last echo of his voice in our ears is the echo of a dirge:—

"αἰλινον αἰλινον ἵπτι, τὸ ἔ' εὐ νικάτω."

Perhaps we are wrong to pity him; all his own pity is for others; he has pity to spare even for the people to whom it is still a

painful deception to find that Bishop Doyle's pledges about the infallibility of the Pope were worthless: it is a judgment on us for not keeping up direct diplomatic intercourse with Rome, where we should have heard that the Pope was infallible fifty years ago: it serves us right. Still it is a heavy judgment; it is natural we should feel it.

"A great Council has been called; and as England has for so long a time ignored Rome, Rome, I suppose it must be said, has in turn ignored England. I do not mean of set purpose ignored, but as the natural consequence of our act. Bishops brought from the corners of the earth in 1870—what could they know of English blue-books and parliamentary debates in the years 1826 and 1829? It was an extraordinary gathering, and its possibility, its purposes, and its issue, were alike marvellous, as depending on a coincidence of strange conditions, which, as might be said beforehand, never could take place."

As to the essence of the subject, Dr. Newman begins by reminding us that the Catholic hierarchy has always been liable to come into collision with the State, and insists that the chance of such collisions has rather been diminished than increased by the centralisation of the largest and soundest portion of that hierarchy under the successors of St. Peter; while those portions of the hierarchy which escaped, or refused that centralisation, certainly give the State no trouble, because they have lost their independence. It may be so, and yet one thinks there is a difference. We sympathise with St. Ambrose shutting the church to Theodosius with a moral enthusiasm; we sympathise with St. Basil in his contest with Constantius with a moral or a theological enthusiasm, according as we share his creed or no; it is quite possible to sympathise with Pius VII. excommunicating Napoleon I. for confiscating his States; but it will be with a purely political enthusiasm. The independence of the hierarchy is so indispensable a means to so much good, that it is intelligible that since the days of St. Gregory VII. it should have been pursued as an end in itself, sometimes it may be at the expense of higher ends, and this is certainly a danger which the centralisation of ecclesiastical action has tended to increase.

In dealing with the question of divided allegiance, Dr. Newman brings the matter in a delicate dignified way to the point to which it had been brought already by the bluff masculine sense of a right honourable member for Philistia. The occasions on which in England (or any other civilised State) a man will have to choose between obeying the law and obeying the Pope are happily very rare, and it is a criminal folly wantonly to speculate upon them in advance. He even carries the matter farther than Sir William Vernon Harcourt could have done, for he lays down two imaginable cases in which a pope might bid English Roman Catholics to break the law, and yet it would be duty to obey it. The cases are those of soldiers and sailors already engaged in a war not disapproved by their own consciences and condemned by the Pope, and that of a Roman Catholic Privy Councillor, if he takes, as Dr. Newman believes, an oath not to recognise the succession of a Roman Catholic Prince of Wales. This is justified by quotations from unquestionable Roman Catholic

authorities on the practical supremacy of even an erroneous conscience. And then comes a most splendid and solemn panegyric on conscience in its strength and in its weakness; conscience which has been attacked by one set of the Pope's enemies, and abused against him by another:—

"The rule and measure of duty is not utility, nor expediency, nor the happiness of the greatest number, nor State convenience, nor fitness, order, and the *pulchrum*. Conscience is not a long-sighted selfishness, nor a desire to be consistent with oneself; but it is a messenger from him, who, both in nature and in grace, speaks to us behind a veil, and teaches and rules us by his representatives. Conscience is the aboriginal Vicar of Christ, a prophet in its informations, a monarch in its peremptoriness, a priest in its blessings and anathemas, and even though the eternal priesthood throughout the church could cease to be, in it the sacerdotal principle would remain and would have a sway."

"All sciences except the science of religion have their certainty in themselves; as far as they are sciences they consist of necessary conclusions from undeniable premises, or of phenomena manipulated into general truths by an irresistible induction. But the sense of right and wrong, which is the first element in religion, is so delicate, so fitful, so easily puzzled, obscured, perverted, so subtle in its argumentative method, so impenetrable by education, so biased by pride and passion, so unsteady in its flight, that, in the struggle for existence amid various exercises and triumphs of the human intellect, this sense is at once the highest of all teachers, yet the least luminous; and the Church, the Pope, the hierarchy are, in the Divine purpose, the supply of an urgent demand. Natural religion, certain as are its grounds and its doctrines as addressed to thoughtful, serious minds, needs in order that it may speak to mankind with effect, and subdue the world, to be sustained and completed by Revelation."

Consequently "the Pope, who comes of Revelation, has no jurisdiction over Nature." It is possible that his censures may be unjust, at any rate they are fallible. There is much to be said on this. In the first place—as would soon be clear if all Protestants wrote as accurately as Dr. Newman or even as Mr. Fitzjames Stephen—the real gravamen is not that the Pope's authority will make Roman Catholics break the law, but that it will make them dislike and disparage it and hinder legislation—and this, no doubt, is rather a grievance of politicians and journalists than of the public at large. In most things people are better subjects for practising an old and admirable religion strictly; but precisely the things in which a strict Roman Catholic is likely to be troublesome are the things about which Liberal politicians and journalists are nowadays most eager. In the second place, the principle of authority, which is largely and happily illustrated, is hardly quite so absolutely extinct among Protestants as Dr. Newman represents it: there are institutions and principles which all serious thinkers deliberately refuse to call in question. People still look up for guidance, with not unsubmissive trustfulness, to those who fill great positions with dignity. And it hardly seems as if Dr. Newman's distinction—that any act of life may be made the subject of Papal regulation, but that nothing like every act will or can be—quite meets the feeling which underlies Mr. Gladstone's heated rhetoric about the mental and moral slavery of converts.

When people have no formed habits of moral judgment, they are glad to refer any difficult question to external authority, as the Franks asked the Pope whether it would not be better to make the man who did the King's work king; when they have formed habits of moral judgment, an external authority is apt to be an encumbrance; a newly recognised authority may leave men's actions free, or only control them as they feel for their good; but it cuts rudely across their preferences and admirations and opinions, in which most men feel themselves freer than in their actions. To examine the doctrine of conscience, the latest and most brilliant expression of which is found in the work before me, would require a substantive treatise; but if it is adopted, the result will be that an obscure theory of natural history adopted from Bishop Butler, who made conscience a faculty, by both the schools of English piety that have flourished since then, will have developed into an important theological doctrine.

The Encyclical of 1864, as Dr. Newman points out, is in one sense little more than a reassertion of the doctrines of Toryism, which he remembers to have seen in practice, and which a younger generation may still find embalmed in the hospitable pages of Blackstone; and a condemnation of extreme and absolute assertions about liberty of conscience and the press, to which no serious politician, at least in England, would commit himself. The question whether Papal Infallibility is pledged to the Syllabus which accompanied the Encyclical, turns upon whether "hisce litteris" refers to the Encyclical letter exclusively, or includes its enclosure. Papal Latin is a difficult and little known language. Dr. Newman decides in the negative, and so is able to make full use of the very considerable difference between the tone and effect of the different documents from which the Syllabus is compiled, and the effect of the Syllabus itself. Altogether the condemnation of eighty such propositions is startling; but when each condemnation, or the passage from which each condemnation is inferred, comes to be examined in its context, not much is left to shock moderate Conservatives.

In pursuance of the same charitable object of minimising the difficult duty of intellectual belief, the author discusses the Vatican Council and the Definition with which it closed. The discussion is prefaced by an explanation of the author's personal position, about which rumour was so cruelly busy at the time. Two letters are given, dated July 24 and 27 (the dogma was proclaimed on July 18), where the writer appears chiefly busied in finding considerations which would make the doctrine binding even if the episcopal minority, by their persistent opposition, should invalidate the moral unanimity of the Council. It is certainly true that, both in freedom and unanimity, the Council of the Vatican compares not unfavourably with the Council of Ephesus. A more serious charge is put by Mr. Gladstone in the exaggerated shape that the Council of the Vatican "repudiated" history in the act of appealing to the past of the Church. Dr. Newman's theory of the matter is that no Catholic doctrine is fully proved or dis-

proved by history; that the anathema of the Sixth Council, even if it was intended for the person of Honorius, does not touch his infallibility, since the letters to Sergius were not meant for the instruction of the universal Church; and that, if more has been found in the promises to Peter than the Fathers found there, the progress of doctrine is amply covered by a well-known and weighty passage in Butler's *Analogy*. This is followed up by a very masterly, very guarded, and very candid exposition of the view that a Pope is sure to be right in his decisions on faith and morals. After all, in the long run, such decisions decide so very little, it is so possible to correct what they seem to have decided, and the power of deciding (guaranteed not by inspiration, but by *assistentia*) has so little of the supernatural about it. Yet the doctrine is not explained away:—

"To be a true Catholic, a man must have a generous loyalty towards ecclesiastical authority, and accept what is taught him with what is called the *pietas fidei*; and only such a tone of mind has a claim—and it certainly has a claim—to be met and to be handled with a wise and gentle *minimism*. Still, the fact remains that there has been of late years a fierce and intolerant temper abroad, which scorns and virtually tramples on the little ones of Christ!"

This protest is often repeated and oftener presupposed throughout the essay, and is, perhaps, the point in Dr. Newman's argument which it is hardest for an outsider to follow.

One can understand the old notion of civil and religious liberty that normal humanity (redeemed, converted, or elect) was to be left to find its own way through the world, while the aberrations of depraved humanity were severely checked; one can understand the thought that man is so frail and the world so perplexing as to make it necessary to hold fast to a tradition guarded by a teacher whose solemn utterances are infallible, while the *pietas fidei* is due to his lightest. But it might well seem that when the claims of such a teacher had once been heartily admitted, the one mood in which minds of merely ordinary strength and ordinary patience could be comfortable would be the mood of shrill, resolute, feminine fervour, which essays to take up the mantle of the prophets who cursed Meroz, and seeks to abound in the sense of the Pope whose great acts have been the Definitions of 1854 and 1870, and the Encyclical and the Syllabus—all, no doubt, acts of pure disinterested zeal; but, as Dr. Newman has taught us that such zeal may have all the effects of policy, we may venture to say that the policy of Pius IX. has been to meet aggression by defiance, almost by provocation; things have been going against him, but he has chosen to play a bold game instead of a cautious one; he has played it with great spirit; he has kept it up very long,—

"Per damna per caedes ab ipso
Ducit opes animumque ferro."

But Dr. Newman refuses so to interpret the Pope; and that makes one feel it a presumption to interpret Dr. Newman. With a mind of no ordinary patience, of no ordinary strength, he has imbibed from the first the

noble motto which the Rome of the Consuls bequeathed to the Rome of the Popes—

"Parcere subjectis et debellare superbos."

He has not always practised it in the same proportion: he studied at Oxford and Littlemore *debellare superbos*; he studies *parcere subjectis* now—then, as now, almost alone.

G. A. SIMCOX.

The Great Tone-Poets. By F. Crowest. (London: Bentley & Son, 1874.)

THE author of this volume of biographies states in his preface that some of the series originally appeared in a now defunct periodical entitled the *Et Cetera Magazine*, and further, that these papers, re-dressed, with additional biographies, are given to the public in compliance with many requests from "teachers of music." It must be confessed that without this guiding information it would have been impossible to guess what audience Mr. Crowest imagined himself to address when penning these memoirs of musicians, whom, with a certain musical Germanism, he is pleased to call the "Great Tone-Poets." The "teachers of music" who were so struck by Mr. Crowest's articles in the *Et Cetera Magazine* may hail the appearance of his book, and gratefully accept the additional advantage offered by the small list of dates affixed to each chapter, also the very ample and telling tables of contents. Yet if a book of this cast is to be taken as sample of the works "used by those engaged in examinations," the pupils must needs be in poor training. Plenty of amusing anecdotes, a date or two, a number of names of operas and other compositions, a vague notion that all classical music is "sublime," though it may sometimes be dry, and that Robert Schumann "stepped over an accepted boundary," and in some way or other began the music of "the Futurists," because "he is the most advanced, the most difficult to understand"—this certainly is a fair example of what pupils examined by teachers in a text-book of this order would bring up as result of their studies.

I should be truly sorry to do the author injustice. Mr. Crowest has been at great pains to gather from various sources a quantity of readable information. The subjects are well chosen, viz., Bach, Handel, Gluck, Haydn, Mozart, Beethoven, Spohr, Weber, Rossini, Schubert, Mendelssohn, Schumann; the memoirs bristle with piquant anecdotes; the author is enthusiastic past discrimination—from Bach to Schumann he keeps our admiration at fever heat; in short, the general reader, for whom the work is supposed to be rendered "popular," will certainly find amusement and some instruction.

Yet must this book fail to satisfy any audience. The advanced student of music will needs find it inadequate and gossiping, while for beginners the author takes for granted too much acquaintance with forms of music and the history of musical instruments. As example, the volume begins bravely with Sebastian Bach. "Within the narrow circle of music," writes Schumann in 1840, "art owes to Bach what religion owes to its founder." We have here a fairly interesting sketch of the patriarch's

early struggles and subsequent success, enthusiastic panegyric on his music, and a somewhat systematic enumeration of his compositions. But no life of Bach—not even a brief memoir of thirty pages—can be considered satisfactory that presents no indication of the state of the musical world at the time he arose “a prophet in Israel,” no account of the nature of the instruments for which he wrote, and how their imperfect or peculiar mechanism influenced both the form and style of his compositions. To talk of Bach’s piety is pleasant, but to point out the especial character which the Lutheran mode of worship gave to the composer’s sacred works, would have been more to the point. Moreover, beyond one mention of Wilhelm Friedemann, there is no account of the remarkable circle of musical sons and descendants who were the first-fruits of the great master’s teaching. Such shortcomings as these beset the companion biographies. Without some information about instruments as well as players, a great deal of inflated language over this and that composition or performance goes for nothing. Moreover, is it not a mistake in so popular a book as this to use technical expressions and the names of musical forms without indication of their meaning? Terms such as “thick and heavy orchestration,” “little inventions and deviations which Schumann has made so completely his own,” “superb and masterly scoring,” “thin pianoforte music,” and so on, savour too much of that use of easily-acquired technicalities which besets a holder of the proverbially dangerous “little knowledge,” and are Hindostanee to the ordinary reader. Of what avail again, I would venture to ask Mr. Crowest, is the oft-repeated statement that each composer was opposed for innovations and novelties—a fact true and pregnant with significance—unless accompanied by explanation in what the novelty consisted. Haydn, we are told, “unfettered by the rules and trammels of any school or master, followed the bent of his own inclinations . . . and to a great extent revolutionised instrumental music.” Mozart made “surprising and successful innovations, and rid himself of the accepted trammels and formalities to which opera till then had been subjected;” “notable is Beethoven’s . . . total disregard of the rules of writing.” This mode of generalisation is most misleading, even when it is not absolutely false. The simple-minded reader, uninformed by his author what was the nature of Haydn’s revolution, Mozart’s innovations, and Beethoven’s evident rank rebellion, would gather the notion that the great giants of music distinguished themselves by their destructiveness, that each in turn threw down the work of his predecessor to raise his own edifice on the ruins; that, in short, genius was made manifest by revolution. An honest writer as Mr. Crowest appears to be, would do well to avoid helping this popular fallacy by general statements such as those quoted. He must know that music, the latest born of the arts, has grown in the hands of the great masters by development, not by accident—by addition, not by subtraction.

To do Mr. Crowest full justice, he does not often err on the side of over-learned and

technical writing; his criticism may be considered emotional, descriptive, fanciful, only not profound; it is, moreover, couched in very singular English.

Despite commissions and omissions these biographies have one virtue—they are not dull. The strong individuality, or what Mr. Crowest would call the “unique originality” of character, in the great musicians, gives emphasis to the interest of their lives, the tale of their struggles and successes abounds in dramatic points. Little Sebastian Bach copying by moonlight the stolen book of clavichord pieces which his elder brother will not lend him; Hadyn acting valet to old Porpora in return for lessons; Rossini in bed writing over again the score of part of *L’Italiana in Algeri*, because he is too lazy to get out and pick up the fallen sheets, or shrugging his Italian shoulders at the audience that storms disapproval of his *Barbiere*; Mozart singing his own *Requiem* on his death-bed; grand, deaf Beethoven turned round by friendly hands at the conductor’s desk that he may see the audience he cannot hear, clapping and screaming their delight in his Ninth Symphony; Schubert scribbling divine melodies out of a sad soul on scraps of paper at a Vienna beer-house amid clatter of glasses and tongues—incidents like these give charm to the biography, and bring out into picturesque relief the character of musicians. From the available resources of anecdote Mr. Crowest has gathered many good stories, taken direct from the foreign text, it may be surmised, as they often read like translations.

So little effort has been made hitherto by English writers to bring music intelligibly home to the general public, that it behoves us to be thankful for small mercies, and to welcome Mr. Crowest’s well-meant effort. Should *The Great Tone Poets* reach a second edition, perhaps the author may remember the apothegm of Bacon that “discretion in speech is more than eloquence.” Grouped against a sound historic background, denuded of frothy and chaotic panegyric, and written in clear English, these memoirs might yet fulfil a useful and worthy mission.

A. D. ATKINSON.

The Paston Letters. Edited by James Gairdner. Vol. II. (London: Edward Arber, 1874.)

It is fortunately no longer necessary to introduce either the Paston Letters or their editor to the world. When the controversy stirred up by the late Mr. Herman Merivale ended not only in the production of conclusive proof of the authenticity of that celebrated collection, but in the discovery of a large number of unprinted letters and documents properly belonging to it, it was felt that the time had come for a new and complete edition of the whole correspondence, while it was not so certain that a really competent editor would be found for letters written in a period which is probably less attractive to the student than any other in our annals. The announcement of Mr. Gairdner’s name, however, set at rest any doubts that may have been felt on this score, and his unique knowledge, alike of the details and of the general bearing of the events

of the epoch, has been thus for the first time utilised for the benefit of his readers.

Taking therefore for granted at this stage of his work, that we have to deal with a good book well edited, it may be worth while to ask what lessons we learn from this second volume, which reaches from the seizure of the crown by Edward IV. in 1461, to his recovery of it in 1471, after the battle of Barnet. In its pictures of domestic life, indeed, we have nothing to equal the *annals* of Margaret Paston’s thoughts of her husband when he was lying sick in London, as we find them expressed in the earlier volume: “If I might have had my will, I should have seen you ere this time. I would ye were at home, if it were for your ease, now liever than a gown, though it were of scarlet.” Nor do we here get so close a peep into the miseries attending the education of the young, as when we hear of a young lady that “she had since Easter the most part been beaten once in the week or twice, and sometimes twice in one day, and her head broken in two or three places.” No wonder Elizabeth Paston sighed for liberation from domestic thralldom, even by marriage with an elderly suitor. She had learned too to have an eye to the main chance. She was “never so willing to none as she is to him, if it be so that his land stand clear.”

The second volume, however, reminds us that a way to escape from such thralldom was then open to young ladies which is now closed to them. Margery Paston fell in love with Richard Calle, her brother’s bailiff. The whole family was up in arms against the girl who proposed to disgrace it by so disparaging a match. Another brother expressed the opinion of the domestic circle when he said: “That an my father (whom God assoil) were alive, and had consented thereto, and my mother and ye both, he should never have my good-will for to make my sister to sell candle and mustard in Framlingham.” In our days such a barrier would probably, except in the case of a very strong-minded woman indeed, have proved insuperable. In the fifteenth century the difficulty could be surmounted with the least possible effort. The bishop had merely to be informed that Margery and her lover had mutually promised marriage to one another. When the bishop had convinced himself that this was the case, the marriage ceremony had to follow as a matter of course.

From these lighter matters we may turn to those domestic difficulties which lay at the root of the political changes with which the atmosphere was full in the years in which the royal authority began to establish itself after the long anarchy of civil war. If we want to understand how Edward secured his throne, and even to understand how there came to be a Tudor despotism with a reinforced Court of Star Chamber and other apparatus of authority, we cannot do better than study the history, as it is here revealed, of the inheritance of Sir John Fastolf.

Fastolf’s heir was John Paston, the husband of the notable lady who loved him even better than a scarlet gown. He was bound by the will to establish in Caister Castle, Fastolf’s own mansion, a college of religious men to pray for his benefactor’s soul. But in those days might was right,

and the Duke of Norfolk, fancying that he should like the house for himself, quietly took possession of it. At that time Edward was just seated on the throne, and Edward had just been reported to Paston to have said in reference to another suit, that

"he would be your good lord therein as he would to the poorest man in England. He would hold with you in your right; and as for favour, he will not be understood that he shall show favour more to one man to another, not to one in England."

Mr. Gairdner—and no one is better qualified to judge—thinks that this was a true expression of the King's intentions. But either he was changeable in his moods, or during these early years he was hardly settled enough on the throne always to be able to carry out his wishes. This time, however, in some way or another, the great Duke was reduced to submission, and Caister was restored to Paston.

In 1465 a new claimant appeared; and claimants, though as troublesome in the fifteenth as the nineteenth century, proceeded in a different fashion. This time it was the Duke of Suffolk who asserted a right to the manor of Drayton in his own name, and who had bought up the assumed rights of another person to the manor of Hellesdon. John Paston was away, and his wife had to bear the brunt. An attempt to levy rent at Drayton was followed by a threat from the Duke's men that, if her servants "ventured to take any further distresses at Drayton, even if it were but of the value of a pin, they would take the value of an ox in Hellesdon."

Paston and the Duke alike professed to be under the law. But each was anxious to retain that possession which in those days seems really to have been nine points of the law. The Duke got hold of Drayton, whilst Hellesdon was held for Paston. One day Paston's men made a raid upon Drayton, and carried off seventy-seven head of cattle. Another day the Duke's bailiff came to Hellesdon with 300 men to see if the place were assailable. Two servants of Paston, attempting to keep a court at Drayton in their master's name, were carried off by force. At last the Duke mustered his retainers and marched against Hellesdon. The garrison, too weak to resist, at once surrendered.

"The Duke's men took possession, and set John Paston's own tenants to work, very much against their wills, to destroy the mansion and break down the walls of the lodge, while they themselves ransacked the church, turned out the parson, and spoiled the images. They also pillaged very completely every house in the village. As for John Paston's own place, they stripped it completely bare; and whatever there was of lead, brass, pewter, iron, doors or gates, or other things that they could not conveniently carry off, they hacked and hewed them to pieces. The Duke rode through Hellesdon to Drayton the following day, while his men were still busy completing the wreck of destruction by the demolition of the lodge. The wreck of the building, with the rents they made in its walls, is visible even now." (Intro. xxxv.)

The meaning of all this is evident. We have before us a state of society in which the anarchical element is predominant. But it is not pure anarchy. Men have a sense

of the duty of submission to the law. We hear of long pleadings in Westminster Hall, of sheriffs issuing replevins, and of decisions given by judges and bishops. But this legal machinery, though powerful in small matters, is powerless in things of greater importance. It can save a cow or deliver a bailiff. It cannot prevent a manor house from being wrecked. Again and again we perceive how the eyes of those who are wronged turn towards the King. Once the owners of a ruined house contrive that Edward in his passage near shall turn aside to view the mischief, in order that he may be moved to redress the wrong. Plainly, there is a notion abroad that a strong and powerful king who will make laws respected is the real remedy for the evil. How this wish was satisfied, the annals of the Tudor reigns testify.

In short, the usual explanation that the dread of a renewed civil war was the main cause of the growth of despotism is insufficient. It was rather the abuse of power on the part of the baronage, and the anarchy resulting from it, which first produced the civil war, and then made a sharp remedy inevitable.

SAMUEL R. GARDINER.

Western Wanderings; a Record of Travel in the Evening Land. By J. W. Boddam-Whetham. Illustrated. (London: Richard Bentley & Son, 1874.)

THE opening of the railway across the continent of North America has poured a flood of enterprising travellers into previously inaccessible regions of the Pacific slope; and as a necessary result in this age of ready writers, we have a succession of books on the subject. The once mysterious land of romantic and stirring adventure has indeed been so much visited and so much written about of late, that we are better acquainted with it than with some of the wilder and more remote districts of Ireland or of Scotland. Nothing but the great extent of the country, and the extraordinary richness and variety of the materials which it furnishes for description, has saved the subject from becoming altogether stale and wearisome from too frequent repetition. It possesses vast prairies, the magnificent ranges of the Rocky Mountains, the Cascades, and the Sierra Nevada, with peaks loftier than the Alps, glaciers and mighty cañons, countless lakes and lovely valleys, geysers, and volcanoes. Arizona, Sonora, and New Mexico contain, moreover, numerous archaeological treasures of extraordinary interest, visited many years ago by Mr. Stephens, and more recently by the author of *The Marvellous Country*; extensive districts, once densely populated and highly cultivated, which have now become barren wastes, studded with the ruins of great cities which bear internal evidence of the handiwork of a civilised race of men who have died out, and whose history is lost in obscurity. And then the old glamour of romance still lingers about Western America; it embraces within its vast limits the homes of the fiercest and most untameable of the Red Indian tribes, the Blackfeet, the Modocs, and the Apaches; and that El Dorado, so persistently and vainly sought by the Spanish conquerors of Mexico, to which native tra-

dition pointed (and no doubt correctly) as the chief source of the wealth which flowed into the treasury of Montezuma. Altogether the resources of this region seem sufficient to supply almost any number of intelligent observers with subject-matter of unusual interest.

The author of *Western Wanderings* has not broken much fresh ground. He tells us little that has not been told already by others who have gone before him. Yet he describes what he has seen in a pleasant easy way, and the illustrations by Mr. Whymper are unusually well executed. This makes us regret the more that the author should not have been able to supply sketches of fresh scenes, such as the Mystic Lake or the Lava Beds, in place of the well-known views of the Falls of Niagara.

The earlier portions of the book, which are occupied by an account of the journey by the Pacific Railway to San Francisco, and a visit to Salt Lake City, are less attractive than the subsequent pages which deal with the wilder life and less known scenery of California and Oregon.

From San Francisco Mr. Boddam-Whetham made the inevitable pilgrimage to the groves of great trees, and the celebrated Yosemite valley. The giant trees of California, the *Sequoia gigantea*, are well known in England under the name of Wellingtonias, and in America as Washingtonias. Enormous numbers have been raised from seed, and are found to grow freely and to thrive almost anywhere. It is an extremely curious fact, that this tree, which produces a profusion of seed, and can be propagated artificially with such ease and success, should in its natural condition be limited to one or two secluded valleys on the western flank of the Sierra Nevada. It has not spread beyond a few isolated spots of a few acres in extent during all the hundreds, nay thousands of years it must have flourished there. There is nothing in the world, perhaps, which strikes one as so strange, so utterly beyond all previous experience as these enormous trees when seen for the first time. The banyan and the baobab of the tropics attain a wide-spreading growth which covers a large area. But the effect upon the mind is as nothing compared with that produced by the gigantic trunks of the Sequoia—vast columns of a girth two to three times that of the Monument on Fish Street Hill, and half as high again; while one fallen monarch must have towered up to a height of 440 feet, i.e. twenty or thirty feet higher than the summit of the cross which crowns the dome of St. Paul's.

Still further south along the valley of the San Joaquin, on the Merced River, lies the Yosemite valley. The special features which render this loveliest of all valleys pre-eminently beautiful, are the grandeur of the lofty cliffs by which it is shut in, which rise vertically to a height of from 3,000 to 4,000 feet, and the magnificence of the numerous waterfalls which stream over these great precipices sheer down into the valley below. There bloom an endless variety of brilliant flowers, amid verdant grasses clustering oaks and maples, and scattered rocks rich in ferns and mosses.

Returning to San Francisco, Mr. Boddam-

Whetham made a short stay there, and then turned his face northwards, passing through the fertile plains of the San Joaquin and Sacramento, on his way to Mount Shasta. These rich grain fields of California, we are told, are being rapidly impoverished by the reckless practice of the farmers. The soil receives neither rest nor tillage; even the straw is burnt; so that land which once yielded eighty or one hundred bushels to the acre, gives now but twenty.

Mount Shasta, although surpassed in mere height by Mount Whitney, another peak of the Sierra Nevada, and by several of the loftiest of the Rocky Mountain chain in British territory, is essentially the grandest of all the western mountains.

Its altitude is 14,500 feet, nearly equal to that of Mont Blanc, but the latter is broken into a succession of peaks, while Mount Shasta is one mighty cone of snow and lava rising up out of the plain, stupendous and alone. The varied tints of this mountain are described as of extraordinary splendour, and add beauty of colour to its supreme majesty of size and form. The Indians of that region regard it with superstitious reverence, as the abode of the presiding spirit of their race, from whom, as their legend teaches, they themselves have sprung. Some hundred and thirty miles north of Mount Shasta, in a desert of sage brush and alkali near the Klamath Lake, are situated the curious Lava Beds, the stronghold where the Modocs made their last and, for a long time, successful stand against the United States troops. The defence of the small band of Modocs against overpowering odds was heroic, and would have commanded general admiration, had it not been sullied by the treacherous massacre of General Canby and his companions. It must be remembered, however, that the Indians had received terrible provocation. Forty of their number had been foully murdered by some white settlers a few years before. They had been driven from their favourite homes on to hated "reservations," and were regularly plundered by the Indian agents of the American Government, who, as our author informs us, take for their motto, "Cheat the Indians while the contract lasts."

The Lava Beds are about three miles long by a mile broad, and are bounded on one side by the Tule lake, on the others by rugged hills and mountains. The principal camp of the Modocs was in a bowl-like depression about an acre in extent, with sloping walls rising to a height of a hundred feet. Behind this basin, and on a level with its rim, there stretches, for the distance of about a mile, a flat surface of lava, apparently level and unbroken, but in reality full of small openings, which widen downwards into extensive caves. These caves communicate with one another and with the basin. This series of volcanic caverns formed an almost impenetrable stronghold. The American troops were surrounded and shot down by enemies they could not see, although they could hear them seemingly beneath their feet greeting them with curses and derisive words. Large bodies of soldiers were defeated with heavy loss again and again by the mere handful of Indians. At length some small guns were brought up, the

lava beds shelled, and the troops, advancing slowly and with the utmost caution, encamped on the ground they won step by step. Eventually, Captain Jack, the Modoc chief, and his companions were driven to surrender, and were tried and hanged at Fort Klamath for the murder of General Canby's party.

The scene which seems to have made the deepest impression upon Mr. Boddam-Whetham is the view of the Mystic Lake in the Cascade mountains, a vast crater filled with water of unknown depth, the walls of this huge basin being vertical cliffs of from fifteen hundred to three thousand feet high. From Fort Klamath the author proceeded to Vancouver Island and British Columbia, by way of the Columbia river. He speaks in the highest terms of the beauty of the scenery on that magnificent and picturesque stream swarming with salmon, and of the extensive forests of valuable timber met with in Oregon and Washington. More fascinating still was the impression produced by the lovely Gulf of Georgia, with its transparent waters studded by an archipelago of beautiful islands, shaped by the elements into curious and fantastic forms, and clothed with luxuriant vegetation.

Mr. Boddam-Whetham did not penetrate very far into British Columbia, but he visited the great cañons of the Fraser, the huge chasms in the mountain ranges through which the mighty torrent has forced its way to the sea. He saw, moreover, enough to convince him of the great wealth of the colony in its unequalled timber, its teeming fisheries, and inexhaustible mineral resources of every kind. Time, and the construction of the railway from Canada to the Pacific, will render British Columbia one of the most valuable of the English possessions.

W. B. CHEADLE.

Tales of the Zenana; or, a Nawab's Leisure Hours. (London: H. S. King & Co., 1874.)

THE title of this work is delusive and misleading. The reader is from it naturally led to expect an instalment of tales exhibiting with more or less detail the inner life of an eastern harem. In this expectation he will find himself disappointed, because, with the exception of a somewhat heavy and far-fetched introduction to the tales themselves, and a closing chapter at the end of the second volume, we have failed to discover anything in this work relating to the mysteries of the Zenana. The introduction to these tales is briefly as follows. A certain Nawab on the western coast of India, called Jilal-ud-din, a feudatory apparently of the Moghul emperor, has a grand vizir named Moye-ud-din, who is represented as constantly in the utmost anxiety lest his rival, the Nawab's Kotwal, should supplant him in that potentate's favour. Each vies with the other in endeavours to obtain grace in the Nawab's eyes, and each is also equally desirous of depreciating the merits of his rival. An Arab vessel from the Persian Gulf happens to put into the harbour of the city over which this Nawab holds sway, and an emissary of the vizir chances to become acquainted with the fact that on board

of this ship there is a Persian lady possessing remarkable personal attractions, and, moreover, that the Arab shipmaster is willing for a consideration to part with his lovely charge. The vizir is quickly informed of these circumstances, and the Kotwal, whose myrmidons have been equally vigilant, is also apprised of the new arrival. Both are aware that the Nawab could not be better pleased than by the accession to his harem of this transcendent beauty. Each, therefore, becomes desirous of purchasing the fair Persian from the Arab ship captain for the purpose of presenting her to their master the Nawab. The plots and counterplots of the vizir and Kotwal are related with considerable skill and gusto. Eventually the Persian lady becomes the property of the vizir, who in due course presents her to the Nawab. The Nawab, poor man, finds to his cost and disappointment that he has entered into the domain of feminine caprice, and he is obliged reluctantly to yield to the desire of his fair enslaver, who declines his proffered hand for a time until a favourable conjunction of certain stars takes place. This brings in the astrologers Hindú and Mahomedan, and the interview between the Nawab and the Gurú and his rival Ibn-ul-Ajib is capitally told. The marriage between the Nawab and the fair Persian is put off for a year in accordance with the lady's wishes, for reasons which, however, the reader does not learn until the end of the second volume. She was loved by and betrothed to a Persian noble named Humza (who is absurdly represented as acting like a sun-worshipper, and this in the time of Nadir Shah!); but Humza's brother Zeki Khan, who is also enamoured of Máhtab (the Persian lady's name, which Mr. Hockley strangely spells "Mheitab"), very unkindly interferes and runs off with her, and ships her off to Cambay, intending soon to follow her. Zeki Khan gets rid of his brother and rival in the orthodox Persian fashion, and appears at the Nawab's court towards the close of the second volume. Máhtab, in the hope, vain as it proves, that Humza might "turn up" and claim her, for she is ignorant of his being killed, makes use of various pretences to put off her marriage with Jilal-ud-din, one of these being that for the space of one whole year she is not to behold the face of living man, except the Nawab, who is courteously excepted from the incidence of this sentence. This condition is, unfortunately for the Nawab, broken; for the lady, when out in her palanquin in the cool of the evening, is one day rudely attacked by a band of robbers. The lady is greatly incensed at this insult, and the Nawab's fury and rage is great. We think the *dénouement* of the plot here is weak, for the Nawab, who is about to execute every thousandth man in the city, unless the offenders are discovered, eventually contents himself with the less sanguinary idea of compelling the heads of the different trades and callings each to relate a story for the amusement of himself and for the delectation of the inmates of the Zenana, including the fair Máhtab herself: and thus the tales are introduced. Had the title chosen been "*Tales in a Zenana*," the reader would, perhaps, have been less apt to imagine he was about to hear some sensa-

tional scandals about the private life of the "Andewan." These tales, forming the main portion of the book before us, consist of seven stories more or less long, somewhat after the style of the *Arabian Nights*, of which, indeed, they might be termed a diluted imitation. Mr. Hockley, we dare say, faithfully constructed from the materials he gathered during his apparently not protracted nor over-successful career in India the stories as now presented to the public. The faults of the stories, as stories, are therefore more attributable to the want of skill of the original Indian story-tellers from whom he received the ideas, than to their English editor. But as serious and faithful representations of Oriental thought and taste, they are very incomplete. Probably the original stories Mr. Hockley heard differ as much from the ones under review as an expurgated edition of Lemprière, suitable for young ladies' schools, is unlike the standard edition. We never heard a "kisehgú," or professional story-teller, in Shiraz or Isphahan, relate any story wherein at least one or two situations did not occur which it would be utterly impossible to reproduce in civilised society, but which, nevertheless, were *de rigueur*. No blame can therefore be attached to Mr. Hockley if the present stories in their English dress do not completely represent what doubtless the originals were.

But we now have to notice what we consider unpardonable. It is a fault that occurs more than once in these volumes. The author has fallen into the very egregious mistake of perpetrating jokes which he must have known would be unmeaning in the original, and at best are very poor in English. As an example we will quote the following, where a play on words is attempted which, in English, is not only deficient in wit, but as the work professes, as it were, to be a reproduction of tales originally related in an eastern tongue, is simply absurd.

Buxoo, the barber, is summoned into Moya-ud-din's presence, who thus addresses him (page 140) :—

"Who is the head of your trade, pray? I desire you will repeat to me if he has summoned your *understrappers* for the purpose of making the necessary explanation."

"My lord," replied Buxoo, "you are pleased to be facetious. *Understrappers*, indeed. And who is the head of my trade? Surely, my lord, your own barber must be considered the king of *strappers*."

"Ay, Buxoo, I dare say your wife thought so when you *chastised* her for presenting your petition."

Lord Stanley writes an introductory preface to these volumes, for what reason is not very clear. From him we learn that Mr. Hockley died in 1860, and we cannot, therefore, hold him responsible for the orthography of Oriental names which we find in these tales. Mr. Hockley, or rather his present editor, whoever he may be, retains such old forms of spelling as "Bahander," "hakeem," "Cotwall," etc. But then we meet occasionally with an orthography which is as appalling as is old Purchas' rendering of "Murtaza Ali," by "Mortis Haly," or that which we find in the *Gentleman's Magazine*, in the account of the tragedy of the Black Hole at Calcutta, where "Suraj-ud-dowleh"

is anglicised into Sir Roger Dowley! What in the name of transliteration does Mr. Hockley mean by the form "Mhamud-abagh"? It looks *primâ facie* more like Irish than either Arabic or Persian. When the present editor has been careful to give us Oriental words according to the modern spelling, such as "Hindús," "Tehran," especially also as he has taken the trouble to give foot-notes of the meanings of some of the words and phrases, besides notices on manners and customs—it is surely not extravagant to complain of such gross blunders on the part either of printer or editor as evinced by the spelling of such words, for instance, as "Ead-gar" for "eedgah," or, better, "Idgah."

Mr. Hockley has with doubtful propriety copied Morier in giving to some of his characters names which in the original would be comic. Thus we have Hakeem Nahil and Hakeem Jehil, also Casee Ahmak, in imitation of Haji Baba's protector, Mirza Ahmak, in that worthy's very admirable biography. Why Mr. Hockley should name one of his ladies "Fareebkhash," and give the same appellation to the master of the good ship *Futteh Mubarak*, we cannot pretend to say, unless, indeed, men made shipwreck with the one as much as under the guidance of the other.

Regarding the stories themselves, the best of the seven is, we think, that related by the head of the butchers. The portraiture of Adeeb Khan, the schoolmaster, surrounded by his scholars, is capitally drawn :—

"The school, which was held in the wide verandah of the preceptor's house, was well filled with boys, whose loud and boisterous repetition of sentences, given out by the master, almost stunned the mother of Ashuk. At the upper end of the verandah, on the ground covered with a square mat, squatted Adeeb Khan, wearing a small keemab skull-cap, with his coat open in front and trousers not over clean, holding in his hand a rattan, without which, I believe, no school was ever known to flourish. The heat of the day, together with the assembly of little urchins around their teacher, apparently much oppressed the indefatigable man, who from time to time fanned himself with the leaves of a book, repeatedly applying the tail of his coat (alkolak) to his perspiring brow."

Again we have the miserly father of "Khair Nyat," the heroine in the same story, drawn with much truth. "Hurrees-al-Alghar" is a character frequently met with in the East.

"At this moment a voice from without the gate cried, 'Tél, Tél!' (oil).

"Ah!" cried Hurrees-al-Alghar, "there comes another fellow to add to my ruin." He was about to send him away when his daughter Khair Nyat came from the house saying, "Father, there is the oilman; we want a fresh supply."

"Oil again. Why, had you not three pice-worth yesterday?"

"Yes, father, but it is consumed."

"Consumed! How?"

"I was unwell last night and kept my lamp burning."

"Was there ever such waste and extravagance! Burned a light because you were sick! Could you not be ill in the dark. However," said he, "buy as much as one pice will fetch, and mind and don't waste it." Saying which, he reluctantly pulled from his girdle a small bag, from which he

extracted the money, which having twirled about between his finger and thumb for at least a minute, he gave to his very extravagant child, repeating his admonition of caution and frugality."

It is chiefly on the merits of such delineations of character that this work is of any value.

BERESFORD LOVETT.

Documents relating to the Times of the Interim. ["Briefe und Akten zur Geschichte des Sechzehnten Jahrhunderts, mit besonderer Rücksicht auf Bayerns Fürstenhaus." Erster Band: "Beiträge zur Reichsgeschichte 1546-1551." Bearbeitet von August von Druffel. (München: Riegersche Universitäts-Buchhandlung, 1873.)]

This book belongs to that very important series of works which has been called into existence by the Historical Committee connected with the Royal Academy of Sciences at Munich. Strong motives have induced its members to undertake the publication of documents relating to German history from 1550 to 1650, chiefly taken from the correspondence of the House of Wittelsbach. It was resolved to divide the unwieldy mass of material, and to take it in hand in detail. After publication of the valuable standard works of Kluckhohn, the *Briefe Friedrichs des Frommen, Curfürsten von der Pfalz* (5 Bände, Braunschweig, 1868-72); and Ritter, *Briefe und Akten zur Geschichte des Dreissigjährigen Krieges, &c.*, Band I, "Die Gründung der Union, 1598-1608" (München, 1870), Herr von Druffel is now commencing the first section of the work.

His task is not an easy one. The mere collection of materials so widely scattered is a wearisome task, and a rare knowledge and sagacity is needed to sift them, that is, to separate what is useless from what is really important, and to exclude everything which is already accessible in print.

Herr von Druffel has executed both part of his task singularly well, and no one who has read with attention this volume of little less than 900 pages will hesitate to congratulate him on his diligence, his accuracy, and the extent of his knowledge. In his collection of materials, in which he has been assisted by Von Löher and Cornelius, he has been chiefly dependent on the contents of the Archives at Munich, with respect to which there are some very instructive remarks in the preface (p. vi.-ix.). Of German archives that of Dresden is especially valuable on account of the explanation it affords of the policy of the Elector Maurice of Saxony. The invaluable records in Vienna, consisting of the correspondence of royal personage, accounts of embassies, &c., threw new light upon the policy of the emperors, records which have been liberally thrown open to students ever since the superintendence of the records has passed into the hands of Herr von Arneth. To complete these collections we have the documents existing at Stuttgart-Cassel (Marburg), Innsbruck and Brussels, and, above all, those volumes of the Simancas archives which were taken to Paris by Napoleon I., and which still remain in the city. In Paris the editor had excellent op-

opportunities of gathering information concerning the German affairs of his period out of French documents; and he was so fortunate as to be able amply to avail himself of the despatches of the French ambassadors to the Imperial court, and those of French cardinals and ambassadors from Rome (Guise, Ferrara, Du Bellay). It was so much the more provoking that the treasures of the Vatican archives remained withheld from this as from other historical works, though something was to be gleaned from the collection of the Vettori MSS. in the State Library of Munich, and from three volumes in the Munich State Archives, consisting of instructions and reports of the Papal nuncios.

Somewhat more rigour might, perhaps, here and there have been exercised in the work of selection, though it may be hard to the learned to omit notice of any new discovery. Altogether apart from the records which this volume contains, a special value is imparted to it by the commentary with which the editor has accompanied the greater portion of it. Whether the subject treated of be the choice of a bishop at Chur, or the plundering of a cloister at Brunswick, or the explanation of the territorial circumstances of Italy, or the ramifications of French politics, the excellent elucidations of the editor never fail the reader. Only here and there do a few corrections apply to the author of the *Deutsche Geschichte im Zeitalter der Reformation*. Much more room for sharp criticism presented itself in the work of Maurenbrecher, entitled *Charles V. and the German Protestants, 1545-1555*, while additions and improvements are added to the *Briefe aus Paris* of Ranmer, and to *Der Fürstenbund und Carl V.* of Voigt, &c.

Concerning the charge made by Herr Druffel (p. 677) against an essay of mine ("Heinrich VIII. und der Schmalkaldische Bund," in *Forschungen z. Deutsch. Gesch.* x.), I will add only a few words. I had no intention of founding upon the document printed in Döllinger's *Beiträge*, &c., i. 22 et seq., and extracted by Ranke (*Englische Geschichte*, i. 203), the assertion, that at the beginning of 1540 the politics of France and the Emperor were momentarily approaching one another, with the object of combating heretics, so as to include England in the impending danger. But I may cite Ranke (*Geschichte Deutschlands im Zeitalter der Reformation*, iv. p. 126), where the words "the apostates from our holy creed" comprise Henry VIII., as well as Ranke's own words *loc. cit.*, p. 130, with which I entirely agree.

What then are the principal points illustrated by this rich collection? Herr von Druffel has done well in taking as his starting point the year 1546, which marks so important a crisis in German history. The personality of Charles V. and the preparations for the Smalkaldic war thus come into the foreground in the beginning of this volume. His circumspection towards Maurice of Saxony in the year 1546 appears conspicuously in No. 57, October 13, 1546. He will not make him an elector until he has proved his fidelity in war, and "et veoir comme ledit duc Mauris se conduyra en l'emprinsse contre le dit Saxon." The preliminaries of the

Smalkaldic war, and the military plans of the Duke William of Bavaria, who for a long time contrived to maintain a neutral position between the contending powers, occupy an important place in the story. On the Protestant side is remarkable simultaneously the trouble of bringing about a marriage between the Crown Prince of Saxony and a Princess of Ferrara, complicated with the endeavours of Prince Christopher of Württemberg to associate the Dauphin with the Smalkaldic League, of which Stälin formerly gave a short account (*Württembergische Geschichte*, vol. iv. 431). Hardly any question arising from the history of the Smalkaldic war has been so much discussed as that of the imprisonment of Philip of Hesse. We know in how much darkness this question is involved, and how often the judgments of historians have varied in imputing blame in this matter. In the present work much is said about it. Specially noteworthy is the letter of Charles to Ferdinand (No. 106, formerly printed by Buchholtz in an incomplete form), as well as Nos. 474, 657, 688. No one can doubt that the Elector Maurice at least must have plainly perceived how little security there was for the Landgrave in the words of the Emperor. The Bishop of Arras evaded every enquiry whether the Emperor would give his hand to the Landgrave after he had demanded pardon, and the fact of his causing this enquiry to be made shows what weight he attached to this formality. On the other hand, it appears to me also certain that the Emperor, while he evaded any distinct explanation as to the duration of the imprisonment, wished to avoid binding himself, and desired to lull the interceding princes into a false security by vague declarations of his gracious intentions for the future.

In the period immediately following the war of Smalkald, nothing in the present volume is of such interest as the transactions in the Diet of Augsburg, which were of equal importance in a religious and a political point of view. All the political projects which at that time stirred the mind of the Emperor were discussed, in particular the project to procure the succession to the imperial dignity for his son Philip, which led to a whole series of negotiations among the members of the Imperial house. No. 678 is especially noteworthy in this connexion, as it abounds in interesting historical and political reflections. Among religious matters, as we might have expected, the "Augsburg Interim" is conspicuous. We know what ill success attended the experiment of provisionally ordering matters connected with religion absolutely by the Emperor's authority. The Catholics did not hold themselves bound by the "Interim," and it met with much opposition among Protestants. Accounts came in from many quarters, telling how little the "Interim" was observed, and what contempt and animosity it encountered among the people (p. 229: "Quotidie novi libelli provocant contra ordinationem, quibus non minus seditio incenditur quam secta defenditur," etc.; pp. 187, 205, 708, 734, &c.). At the same time the complaints of Spanish pride, haughtiness and outrages increased (p. 477). Above all, the stand made by the town of

Magdeburg against the Emperor, the progress of the siege of this "citadel of God," and the military and still more weighty political consequences which this event entailed, are heard of again and again almost from one end of the volume to the other. But simultaneously the great questions of foreign policy exerted their influence. The relaxation of the bond between the Emperor and Pope Paul III. comes out with constantly increasing clearness. It was caused by the efforts of the Pope to extend his domestic power in Italy, and to remove the Council from Trent to Bologna. The intrigues of French policy, and especially the history of the conclave which was opened after the death of Paul III., as well as the election and beginning of the reign of Julius III., are clearly discernible in the records themselves. And while we linger for a moment over the history of the conflict between the Pope and the Farnesi, who were protected by France, our attention is at once arrested by the re-opening of the Council at Trent, of which many accounts are communicated. One of the weightiest questions was how Maurice would comport himself towards the Council. Maurice meanwhile tried to gain time, and took as a pretext the question of the "safe conduct." Even on this ground—as Druffel (p. 844) shows, in opposition to Ranke—he was able to prevent the theologians of Saxony, Württemberg, and Strassburg from composing a universal confession of faith such as they might have offered to the Council.

For Maurice had already so far prospered in the secret planning of his ambitious schemes, that the moment of breaking with the Emperor and laying aside the mask drew near. The newly-disclosed records enable us to gain a deeper insight into the perplexed game of political intrigues of those days, which Cornelius has lately endeavoured to sketch in several valuable works, confirmed by the documents which are printed here *in extenso*. Presently the charge of carrying out the ban against Magdeburg gave Maurice the best opportunity of bringing about a decisive struggle, and at the same time of keeping the Emperor in the delusion that he might continue to reckon on his fidelity. Vain were the warnings which came to the Emperor from the Queen Maria, from his brother Ferdinand, from the faithful Lazarus Schwendi, who anxiously tracked the steps of Maurice (Nos. 643, 801, etc.). He persisted in his incredible blindness, and, notwithstanding the advice of Granvella, who had at last become suspicious, went to Innsbruck, where ruin overtook him. Meanwhile Maurice, while he went to work on all sides with diplomatic cunning, had leagued himself with the German princes, among whom an alliance against Charles V. already existed, and at the same time further advanced his negotiations with France. ALFRED STERN.

The Maid of Killeena and other Stories. By William Black. (London: Macmillan & Co., 1874.)

It is doubtful whether there be at the present time any greater proof of courage and self-denial than the writing of a good novel.

For, in the first place, any person who commits this deed must be well aware that, as a rule, the people who are able to appreciate his work will not read it, and that the people who do read it will not be at all grateful to him for his trouble, being usually incapable of discerning good work from bad. And, in the second place, the chance which even a good novel has of living, of being read more than once, and, in short, of taking rank as literature, and not journey-work, is infinitesimally small. The mass of published novels is so enormous, and the axiom that novels are to be read and thrown aside is so generally accepted, that even really good and distinguished works are apt to be swamped in the torrent of contemporary trash, without reaching their natural home, the bookshelves of persons who really read. A poet or an historian will probably not be read, but he will be remembered; the novelist has the much more ignoble and unsatisfactory fate of being probably read and certainly forgotten.

Nevertheless there are still people here and there (a faithful, or it may be foolish, few, among whom we are content to rank ourselves), who think of the novel as of a possible and legitimate form of literature, and who are grateful to the rare artist who, now and then, has intelligence and self-respect enough to take the same view of his profession. It is unnecessary to say that Mr. Black is such an artist, and that he is probably the most considerable of the class now living and writing. If we were asked to specify his merits, we should say that he has, of all novel writers of the present day, the clearest and justest conception of what a novel should be, and that his hand is surer than that of any other writer in combining the four constituent elements of plot, character, description, and dialogue. Many novelists of great special power ruin the general effect of their work by giving that power too much rein, and Mr. Black himself has been charged, we think unjustly, with committing this fault in regard to description. But in other points he is singularly irreproachable. He has, we perceive with thankful gladness, no moral purpose whatever; indeed, we should doubt his having any principles at all. He never shoots sententious generalities at us in the manner of some writers, whose works one feels inclined to print with blank spaces, filled in with "Here applaud," or "This is a fine thing," in italics. He does not mistake a novel for a sermon, or a piece of polemic, or a drama, or a poem. And if it be true that he has never yet produced what can properly be called a masterpiece, it is equally true that there is no one from whom a masterpiece, some time or other, can be so confidently expected.

The present volume, however, does not contain—and indeed has no pretensions to contain—any such masterpiece, though it illustrates very well the merits we have mentioned. It is simply a collection of studies and sketches, generally graceful, but always slight. Of these sketches, "A Fight for a Wife" is amusing and pleasantly written, but rather burlesque, and even improbably burlesque. "Queen Tita's Wager" has not this drawback, and is very perfect in its quiet kind. But the "True Legend of a Billiard Club" is very much the

best of the three, and could scarcely have been better. Perhaps the only fault to be found with these is the echo not only of the manner, but also of the mannerisms, of Thackeray. Mr. Black could hardly have chosen a better model, but he might have imitated more wisely. "This young person," "this small and gentle creature," and so forth, are dangerous phrases if used too freely, and even from the master we had them, if it were possible, a little too often. *The Strange Adventures of a Phaeton* were not improved by this sort of thing, and it would be a great pity if the mannerism became stereotyped.

But the *Maid of Killeena* is quite Mr. Black's own. The hero is something like the hero of the finest of the tales in the *Earthly Paradise*—

"A loiterer in the spring-tide sun,
A do-nought by the fireside
From end to end of winter-tide,
And wont in summer heats to go
About the garden to and fro,
Plucking the flowers from bough and stalk,
And muttering oft amid his walk
Old rhymes that few men understood."

Being as he is a Hebridean Scot, the natural end of this sort of thing is that he should be sent by his good-natured, if less gifted brethren to Glasgow, that so he may obtain the position of dominie. The attainment of this eminence, the consequent success of his love for the Maid of Killeena, and what thereafter befell, Mr. Black has drawn as few but he can draw. There is very little, hardly any, parade of scenery, but the surroundings are indicated with excellent skill, and Ailasa Macdonald, the heroine, is at least as charming as Mr. Black's heroines always are, perhaps more charming than any of them since Coquette. In short, the stories are, with hardly an exception, very excellent *parerga* for a man of genius. Let us hope that Mr. Black will give us the *ergon* at his next appearance.

GEORGE SAINTSBURY.

MINOR HISTORICAL BOOKS.

King and Commonwealth: A History of the Great Rebellion, by B. Meriton Cordery and J. Surtees Phillpotts (Seeley, Jackson, & Halliday), is a useful and readable account of the period from the calling of the Long Parliament to the Restoration of Charles II., with preliminary chapters on the preceding history of the times of the first two Stuart kings. The view taken of political questions is in the main that taken by Mr. Forster, and those who think that Mr. Forster's views must be subjected to considerable modifications can hardly expect to see those modifications as yet adopted in a book prepared for popular or scholastic use. Though the references given are often too vague, the accessible materials appear to have been diligently consulted, and the maps of the battle-fields considerably enhance the value of the book. Mr. Phillpotts states that he hopes that allowance may be made for errors, on the ground that "the fact that the Stuart period has been set for the Oxford and Cambridge certificate examinations of this year, has made it necessary to print off the book for immediate use." Those who are preparing for these examinations may be fairly congratulated on the assistance thus offered to them. But it may be pointed out for their benefit that the omission to state in the account given of the New Impositions at p. 15, that the original duty on currants had been imposed by Elizabeth without consent of Parliament, throws the *onus* of the

charge of illegality unduly on James, an unfairness which is increased by the subsequent omission to state that his action was sustained by the Court of Exchequer. Further on we have in a note to p. 30 an ingenious explanation of the difficulty of the light incidence of a subsidy which was nominally an income tax of four shillings in the pound. The subsidy, say the authors, was levied, not on a valuation made in the reign of Charles I., but on a valuation made in the reign of Edward III. Are they not thinking of fifteenths? For their explanation seems to be overthrown by the clause in the Subsidy Acts which directs the Commissioners to "enquire of the value of the substance after the usual manner . . . without respect of any former taxation."

The key to Charles's later constitutional position is to be found in a better understanding of the events of the session of 1629 than the writers of this book can be expected to arrive at. But there is one document not even mentioned in their work which is indispensable to a fair historical conception of these events. Let them open the Book of Common Prayer and, reading the Declaration prefixed to the Articles, remember that it contains the policy, as opposed to the Commons' policy of pure suppression of unpopular opinion, upon which Charles met his Parliament. It is easy to find objections to the policy thus shadowed forth, but it at least should have enabled the authors to understand, better than they seem to have done (p. 387), how it was that Wentworth came to throw himself unreservedly on the King's side; though even this would perhaps be of little avail until the old, and, it must be acknowledged, universally believed absurdities about the Petition of Right being treated as a dead letter in the spring of 1629, are satisfactorily exploded.

MR. A. OUTBILL's pamphlet, *Petition of Right: an Inquiry into its History and Nature*, is an historical investigation into the modes in which the subject obtained redress under the Plantagenet Kings, when wronged by the Sovereign or his ministers. Holding it to be advisable that the State of the present day should be liable to a greater extent than is now the case to make recompense for damages done to individuals, he argues that to proceed in this course would be in accordance with the spirit of the earlier law. For the greater part of the reign of Henry III., he contends, the King was liable to be summoned to submit his case to his own courts, the practice of approaching him by a petition of right being introduced either by Edward I., or by his father at the close of his reign when he was acting under Edward's influence. But even then "the word *petitio* did not mean, and was not understood by the ancient lawyers to mean, a *prayer*." It was rather a demand that right might be done to which the King was bound—*quasi a lege compulsus*, according to Bracton—to listen, and to do justice to the person wronged.

The Life of Otto von Guericke (Magdeburg: Baensch), the inventor of the air-pump, written by the late Herr Hoffmann, has been edited by Dr. J. O. Opel. As a citizen of Magdeburg who took a leading part in the politics of the place from the days preceding the sack by Tilly's army to the days when the city was incorporated with the dominions of the Elector of Brandenburg, Guericke lived to take part both in the events which led to the dissolution of the political union of his fatherland, and in that union with the House of Brandenburg which was afterwards to lay the foundation of the modern unity of Germany.

THE author of *The House of Stuart* (Society for Promoting Christian Knowledge) resembles those artists who try to paint before they learn to draw. He contrives to make himself interesting enough to satisfy the young people for whom the book is intended. But a writer who thinks that James I. sent volunteers to Holland "to assist Prince Maurice, the son of the Elector and a

Elizabeth of England," and that these "were speedily followed by 12,000 more commanded by Lord Mansfield," must excuse us for expressing an opinion that his book is likely to be more amusing than instructive.

DR. A. FOURNIER, in his *Abt Johann von Viktring* (Berlin), has instituted a searching enquiry into the text and historical authority of the *Liber Certarum Historiarum*, a book of considerable authority for Austrian and Carinthian history in the end of the thirteenth and the beginning of the fourteenth centuries.

DR. LEONARD SCHMITZ's *History of Greece* for Junior Classes, in Collins' School Series (Collins, 1875), gives little boys the whole history, from the mythical period to the accession of the present king, in 193 small pages. The work of compression is effected by the abandonment of any attempt to interest the youthful reader. If boys can be induced to study it, they will doubtless know a good deal about the skeleton of Greek history. But we suspect that if Dr. Schmitz attempts to bring them up to their work, he will have to use the means which Xerxes employed to induce his Asiatics to fight the Spartans at Thermopylae. Another book of the same series, Mr. Dawe's *Landmarks of General History in the Christian Era*, attempts a still more difficult task. But the result is hardly sufficiently satisfactory to give the writer a claim to challenge the possession of a field which has recently been occupied by Mr. Freeman's *General Sketch of European History*.

Alfred Dove, *die Doppelchronik von Reggio und die Quellen Salimbene's*. 8vo. (Leipzig.) Of all the Italian chroniclers of the thirteenth century, Fra Salimbene de Adamo, a citizen of Parma, who in 1238 entered the Franciscan or Minorite order, and lived at Reggio after 1281, is perhaps the most important, and certainly the most interesting. His chronicle, which bears throughout a subjective character, and of which so much as has been preserved relates to the years 1167-1287, is important not only on account of the facts which it recounts, but still more from the peculiar manner in which the author relates them. Possessed of a rich experience of the world and knowledge of mankind, and casting his eyes freely upon the manifold phenomena of life—we have, for example, no better source of information for the fashions and costumes of the thirteenth century—this monk, in his quiet cloister, follows with a lively interest and a quick understanding the changes and chances of that important historical drama which has been enacted during his lifetime, and accompanies his account of them with most valuable expressions of opinion, which allow us to see clearly into the spirit of the writer, and of the order to which he belongs.

Important as Salimbene's work is, nothing has hitherto been done for its critical elucidation; nor have we hitherto had any satisfactory information on the relation between Salimbene's work and the other chronicles of Reggio. This investigation has at last been made by Herr Dove, and a satisfactory solution of most of the existing difficulties has been arrived at, although there may still remain some doubts on points of minor consequence. His work is one of the greatest interest and merit. At its close he intimates the possibility that he may proceed to a critical edition of Salimbene, of which there is great need, after the defective edition of the *Parmesan Affó*. So it is to be hoped that the learned and clear-sighted author of the present work will keep his promise as soon as possible.

Beiträge zur Geschichte der Kreuzzüge. Von Reinhold Röhricht. 1. Band. (Berlin.) Dr. Röhricht's book, which we announced some time ago in these pages, has now appeared. The first volume is divided into three different parts. The first part contains a revised and improved edition of a treatise formerly published by Dr. Röhricht, on the Crusade during the reign of Frederick II., in 1228; the second gives an ac-

count of the battles between Saladin and the Christians in 1187 and 1188. In both is to be recognised a diligent and careful study of the Arabian sources of information, which in the earlier accounts of these battles were not sufficiently made use of. The third part is particularly important for students of the Oriental languages. It contains the fragments of a translation of the work of Kamal-ad-dén, *Die Sahne der Geschichte Halebs*, "The Cream of the History of Haleb," which until now have remained unprinted. The translation is said to have been done by Silvestre de Sacy, the greatest Oriental scholar of France, and indeed of his time. It is to be found in manuscript in the library at Berlin. De Sacy's extracts from the work extend from the year 1095 to 1174, and are of the greatest value for the history of the Crusades during that period, and therefore we are assured that everyone will feel that all thanks are due to Dr. Röhricht for opening up such a source of information to us.

EDITOR.

NOTES AND NEWS.

MR. ROBERT BROWNING's new poem, entitled *Aristophanes' Apology*, is now in the printer's hands, and will very soon be issued by his publishers, Smith, Elder and Co.

Under the title of *The Royal North Gloucester*, Mr. W. J. Crippe, a captain in that regiment of the Militia, has just published an account of the regiment from the date of its formation down to the year 1872. In the introductory chapters some interesting notes are given on the early history of the establishment of the English Militia derived from the public records and other authentic sources; beside these notes, Mr. Crippe's remarks on the relation of the Militia to the regular army, as contained in the concluding chapter, make an otherwise local subject of interest to the general reader. Two curious woodcuts from the British Museum Library, representing Militia-men in the time of George II., are added as illustrations.

We understand that Mr. J. A. Symonds is engaged in printing the first part of a book to be called *The Renaissance in Italy*, and that this volume will shortly be published by Messrs. Smith and Elder. His object is to set forth some conditions, social and political, of the Italian states in the fourteenth and fifteenth centuries. This section of the work will in course of time be followed by a review of Italian art, scholarship, and literature during the Renaissance.

The second volume of Mr. Macleod's *Principles of Economical Philosophy* will be published next week.

BESIDE the primers of literature and history in Mr. J. R. Green's series that we mentioned last week, there is to be a primer of Greek literature by R. C. Jebb.

THE Palaeographical Society has decided on issuing an Extra Series, consisting of facsimiles from Oriental MSS., the terms of subscription to be half-a-guinea for members of the society and fifteen shillings for non-members. Professor W. Wright, of Cambridge, has consented to undertake the selection of the specimens, and to superintend the printing of the plates; and as soon as one hundred names of subscribers have been secured the preparation of the first part will be proceeded with. The series is intended to include Hebrew, Samaritan, Syriac, Mandaitic, Aethiopic, Arabic, Persian, Armenian, Zend, and Sanskrit MSS.; and perhaps, ultimately, for the sake of greater completeness, Phœnician, Himyaritic, and Indian inscriptions. Subscribers' names will be received by Mr. E. Maunde Thompson, British Museum.

THE *Clio* of December 21 (Old Style) contains a Greek translation by J. N. Valetta of Professor Max Müller's article on *Wolf-Children*, published in the *ACADEMY* for November 7, 1874. Like all that M. Valetta writes—for instance, his translation of

Otfried Müller's *History of Greek Literature*—this translation is written in a Greek entirely free from modern corruptions, and, but for certain constructions, not unworthy of Plutarch.

PROFESSOR SCHRADER, of Jena, the well-known German Assyriologist, has been elected member of the Royal Society of Sciences of Saxony.

ON the 8th of November last the British Minister was received by the Shah for the purpose of delivering a letter of the Prince of Wales, in which His Royal Highness expresses his thanks, and the great delight he felt at receiving it, for the present of the Shah's *Diary* of his journey to Europe. The *Gazette* says that His Royal Highness writes in his letter "that English translators have translated the book into English." Another paragraph in this *Gazette* (it is of November 18 last) mentions that the French Minister had an audience and presented to the Shah the thanks of Marshal MacMahon for the *Diary*, which the Shah had sent as a souvenir. For some time past the last article of the *Gazette* has always been a chapter or so of the wonderful adventures of "the Swiss Robinson," translated from the French by the editor of the paper, the Saniä-ud-dowleh.

IN our last number (p. 53 col. b) a misprint occurred in reference to the "Foreign Enlistment Act" of 1819, for which 1820 was accidentally printed.

THE following Parliamentary papers have lately been published:—Appendix to Reports on Vienna Exhibition, Maps and Plans (price 6s.); South Australia: Report of Commission on Intestacy, Real Property and Testamentary Causes Acts (price 1s. 10d.); Report of H.M. Consul-General in Siam (price 1d.); Commercial Reports of H.M. Consuls in Japan, 1873 (price 8d.); Statistical Abstract relating to British India, from 1864 to 1873 (price 5d.), &c.

THE German papers announce that the distinguished African explorer, Dr. Georg Schweinfurth, has been appointed by the Khedive General Director of all the large collections, museums, and other scientific institutions of Cairo. He is to leave Berlin in February to enter upon his new duties in the Egyptian capital, where another eminent German, Professor Brugsch of Heidelberg, has for more than two years occupied the honourable position of State Historiographer to the Viceroy.

THE *Rivista Europea* for this month notices the discovery of some interesting papers in the criminal archives at Rome, lately opened up by the Italian government. Among others there is an inventory of the personal possessions of Michel Angelo at his death, containing a list of his unfinished statues and cartoons. It is hoped that the publication of this will be a feature in the approaching centenary of Michel Angelo. There are also mentioned as discovered the process, against the Caraffas and the enquiry into the poisoning of Cardinal Ippolito de Medici. These records were found in great disorder, many of them lying on the pavement and almost ruined by the damp. This neglect has probably saved them from being made away with by the Papal Government.

IN the same journal Signor Attilio Hortis, by a new reading of a passage in Petrarch, clears him from the imputation of jealousy towards Dante, and a desire to depreciate his character. Petrarch (*Rerum Memorandarum* lib. ii. cap. 3) is the authority for the story about Dante's surliness at the court of Can Grande. The passage as printed in all the editions of Petrarch runs: "Dantes . . . vir vulgari eloquio clarissimus fuit, sed moribus parum per contumaciam, et oratione liberior quam delicatis ac studiosis aetatis nostrae principum auribus atque oculis acceptum foret." From an examination of the MSS. in the Laurentian Library at Florence, especially of one which is supposed to be by the hand of Candido Decembrio, Signor Hortis establishes the true reading of the words italicised to be, "sed moribus parumper contumacior," and also "fastidiosus" for "studiosus." In this way the passage is a reflection on

Can Grande rather than on Dante. Signor Hortis also publishes for the first time a Latin poem in honour of Dante attributed to Petrarca, existing in the Archivio di Stato at Florence.

FROM Trübner's *Oriental Literary Record* we take the following items: Mr. Robert B. Shaw, Her Majesty's Resident at Kashghar, is printing, under the sanction of the Indian Government, a sketch of the grammar of Eastern Turki as spoken in Kashghar and Yarkand, together with a vocabulary containing about three thousand words and some prose examples, being extracts from an old Turki book, obtained from one of the Mussulman shrines near Kashghar. This book professes to give the history of the introduction of Islam into Kashgharia in the tenth century of our era, and of the lives and wars of the early Muhammadan kings of that country before the time of Changiz-Khan.

MR. BURNELL has been engaged on a large manual of South Indian Palaeography. Fourteen plates are finished, and the book will be completed in 1875. It will be a quarto with about one hundred pages of text, and twenty illustrations.

A *Dictionnaire et Grammaire de la Langue Cris*, par le Rév. Père Albert Lacombe, has been published at Montreal.

MESSRS. TRÜBNER AND Co. will shortly publish *The Romantic History of Sakya Buddha*, translated from the Sanskrit into Chinese by Dīnanakuta (A.D. 600), and from the Chinese into English by the Rev. Samuel Beal. The same firm has in the press *A Practical Handbook of the Uriya or Odiya Language*, by T. J. Maltby, of the Madras Civil Service. They also announce, as in preparation, *The Geographical Dictionary of Abu Obeid El-Bekri*, the text carefully collated with the Leyden, Cambridge, Milan, and British Museum codices, and edited by F. Wüstenfeld, Professor of Arabic at the University of Göttingen; *The Poems of Hafiz of Shiraz*, translated from the Persian by Herman Bicknell, and illustrated by J. R. Herbert, R.A.; and a second edition, revised and enlarged, of Dr. Caldwell's *Comparative Grammar of Dravidian or South Indian Family of Languages*.

D. FRANCISCO DE CÁRDENAS contributes to the *Revista de España* some papers on the ancient Spanish taxes considered as the result of territorial lordship. The details respecting the *diezmo* or tithe show that in its origin it was purely civil, paid directly to the lord of the soil as rent, to the Caliph as tribute, and afterwards to the king or Christian chief. The churches were not originally supported by a taxed tenth of the substance of the faithful, but by voluntary offerings. The plan does not seem to have worked badly, as we are told that the second council of Braga condemned the custom of speculative church-building, in which religion was farmed by persons who built the fabrics, paid the clergy, and pocketed the proceeds of the offerings.

DR. KARL GOEDEKE, of Göttingen, has been discussing in a recent number of the *Allgemeine Zeitung* the long mooted question whether Shakespeare's Sonnets were addressed to a man or a woman. He regards the hypothesis of their having been written to Lord Southampton as utterly untenable, and attempts to show that probability and almost every consideration that can be brought to bear on the question, favour the assumption that Anne Hathaway, the much maligned wife of the poet, is the "friend and love" to whom he has addressed his impassioned verses.

THE Christiania correspondent of the same journal states that a sealed packet had been deposited some years ago in the Norwegian State Archives by the late Professor P. A. Munch, with directions that it was not to be opened till after the death of Father Theiner, the German librarian of the Vatican, lest the publication of the documents which it enclosed should bring upon that great scholar the displeasure of the Papal Govern-

ment, in whose service he was. It is rumoured that this packet contains a report of numerous highly interesting historical and literary treasures in the Vatican Library, which the Norwegian professor had been enabled by the permission of Father Theiner to examine and describe. It is proposed at the next meeting of the Storthing to ask for a grant to defray the cost of publishing these documents, together with the collected works of Professor P. A. Munch, which, in accordance with a previous resolution of the Chambers, are to be printed at the expense of the State, under the editorship of Dr. Storm.

SINCE the appearance of our note on the centenary of the art of printing which was lately celebrated at Valencia, our attention has been directed to a notice, which was contained in a recent number of the *Allgemeine Zeitung*, of the contest going on at present between Valencia and Barcelona for the honour of having possessed the first printing-press ever used in Spain. It would appear from this report that a sharp paper war has been raging, since the month of June, 1874, between Don Jose Maria Torres, Head Librarian at the Library of Valencia, and Don Antonio Boraful, the former defending the claims of his native city in the *Bolentin-Revista del Ateneo de Valencia*, and the latter trying to establish the pretensions of the more northern University city in the *Revista Historico-latina*. Whatever may be the real merits of the case, it seems certain that printed books were completed at very nearly the same date in both cities; and that the presses in use were under the direction of Germans, to whom the Spaniards were indebted for their earliest specimens of printing. The *Trobes en Lahor de la Verge Maria* (Valencia, 1474), to which we referred in last week's ACADEMY, does not give the name of the printer, but it is admitted by Spanish scholars that there is every probability for assuming that this curious little work was printed by a German, Lambert Palmart, whose name, with that of a Castilian coadjutor, Alfonso Fernandez de Cordoba, appears on the title-page of a Valencian translation of the Bible, which was being printed between the spring of 1477 and that of 1478. From that time till the beginning of the sixteenth century a long list of Germans is to be found among the printers of Valencia. As far as has been as yet definitely proved, the earliest book printed at Barcelona appeared in 1475, and bears the name of a German printer, "Spindeler," probably the same person as the "Squindeler" who printed other early Spanish books. In 1475 a printing press was opened at Saragossa by a native of Flanders, who is referred to as "Master Matthäus," by Father Mendez in his *Tipografia Española*, which was re-edited and enlarged by Dionisio Hidalgo in 1861 (Madrid).

THE *Journal Général de l'Imprimerie et de la Librairie* gives some details of the additions made to the National Library in 1874. Among the MSS. are the autograph copy of the translation of Martial by the Marquis de Vilette; a collection of charts and documents relating to Champagne and Brittany, from the twelfth century; a *Nobiliaire d'Auvergne*, drawn up in 1086; the copy of an Arabic MS. containing the *Septennarii* of Hippocrates with Galen's Commentaries; a copy of the catalogue of the chief library of Tunis; a collection of charters of the Seigneurs de Mayenne; a collection of original letters of Huet; a fragment of a moral treatise in French of the fifteenth century; fragments of an early copy of Marco Polo; and about 900 verses of Mainet, a *chanson de geste*, of which no MS. was believed to exist, and which is known only by an imitation in German verse of the thirteenth century. Mr. Ormsby Gore has allowed a copy to be made of his collection of letters of the twelfth to the fourteenth century, bearing the name of Richard of Bury, which contains information bearing on the history of Guyenne in the thirteenth and fourteenth centuries. Among additions to the department of Engravings are

two volumes of photographs of pen and ink drawings by M. Buisson of members of the National Assembly, published under the title of *Monuments Souverains*; while the department of Proofs has been enriched with proofs before letters of engravings by MM. Henriquel, Danquin, Gaillard, Patunty, de Rochebrune, Maxime Lalanne and Leg

ROBERT CLARKE AND Co., Cincinnati, Ohio, who are the authorised publishers of the U.S. State Reports, have notified that they will give the public a series of reprints of legal cases. Of this series, three have already been issued: Montesquieu's *Spirit of Laws*, including the memoir and analysis by D'Alembert; *The Doctor and Student*, by St. Germain; and the *De Legibus Legum Anglica*, by Fortescue. Nothing has been attempted than to present a faithful reprint of the best editions of these authors, so that the editorial labour required for their production must have been small, but the publishers have done their part in a most satisfactory manner. The price of each volume is three dollars. We may add that of Fortescue's celebrated treatise, so often quoted from and seldom read, no edition has appeared in England since that of Ames in 1825, of which this is a republication, so far as the translation and notes are concerned; and that it sadly needs re-editing from the standpoint of our present knowledge.

IN the *Edinburgh Review*, Mill's *Essay on Religion* are reviewed by the ghost of Some Jeremy, rather more modest but as shallow as ever. There is a very learned article on Lusio Pilaris and Lawn Tennis; the latter game, in the judgment of the reviewer, is too much based upon racket. The article on Leonardo da Vinci is chiefly remarkable for the stress laid on the side of his nature which it would be easy to call servility. There is an uncritical article on Mr. Cox's application to Greek History of an uncritical amalgam of Cornwall Lewis and Max Müller. A very unauthorised reviewer of the *Life of the Prince Consort* maintains that Sir Henry Bulwer's wish to carry through the Coburg scheme, to which his own Court and Government were indifferent, if not hostile, was the occasion of the breach of faith on the part of the French Government.

WE have received *The Elements of Geometry in Eight Books*, Part I., by L. J. V. Gerol (Longmans); *Church and State*; or, *Christian Liberty*, by A. Welby Pugin (Longmans); *The Papal Encyclical and Syllabus*, literally translated, reprinted from the *Daily News* (Bradbury, Agnew & Co.); Goethe's *Hermann and Dorothea*, trans. M. J. Teesdale, second edition (F. Norquist); *Cenni sull'Agricoltura della Sardegna* (Cagliari: tip. Timon); *The Dramatic Works of William Shakespeare*, with Biographical Introduction by H. Glassford Bell, Vol. I. (Collins).

THE subjoined letter from Sir Charles Lytton to Lord Hatton will serve to illustrate what some have termed the overdrawn description by Macaulay of the results of Monmouth's rebellion:

"at Taunton October 28. 18."

"My Lord,
I thought it unreasonable to divert you from y^e enjoyn^{mt} of a new married bed, w^{ch} y^e estate of this place, w^{ch} have bene nothing but complaints of y^e violence of our predecessors to y^e country in all kinds, both as to the persons as well as goods, such as I have scarce known practised at any time in our former civil warrs & w^{ch} I cannot but believe we shall heare more of when y^e Parliament meets, and of the execution of so many of y^e traitors heere. Is it one lump and all q^{tered}, and more every day in other parts of y^e countrey, w^{ch} will be to y^e number of near 800, and most of they^r q^{ters} are and will be set up in y^e townes and highways so y^t y^e countrey lookes as if one passes already like a shambles. You may think what it will be when all is done. Those who suffered heere were so far from deserv^{ing} any pity, at least most of 'em and those of y^e best fashion (unless they speake more charitably it be most greivous) that they shewd no shew of repentance as if they died in as ill cause, but iustified they^r Treason & gloried in it."

Here is another bit from the same correspondence:—

"June 11 88 London.

"Yesterday 5 minutes before 10 in y^e morning the Queen was delivered of y^e Prince of Wales. I come now from seeing him as he was undressing & he is a delicate fine boy, very well complexioned and looks healthy and sprightly. He is to have no wet nurse."

THE current number of *Vanity Fair* (Jan. 23) contains an article from a French correspondent entitled "Le Salon de la Princesse Mathilde," which supplies a good deal of intimate information with regard to contemporary literary and artistic characters, including Renan, Sainte-Beuve, Victorien Sardou, &c.

NOTES OF TRAVEL.

CAPTAIN ELTON, with Navigating Sub-Lieutenant Pullen, of the *Shearwater*, explored and surveyed the delta of the Rufiji a year ago, and their narrative was read at the meeting of the Geographical Society on Monday week. These officers took soundings across the main stream of the river above the delta. This was a year before Mr. Stanley's recent excursion to the Rufiji delta; and Mr. Stanley did not go nearly so far up the river as Captain Elton, or as Dr. Kirk did some years previously. Mr. Stanley thinks that the Rufiji is a great navigable river, the trade of which might be wonderfully developed. Captain Elton, on the contrary, basing his opinion on soundings carefully taken and information collected, found that the Rufiji, like most African rivers, was a delusion and a snare; that, though there were no rapids, sandbanks were numerous; and that there was not more than four or five feet of water in the channel. Mr. Stanley made a similar mistake in the case of the Wami river, which he reported to be navigable for several hundred miles, and considered it to be the future means of water communication with Central Africa. A subsequent surveying expedition from H.M.S. *Briton* succeeded in getting twenty-three miles up the Wami, at which point the whale boat grounded, the pinnace not getting so far. At low water the mouth of the Wami may be easily forded, and is scarcely ankle deep. These instances show the necessity for surveys by experienced officers before any conclusions can be formed as to the navigability or otherwise of African rivers.

THE thirty-fifth meeting of the Verein für die Deutsche Nordpolarfahrt, which took place at Bremen on December 27 last, was convened for maturing a plan for a new German Arctic Expedition. If the necessary funds can be collected it is intended that the expedition shall sail in June, 1875; if not, in June, 1876. The expedition is to consist of two steamers of about 300 tons burden, with crews of from twenty-five to thirty men. Both will carry scientific men. To the officers and crew of one vessel will be entrusted the exploration of the deep fiords on the east coast, running into the interior of Greenland. The other steamer is to push northwards along the east coast in the direction of the Pole; and to send out sledge parties, in the same direction, from the furthest point reached by the ship. The expedition will be provisioned for three years. It will be necessary either to buy or to build the steamers, as there are none suitable for the service in the Imperial navy. The cost of building, including engines, is estimated at 150,000 thalers. The provisioning, stores, and instruments will bring the whole outlay up to 300,000 thalers. It is considered that the departure of the German expedition in June, 1875, is a matter of great importance, because in that month the English Arctic Expedition will sail for Smith Sound and the western coast of Greenland, and the two might co-operate in the scheme of observations, as well as in the discovery of the northern side of Greenland. The Bremen Society will submit this scheme to the German Geographical

Societies and other learned bodies, so that all well-wishers of German polar discovery may use their best endeavours to further the good cause. We heartily wish them success.

Two important Russian works of travel are now passing through the press. The first contains the results of the late M. Fedchenko's explorations in Kokand and on the Alai plateau, and is a work of the very first importance to all students of the geography of Central Asia. It is being edited by M^{me}. Fedchenko, and will be illustrated by her sketches, and by a map. The second is a narrative of three years' travel in Mongolia and the Tongout country, by Colonel Prshewalsky. The second and third volumes of this work will be devoted to meteorology, zoology, and botany. The first volume contains the narrative of Colonel Prshewalsky's travels. This officer penetrated in the direction of Tibet as far as Lake Kokonor, of which he gives a full description. The importance of both these works, not only to geographical students, but also to Indian statesmen, can scarcely be over-estimated. Efforts have been made to publish them both in English, and it is a lamentable sign of the want of insight, as well as of enterprise among English publishers, that it has not been found possible to make an arrangement with any of them for the simultaneous publication, in St. Petersburg and London, of works of such great value.

CAPTAIN NARES arrived in England, from Hong Kong, on Saturday the 16th, having left the *Challenger* on December 10. He has since been busily occupied at the Admiralty with the arrangements for the Arctic Expedition. On the 16th, also, Commander Markham returned from Dundee, after having engaged six ice quarter-masters from among the best whaling seamen of Dundee and Peterhead, three from each port. It has been arranged that Commander Markham shall be in the advanced ship with Captain Nares; and Captain Seymour will be appointed to the second ship. The appointments of several other officers to the Arctic Expedition were made on Wednesday last, including Lieutenants Aldrich, Gifford, Parr, May, and Rawson, two Assistant Paymasters in charge, and four engineers.

COLONEL GORDON has discovered the real character of Abou Saoud, the slave-dealing ruffian against whom he was warned by Sir Samuel Baker, but who was nevertheless engaged for the expedition. It is fortunate that Colonel Gordon has got rid of this rascal, and it is to be regretted that he should ever have employed him. It will be remembered that certain correspondents of the *Times*, both in England and Egypt, thought proper to doubt Sir Samuel Baker's estimate of Abou Saoud's character, and insinuated that he had acted harshly towards this arch slave-hunter, and that Colonel Gordon's tact and judgment would show the man in a different light. The result shows that Sir Samuel Baker was quite right.

COLONEL GORDON, in his communication to Mtesa through Colonel Long, last July, requested that powerful chief to give every help to Lieutenant Cameron; and Rumanika has been addressed to the same effect, in the event of the young naval officer making his way northwards. Colonel Gordon now has an outpost ten to fifteen days' journey from Mtesa's capital, and has discovered, through Colonel Long's journey, that the river is navigable from this outpost to Urondogani, within three days' journey of Mtesa's.

THE Russian Government has decided upon the canalisation of the Niemen, which, when completed, will prove an important benefit to the navigation of that river. All the newest appliances of science by means of electro-magnetic and other forces are to be put into operation for the blasting of the numerous sunken rocks, and the removal of the embedded trunks of trees, which have hitherto proved so disastrous to shipping, and to the successful transmission of the wood floated down the stream.

CONSUL BARROW reports from Kertch that there is perhaps no country in all Europe where a wider field is open to speculative capitalists and agriculturists. The almost virgin soil there needs only to be broken by as rude a plough as may well be found. The depth of it round Kertch is considerable; and if the whole country assumes the aspect of a vast uncultivated wilderness, it is solely owing to the wide extent of land compared with the thin and sparse population spread over its surface. "Those," adds Mr. Barrow, "who are dissatisfied with the labour wages at home would do well to make themselves acquainted with the capabilities of the Crimea. . . . I am persuaded that steady, hard-working husbandmen—Scotch more particularly—would meet with every encouragement and kindness from the Russian Government, and would soon convert a howling wilderness into a garden of Eden." Cattle of a small ordinary kind may be had in any quantity from the Caucasus.

WE learn from an official report recently received from Constantinople that the popular belief that the mohair goat is indigenous to the Angora and adjacent districts has of late been exploded. During the past six years thousands have been exported to the United States, to the Cape of Good Hope, and to Australia, where especially they seem to thrive. It is a singular fact that in its native country the Angora goat drops yearly but one kid, two kids being a great exception. At the Cape and in Australia twins are the rule; and, moreover, these goats breed twice a year. From these circumstances, and from the greater care exercised by our own farmers, especially in rearing, we may expect in a few years' time to see a larger production of mohair in British colonies than in Turkey itself.

A few interesting facts about the little-known island of St. Thomas, Danish Antilles, are given in a recently printed report from our consul there. The climate is warm, yet temperate, and varies little all the year round, the thermometer seldom falling below 70°, or rising above 90° Fahrenheit. Cyclones visit the island on an average about once in twenty years; the ravage they then cause is immense. Slight shocks of earthquake, accompanied by subterranean noises, are of almost fortnightly occurrence, and do no harm. The only town, or even village, was originally christened Charlotte Amalia, but is now generally known as St. Thomas. Its inhabitants number from 11,000 to 12,000, of whom about 1,200 are pure white. The Danish officials and military are said far to exceed the requirement, and are all highly paid out of the local revenue. Mercantile enterprise is left entirely in the hands of other Europeans. The chief advantage of the island lies in its being the most convenient West Indian port of call for vessels bound on the long and often tempestuous routes between Europe and Mexico, the United States, and the Brazils. Among the town amusements are a public library and reading-room, and a small theatre, named the "Apollo," lately opened for the performance of professionals, bands of whom often visit the island, and of amateurs; the latter pays well. There are two good clubs, but not a single hotel, except of the lowest and most uncomfortable description. Two miles north-east from St. Thomas lies the large harbourless and almost deserted sister-island of St. John's, also Danish territory.

NOTES OF A TOUR IN THE CYCLADES AND CRETE.

II. Tenos.

WE coasted along the eastern shore of Rheneia, which stretches for a long distance beyond the northernmost part of Delos. At one point the island is almost divided in two, the northern and southern portions being connected by an extremely narrow isthmus; in the neighbourhood of this is the cholera quarantine station for Syra. Greece is the strictest of all countries in enforcing

quarantine, as I know to my cost, having once had to pass eleven days on a barren island in the Gulf of Volo, but the result of these preventive measures is remarkably successful. When we reached the extremity of the island, we were caught by a fresh westerly breeze, and danced across over a tossing sea towards the southernmost Cape of Tenos. The town of Myconos was here visible from the sea, its white buildings being clustered together in the recesses of a bay, and many other houses appeared scattered over the hill sides; Delos too was seen well in profile, with the straits on both sides which separate it from the neighbouring islands, and the conspicuous summit of Cynthus. At the end of Tenos rises a lofty mountain, which in ancient times was called Cycinias, and still retains that name in the form of Tsikniais; and, as such peaks are nests of storms, the navigation of the straits which intervene between them and neighbouring islands—as in the similar instance of the passage between Geraestus and Andros—is extremely perilous. Hence Aeolus was supposed to hold his court in the caves of Cycinias; and our dragoman described how he had seen the steamer from Syra to Constantinople forced in an instant to put about and run before the storm. The wind prevented us from steering direct for the town of Tenos, which lies on the western side of the island; so when we reached the point, we worked our way along with oars, and rounded a promontory called Gaidaro, or “Donkey,” from the resemblance of its ridge to the back of that animal, which has suggested many names both in ancient and modern times, as we see from the “Oneian” mountains near Corinth. From this and every other side Tenos presents a wonderful aspect, from the way in which the mountain sides, from top to bottom, have been formed into terraces, mainly for the cultivation of the vine. The wine, which is held in repute in the Levant, is light and somewhat sweet, and agreeable to the taste. The grape which produces the best is considered to be a lineal descendant of the vines of Monemvasia on the east coast of the Morea, the original Malmsey, and the wine is called by that name at the present day.

The town of Tenos, which is better known as Hagios Nicolas, was in former times hardly more than a landing-place, since the Venetian occupants had established themselves on the ridge above; but now its white houses and campaniles have an imposing effect as seen from the sea; while the monastery of the Evangelistria, with the great church in the centre of it, towers over the whole place. We should notice one feature in these islands, which causes them to present innumerable contrasts to other parts of Greece. This is the absence of traces of Byzantine influence. In describing the architecture of the continent of Greece and of European Turkey, it is superfluous to say that it is Byzantine; every monastery, church, or other building connected with the Greek rite is, as a matter of course, built in that style. Here, on the contrary, it hardly ever appears, and the Italian mode of building and corresponding architectural features are everywhere predominant. So, too, while in Turkey and Greece proper the material of which dwelling-houses are constructed is principally wood, in these islands we find them universally built of stone. When we had established ourselves in a house at the back of the town, we went up to the monastery—the extensive buildings of which, occupying three sides of a quadrangle, contain a school and accommodation for numerous pilgrims. We were shown the sacred picture to which the place owes its foundation, the elaborately ornamented church containing numerous votive offerings, and the place beneath it where the picture was found. The story is one that recurs in many countries, viz., that a nun dreamed in the year 1824 that an icon of the Virgin was buried there, and one was found on the spot accordingly. The great days of pilgrimage are March 25 and August 15 (Old Style), and on these

the crowds of visitors are very great; on the eve of March 25, the steamer, in which we were going from Syra to the Piræus, was sent out of its way to Tenos for their accommodation. There are no Hellenic remains in this neighbourhood except pieces of columns, though the old town was on the site of the present one, and the monastery probably occupies the position of the temple of Poseidon, who was the patron of the island. Here, as often, the place of that deity has been taken by St. Nicolas, the guardian of sailors, from whom the town is now named. In the court of the monastery several fine palm-trees were growing, and others were to be seen in different parts of the town. Tenos is considered a very healthy island, so that many people come there from all quarters for the air and water.

On the morrow (March 21) we started on foot, under the guidance of a young man, one of the family at whose house we were staying, to visit the old Venetian town and fort of Exoburgo, which occupies the conspicuous peak above the ridge of the island, that had before attracted our attention by its reddish hue. The path by which we ascended the steep mountain side was in part a paved way, in part a watercourse; but at one time it must have been an important road, when the Venetian authorities occupied the heights above, and even now it must be a considerable artery of communication, to judge from the numerous people whom we met coming on mules from the upper villages, and from the east coast of the island. On the way our guide had a story to tell—one of those myths of observation which we meet with so frequently—about a cave near the summit which had underground communication with one near the sea, so that two Englishmen had explored the way from one to the other. As we approached the foot of the peak, we discovered that the red appearance which it assumed from a distance was caused by an ochre-coloured lichen, which thickly covered its face, with a picturesque effect. To reach the summit we had to make our way to the back of the cliffs, where lies the ruined town of Exoburgo; this name (Ἐξόβουργο) is, apparently, a mixture of Greek and Italian, meaning the suburb which lay outside the citadel; the houses are roofless, only one or two half-dismantled churches being still used. From hence we clambered up the steep slopes in the midst of *débris*, passing at intervals the massive walls, composed of large blocks, by which the accessible portions of the ground were defended. Until lately a Venetian cannon used to remain here, but it has now been removed. The height must be about 2,000 feet above the sea, for it is somewhat lower than Cycinias, which is 2,340, and the view from the summit amply repaid us. As it is probably the most comprehensive panorama in the Aegean, comprising both Europe and Asia, it may be worth while to describe it in detail. To commence from the east: Icaros (Nicaria), which forms a bridge between the Cyclades and the Asiatic islands, appeared comparatively near; then came Samos, more distant, and the coast of Asia Minor between Ephesus and Smyrna; next Chios (Scio), and Peyra (Psara), within which, in the middle of the Aegean, lay a conspicuous rock called Kalogero or “The Monk,” while far away to the north, beyond the east coast of Andros, was seen the faint outline of Achilles’ island, Seyros. To the west of Andros appeared the coast of Attica, near Laureium, with Hymettus behind, but the promontory of Sunium was hidden by Ceos; more in front were Gyaros, and Syra with its white town. Distant again lay the varied forms of Cythnos, Seriphos, Siphnos, Antiparos, Paros, and Naxos. We thus see the two lines of islands which form the continuations of the mountain chains of Eastern Greece; the one starting from Mount Pelion, passing through Euboea, Andros, and Tenos, and terminating in Myconos; the other starting from Attica and ending in Siphnos. Between these lie Gyaros and Syra, while Paros and Naxos may be regarded as the

meeting point of the two lines. Away to the south, and not visible from this point, are the volcanic Melos and Thera (Santorin). Perhaps the most picturesque point in the view was the group formed by Rheneia and Delos, with the two islets between them, and Myconos with its little town: these lay as on a map below us, all separate from one another, with their numerous headlands cut out upon the surface of the sea. After being accustomed to look at these objects on a chart, where the islands resemble a handful of pebbles, lying at random close to one another, it was impossible not to be struck by their size and by the spaces of sea that lay between them—an impression which was amply confirmed by subsequent voyages from one to the other. In tracing out these topographical features with the compass and map, we were greatly assisted by our native guide, who possessed a very accurate knowledge of the localities, and was fortunately unimbued with any classical ideas.

The scene below us, in the island of Tenos itself, was most curious, and I was more than ever struck by the sight of a whole island, almost to the mountain-tops, carved into terraces, which gave evidence of vast labour employed in their construction. At our feet, both to north and south, were irregular uplands, draining some into the eastern, some into the western sea, and dotted with numerous flourishing villages, the white-washed houses of which were surrounded by olives, oranges, and fig-trees. The appearance of these dwellings, with their flat roofs, trim gardens, and battlemented enclosures, is completely that of North Italy; and this is not to be wondered at, as the Italians held Tenos between 400 and 500 years, and it was not until 1718 that it passed out of the hands of the Venetians. This circumstance also explains the large number of Roman Catholics in the island, comprising more than half the population. Of the villages that we saw from this point, those towards the north belonged to the Latin Church, as do most of those on the north-east coast, while those towards the south were partly Orthodox (Greek) and partly mixed.

When we had descended to the foot of the peak, we struck off along the hills to the south, intending to return by a different route from that by which we had ascended, in order to visit a nunnery, the white buildings of which, closely clustered within a wall of circuit, are so conspicuous on the mountain side, lying some 1,500 feet above the sea, that they may be seen from a distance of twenty or thirty miles. As we proceeded thither by an irregular path, sometimes ascending, sometimes descending, we found in a hollow way a drift of snow not yet melted. We passed some curious pigeon-houses, situated in the middle of enclosures, and resembling cottages, with numerous holes for the pigeons to enter, and resting-places for them on the outside; large flocks of these birds were flying about them. There were also numerous windmills in this neighbourhood. Our track lay over soft mica slate, so friable that sometimes we appeared to be walking on tan; this kind of soil, and the numerous springs, are the cause of the great fertility of the island, but at this season of the year the absence of trees gives it a very bare appearance. We were told, however, that later on the country was blue in places from the sweet-scented hyacinths. A visit to a Greek nunnery was a novelty to us, for though Greek monasteries may be counted by hundreds, and we had again and again been grateful in former years for their hospitable shelter, yet a nunnery (μοναστήριον διὰ καλόγρις) had never come in our way. We were doubtful, also, whether our visit would be acceptable, but on this score we found no difficulties, for an old priest, who lives in a little house outside the gateway, and performs the services in the convent, at once ushered us in. The buildings are crowded together most irregularly within the enclosing wall, rising steeply up

the sloping ground, one above another, and winding passages lead in all directions among them. From these emerged female figures in plain black dresses and veils, and we were struck with their good, cheerful, and intelligent faces, while some little girls, who were being educated there, were singularly pretty. In fact, the good air and water of Tenos, which I have already spoken of as causing it to be resorted to from all quarters for the sake of health, generally apparent in the good looks of the population. As Greek monasteries are usually excessively dirty, and communities of women are, I mistake not, for the most part more slovenly than those of men, I was agreeably surprised by the cleanliness and order that prevailed here. They are Idiorhythmic (*ιδιόρρυθμοι*)—a term which is applied to those monasteries where the superior is changed periodically, and where, in respect of meals, &c., "every man is a rule to himself;" consequently they have no common refectory. Idiorhythmic ladies are, I fancy, an advance even on the ideas of Western Europe. They work at various employments, such as making stockings and silk tobacco-pouches ornamented with beads; these articles they sell to pilgrims (*προσκυνηταί*), for they are not allowed to go to the town. After visiting the church, which is handsomely decorated, we were conducted to the reception-room, where the lady superior, sitting in the corner of the divan, which in an Eastern room is the place of dignity, welcomed us, and entertained us with preserve of orange, arrack, and coffee. She said the date of the foundation of the monastery was not certain, but that according to tradition it was twelve hundred years old; the antiquity of everything in the East is, however, greatly overrated. We learnt also from her that there are sixteen nunneries in Greece, of which this is the largest, containing at the present time one hundred and three sisters. They come from all parts of Greece and Turkey.

When our visit was concluded, we descended by a steep path to the town, where we once more embarked, and having a favourable breeze reached Syra before sunset.

CORRESPONDENCE.

OUR OLDEST MS., AND WHO MUTILATED IT.

Clapham, S.W.

Mr. Ffoulkes says that he "would willingly be proved in error to have so much apparent blackness cleared up," as he has described in the article bearing the above title in last month's number of *Macmillan's Magazine*. I have not till now had time to read the article carefully, otherwise I should have taken an earlier opportunity of referring him to an author whose works are indispensable to all critical students of ecclesiastical law. A description of "our oldest MS." was given more than seven years ago in the *Bibliotheca Latina Juris Canonici Manuscripta* of Dr. Friedrich Maassen. The same learned writer has repeated this description, and given more complete details in his grand work, *Geschichte der Quellen und der Literatur des Canonischen Rechts im Abendlande*. I do not say that the study of these works would have convinced Mr. Ffoulkes of the innocence of De Marca and the Ballerini, but it would at least have enabled him to write with a much more extensive knowledge of facts.

Both Baluze and De Marca speak of the intervention of the latter in the publication of the *Bibliotheca Juris Canonici Veteris* as having consisted in compelling the editors to "restore the Sardinian canons to their proper place after the Nicene as they stood in the MS." Mr. Ffoulkes imagines a totally different kind of thing. His readers are left under the impression that the editors were forced to suppress the first portion of these canons in their publication, and that the manuscript was mutilated for the purpose of concealing a fact of untold importance, "involving no less than the fabric of the Papacy." He is not aware that, while writing his article, a witness was at hand in the Bodleian library whose evidence is decisive on this question. The Bodleian library contains a copy—and it is the only copy known to exist—of the *Bibliotheca Juris Canonici*, as printed by the editors before the intervention of De Marca. It suppresses the Sardinian canons entirely. All other copies contain the fragments contained upon the two pages of manuscript mentioned by Baluze as having been brought with them by Voel and Henri Justel when they called upon De Marca. The space required for the insertion of these fragments was obtained by printing the names of the Nicene Bishops in a smaller type than that which was used in the first impression, and is used in all similar catalogues throughout the volume.

There is not a particle of reason for doubting the strict accuracy of Baluze's narrative. The supposition that Baluze was present in a distant corner of the room during the interview which he describes is purely gratuitous. But a mistake of Baluze, who confounds the manuscript now in the Bodleian with another manuscript of Christophe Justel, mentioned by De Marca, confirms Mr. Ffoulkes in an error which pervades the whole of his article. The manuscript of which he quotes De Marca's description at p. 145, "every word of which," he says, "is false," was a different one from that now in the Bodleian. I cannot help it if Pietro Ballerini was also misled by Baluze.

There is no evidence that De Marca had ever carefully examined Justel's MS. until 1680, far less is it certain that he knew that all the missing leaves had been preserved. Christophe Justel had told him that in his youth he had himself cut out the Sardinian canons and placed them at the end of the volume. But even before this deliberate mutilation the manuscript may have been imperfect. The great question between the Justels and De Marca referred entirely to the rightful position of the Sardinian decrees, and fragments of

these decrees were from their respective point of view quite as important as the entire text. It may be perfectly true that the pages now missing had perished before the MS. came into the hands of Justel.

Mr. Ffoulkes speaks of three missing leaves. Dr. Maassen's description is somewhat different. According to him the MS. consisted of nine quires, each of the first eight having eight leaves, the last only six pages. The last leaf of each quire had a special mark, which has sometimes been obliterated. The mark of the sixth quire is *q. C*, of the seventh *q. D*, of the eighth *q. E*, and of the last page *q. F*. On counting backwards it would appear that the whole quire formerly marked *q. A* has disappeared.

I may here mention another fact concerning this manuscript which has escaped Mr. Ffoulkes' observation. He thinks the manuscript must have been written shortly after the termination of the fourth Council. But it certainly is not more ancient than Dionysius Exiguus, for it contains a copy of his preface to an Alexandrian Council against Nestorius. I do not understand what Mr. Ffoulkes means when he says (p. 140) that *this manuscript* is "called 'ancient' by Dionysius Exiguus."

This manuscript contained only twenty Sardinian canons instead of twenty-one. But this is no proof that it omitted anything which is found in other manuscripts. Mr. Ffoulkes is aware that a different arrangement of the canons is found in different versions, and different numberings in most. But he is mistaken in supposing that identity of recension implies identity of division or of numbering. And he is mistaken in talking of the *Prisca Versio* of the Sardinian canons. The so-called *Prisca* only exists for canons of other councils.

It is quite true that the African church (a much more learned church than the Roman) declared, after long and careful enquiry, that no such canon as that quoted in the *Commenitorium* of Pope Zosimus had ever been decreed by any council. This fact, combined with another almost as important, viz., that the Roman church did not know these decrees as Sardinian, led me for a long time to doubt their genuineness. But there is clearly a truer interpretation of these facts. The Sardinian canons were probably not promulgated. They were unknown to the Eastern churches. Even the African churches which took part in the council of Sardica do not appear to have received a copy of the decrees. They are once referred to by a bishop of Carthage in a council of his church, but not quoted from a document. He had been present at Sardica, and he appeals to his recollections of what had been decided there. The case is different as regards the Roman Church. The decrees of Sardica, several of which were most favourable to its authority, were incorporated into its code, but their real origin in the course of time came to be forgotten.

Mr. Ffoulkes treats the notion that Pope Zosimus should have misnamed the seventh Sardinian canon by *mistake* as a dogmatic necessity of Ultramontanes, Gallicans, Jesuits and Jansenists. Why then should the most eminent Protestant historians (Neander and Gieseler, for instance) also admit it? Simply, I suppose, because the mistake is one which is common to members of his church before and after him under circumstances which preclude the suspicions which might fairly be attached to Pope Zosimus. The Roman "Synodus ad Gallos" (Constant col. 695) in the time of Siricius or Innocent I. quotes the thirteenth Sardinian canon as Nicene, and St. Jerome (ep. 83 ad Oceanum) quotes the first canon of Sardica as "decretum in Nicaena Synodo a patribus." The empress Galla Placidia commits the same kind of mistake in writing to Theodosius. There is plenty of manuscript authority for this blunder, not only in reference to the canons of Sardica, but to those of Ancyra, Neocaesarea, Gangra and Antioch. For a superabundance of evidence to this effect, I

* The other two pages now in the MS. were probably recovered after the publication of the book.

must refer Mr. Ffoulkes and those of his readers who are interested in the matter to the great work of Dr. Maassen on the sources and literature of canon law in the West.

P. LE PAGE RENOUF.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Jan. 23,	3 p.m.	Royal Institution: Mr. E. Dannreuther, "Beethoven, with pianoforte illustrations," (Herr Wilhelmj).
		" Crystal Palace Concert (St. James's Hall).
MONDAY, Jan. 25,	7 p.m.	Entomological: Anniversary. Institute of Actuaries.
		" Society of Arts: Cantor Lecture V.
	8 p.m.	Medical.
		" Monday Popular Concert (St. James's Hall).
	8.30 p.m.	Geographical.
TUESDAY, Jan. 26,	3 p.m.	Royal Institution: Mr. E. Ray Lankester on "The Pedigree of the Animal Kingdom."
	5 p.m.	London Institution: Sir J. Lubbock on "British Wild Flowers in Relation to Insects."
	8 p.m.	Anthropological Institute: Anniversary.
		" Civil Engineers.
		" Society of Arts: Capt. Knowles on "The Niger Expedition."
		" West London Scientific Association: Mr. G. S. Boulger on "Free Motion in Plants."
		" Royal Albert Hall (Israel in Egypt).
	8.30 p.m.	Medical and Chirurgical.
WEDNESDAY, Jan. 27,	8 p.m.	Society of Arts: Capt. Bedford Fin on "The Mercantile Marine of Great Britain."
		" Archaeological Association.
		" Geological.
		" Royal Society of Literature.
THURSDAY, Jan. 28,	3 p.m.	Royal Institution: Professor Duncan on "The Grandeur Phenomena of Physical Geography."
	6 p.m.	Philosophical Club.
	7 p.m.	London Institution: Professor Ellis's First Musical Lecture.
	8 p.m.	Inventors' Institute.
	8.30 p.m.	Royal Antiquaries.
FRIDAY, Jan. 29,	8 p.m.	Royal Institution: Weekly Evening Meeting. 9 p.m. Professor Huxley on "Recent Work of the Challenger Expedition, and its bearing on Geological Problems."

SCIENCE.

English Men of Science: their Nature and Nurture. By Francis Galton, F.R.S. (London: Macmillan & Co., 1874.)

THE book by Mr. Galton entitled *Hereditary Genius*—which was published some few years ago, at a time when the labours of his illustrious cousin, Mr. Charles Darwin, were attracting public attention to this field of investigation—was itself noteworthy for the boldness of its theories and its elaborate collection of interesting facts. In this publication, which is intended to be in some sense a sequel to the preceding one, Mr. Galton has partly narrowed the scope of his enquiries and partly extended it to a new class of circumstances. His present aim has been, not so much to prove that scientific ability has a strong tendency to be hereditary, but to discover by an elaborate inductive process what are the leading conditions that go to the making of scientific men—among which conditions innate disposition is shown to occupy a prominent place. His process of enquiry is as follows, and upon its validity must depend all the value of his results: He selected about a hundred

men against whose foremost position in the scientific world of this country no rational objection can be raised; and to them he addressed an exhaustive catalogue of minute interrogatories touching their "nature and nurture," which he defines as "all that a man brings with himself into the world, and every influence from without that affects him after his birth." These questions, to which in all cases sufficient answers seem to have been returned, are contained in the appendix, and comprise almost all the facts with reference to pedigree and individual character which biographers of distinguished men usually care to record. This method is tried under circumstances that are exceptionally favourable, for Mr. Galton was personally acquainted with a large majority of his correspondents, and consequently could secure entire frankness in their communications. If, therefore, the results obtained are vague and unsatisfactory, it can only be because this method of investigation is fundamentally defective, and the subject is incapable of being treated by the application of the statistical calculus. It is not meant to be denied that the conclusions recorded in this volume are of very considerable interest, and illustrate in a very lifelike manner the characteristics of men of science in this country and in the present generation. For example, it is curious to find that these persons usually belong to large families, that nearly half of them are either eldest or only sons, that in height they average nearly five feet ten inches, being somewhat taller than their fathers, and that their birthplaces lie almost without exception outside the agricultural counties in the east and south of England. It is perhaps more important to learn, that out of the hundred scientific men chosen only three claim clergymen of the Church of England for their fathers, though almost all the remainder were born in the professional and upper middle classes; facts from which Mr. Galton draws the two conclusions, that "The pursuit of science is uncongenial to the priestly character," and that "There can be no doubt but that the upper classes of a nation like our own, which are largely and continually recruited by selection from below, are by far the most productive of natural ability; the lower classes being in truth the residuum." And elsewhere we learn that one-third were either at Oxford or Cambridge, and another third at the remaining British Universities. Out of ten scientific men, seven call themselves members of the Established Church, and of the other denominations the Unitarians come next in number. A proportion of only two out of ten confess to a decided religious bias (a phrase of uncertain import); but on the other hand, an overpowering majority state that the religious creed taught them in their youth has had no deterrent effect on the freedom of their researches.

Independence of character is no doubt one of the special qualities which might naturally be expected in scientific men of the generation now passing away; but the other qualities of energy physical and mental, perseverance, and practical business habits, upon which Mr. Galton lays great stress, would probably be found in a similar proportion

among any other classes of men of equal ability. It is, however, on the negative side of their character that Mr. Galton's scientific men make the most astonishing confessions, which are well deserving of earnest attention, and which will afford a justification to the Positivist attack upon the anarchical condition of physical science at the present day. Among the questions were included references to the social affections, strong feelings and partisanship, public spirit, disinterestedness, and politics; but Mr. Galton has not thought the result obtained in the answers on these subjects sufficiently important to be tabulated, and sums them up in the following passage, which well deserves quotation:—

"In many respects the character of scientific men is strongly antifeminine: their mind is directed to facts and abstract theories, and not to persons or human interests. The man of science is deficient in the purely emotional element, and in the desire to influence the beliefs of others. Thus I find that two out of every ten do not care for politics at all: they are devoid of partisanship. They school a naturally equable and independent mind to a still more complete subordination to their judgment. In many respects they have little sympathy with female ways of thought. It is a curious proof of this, that in the very numerous answers which have reference to parental influence, that of the father is quoted three times as often as that of the mother."

The two chapters headed "Origin of Taste for Science," and "Education," are those which bear most directly upon the subject of the book, but it may be doubted whether the results they contain are of much permanent value, either as scientific generalisations or for practical guidance. Mr. Galton naturally dwells at length upon the circumstance that out of ninety-one cases, fifty-six give the answer that their "taste for science was decidedly innate," and only eleven that it was "decidedly not innate." It is true that he qualifies this conclusion by admitting that the term "innate" is not convertible with hereditary, yet surely many more limitations must be imposed before the real lesson can be learnt from these figures. Mr. Galton asserts (p. 148) that his experience justifies him in the belief that men of science are especially manly, honest, and truthful; but to impartial minds the weight of this testimony will be impaired by the fact that he takes occasion on the same page to charge the late J. S. Mill with vanity, on the ground that "he declares in his strange and sad *Autobiography* that he was rather below par in quickness, memory, and energy, and that any boy or girl of average capacity and healthy physical constitution, who was properly taught, could make as rapid progress as himself." Mr. Mill is thus introduced as an example of "men who, owing enormously to hereditary gifts, wish to accredit their own freewill with being the real cause of their success." Attention is drawn to this passage on two grounds: first, as showing Mr. Galton's impatience in dealing with a case that does not fit in with his general theory; and secondly, as illustrating a lamentable flaw in his logic. For Mr. Mill does not attribute his success to his own freewill, but most distinctly to what Mr. Galton would call his *nurture*; and if he had

attributed it to his freewill, it then would, according to his necessitarian philosophy, have fallen, at least to a large extent, under the other alternative of nature. Indeed, the retort cannot but suggest itself that Mr. Galton's opprobrious epithet is more appropriate to those scientific men who praise their natural genius in the proportion of fifty-six to eleven, and blame their education in the proportion of forty-six to ten. Perhaps it would be more accurate to say that this tendency on the part of scientific men to exalt their own gifts at the expense of their teachers should be referred to circumstances which are temporary and peculiar to this country. The almost universal acceptance by this class of persons of Mr. Herbert Spencer's hypothesis of hereditary transmission, the faults of the common education in England when they were young, and the opposition many of them experienced in early life, coupled with the question-begging form in which Mr. Galton framed his enquiries, have perhaps unconsciously caused a prejudice, a species of the *idolon tribus*, which leads them, especially in their own cases, to form a disproportioned estimate of the relative influence of the circumstances which have modified their careers. To strengthen this presumption, a curious fact may be mentioned, namely, that in the case of medical science, whose representatives are better trained in the art of diagnosis, and whose views of human nature are presumably wider than in the other sciences, so many as four out of seven state that their tastes were "decidedly not innate," whereas the general average is only eleven out of ninety-one. It may further be urged that personal reminiscences of early childhood form a very weak species of testimony; for in the majority of cases conscious memory only begins at a date when habit and parental influence have had time to lay the foundations of a second nature. Again, the phrase of "innate taste" is very open to misconception, for in the physical sciences, with which alone Mr. Galton concerns himself, it may mean merely that curiosity about external objects and the operations of nature which may be observed in the majority of intelligent children, and which, with home encouragement and favourable circumstances, may be developed into various scientific aptitudes. Neither Mr. Galton nor his correspondents have sufficiently guarded themselves against the popular mistake which confounds, under the common name of "scientific," a special department of knowledge and a special habit of mind. Now for the former it may well be granted that the taste is innate, and the latter may in many cases be an hereditary gift; yet the two things have no necessary connexion one with the other, and it is precisely because Mr. Galton fails to draw fundamental distinctions of this sort, which lie at the threshold of his subject, that his formidable figures carry with them no conviction.

Indeed, it is almost certain that no great results can be obtained from such a method as that which Mr. Galton has adopted. The personal history of one hundred persons, however typical these persons may be, can never furnish sufficient materials for statistics. To secure results of general

validity, the investigation ought to be extended to other countries, to other times, and to other classes of persons. It was, perhaps, inevitable that Mr. Galton should restrict himself as he has done, because, as he argues, it is only with reference to Englishmen of his own time that he could hope to attain accurate information, and the subject-matter of science offered him peculiar facilities; but this only proves that his instrument of investigation can never be satisfactorily applied. The peculiar merit of the statistical method consists in its being the sole method applicable where the causes are various, mutually conflicting, and of irregular operation; its proper field is where the phenomena to be investigated are indefinitely numerous and capable of being quantitatively ascertained; and its peculiar defect is that it cannot unaided teach us the highest kind of causes, but merely a low kind of uniformities. Now Mr. Galton has adopted a method which is nothing if not statistical, regardless of all these peculiarities, and in his hands it has become a mere simple enumeration of a few affirmative facts, not accurately described, nor balanced by negative examples, and upon them he has based a law of causation of the first magnitude, at least for practical purposes. In the first sentence of this book he explains that "its intent is to supply what may be termed a Natural History of the English Men of Science at the present day," and within the limits of this narrow definition its object may be said to be satisfied. Yet in other passages he expresses, in equally clear language, the opinion that his results are more than a mere description of a small class, and that he has really achieved what he terms "the Sociology of Scientific Men," and has ascertained their general "pre-efficients." Such a result, which would no doubt be of inestimable value, can never be obtained without a deeper appreciation of the problem, a more subtle analysis of its elements, and a wider range of view.

But if this problem is destined to be ever fully solved, it may be confidently suggested that its solution will give no support to the theory of education which Mr. Galton recommends in the last pages of his volume. The scientific men of the future, who are to form "a sort of scientific priesthood," are to be rigorously instructed in the five following subjects, and in these only: (1) Mathematics, and especially its utilised processes. (2) Logic, with the same proviso. (3) Some one special branch of science. (4) Accurate drawing of objects connected with that science. (5) Mechanical manipulation. When such is the practical conclusion at which Mr. Galton arrives, as deducible from the confessions of scientific men concerning their own general education, the outside world may well be permitted to doubt whether the chief representatives of physical science in this country are good judges of the means by which their own subjects may be best advanced, and whether Mr. Galton's method can bear to be tested by the appeal to its necessary results.

JAS. S. COTTON.

Pathshagen, Commentary on the Targum of Onqelos on the Pentateuch, by a French Rabbi of the Fourteenth Century; and *Nethinah Lager, a Commentary on the same*, by Dr. N. Adler, Chief Rabbi. (Warsaw, 1874.)

THE reading of chapters of the Pentateuch in the synagogues was a very early institution, as is clear from Acts xv. 21: "For Moses of old time hath in every city them that preach him, being read in the synagogues every Sabbath day." The Talmud assigns its origin to the time of Ezra, and even dates it back to Moses. And indeed it cannot be later than the time of the Maccabees, when the reading of prophetic chapters was already introduced (see Zunz, *Die gottesdienstlichen Vorträge*, p. 3). The pure Hebrew idiom, which was spoken in a very small district only during the time of the first Temple, was nearly forgotten by those who returned from Babylon. "And their children spake half in the speech of Ashdod, and could not speak in the Jewish language, but according to the language of each people" (Neh. xiii. 24). Very soon, therefore, the necessity was felt for interpreting the sections read in the synagogues in the language of the common people, which was the Aramaic; and this is the origin of the Targum in Palestine and Babylon, as also that of the Septuagint in Alexandria. The Pentateuch having been read in its entirety, either yearly as we find it in use later in the schools of Babylon, or in a cycle of three years or of three years and a half as is said to have been the case in schools of Palestine, we may safely say that the Targum of the Pentateuch is, to some extent, the oldest remnant of the earliest translation of biblical books; next to it comes that of the prophetic chapters read in the synagogues. Was the early interpretation of the chapters only a literal translation as we see it in the Samaritan Targum, or did the interpreter add in many cases a kind of commentary, or at least a paraphrase? This cannot be decided positively; the Targum in its present state, however, represents the latter method, which at all events must have been adopted as soon as the serious study of Scripture began. There was certainly no interpreter by profession at the time when the institution of reading and interpreting was introduced; anyone who was capable of doing so was called on to perform this duty for the instruction of the people. "And he came to Nazareth, where he had been brought up: and, as his custom was, he went into the synagogue on the Sabbath day, and stood up for to read" (Luke iv. 16, *seqq.*). It is therefore more than probable that there was a variety of translators and of translations, of interpreters and interpretations, which were handed down by oral tradition for a long time; when, however, the necessity was felt of committing these views to writing, a kind of Masoretic school arose which endeavoured to obtain a unity of text in the interpretation of Scripture, as was the case previously with Scripture itself. This text is called the Targum of Onqelos, a name which probably represents a corrupted pronunciation of the Greek trans-

lator Akilas, whose name was so popular that the Aramaic translation, put together from various versions, was attributed to him. Dr. Adler is perfectly right when he says in the preface to his commentary that the two translators are by no means identical; we differ only from him in taking the Talmudic tradition, which makes Onqelos the nephew of the emperor Titus, as purely legendary. The importance of this translation is well known, and it is indeed astonishing that, in spite of the use which the early Jewish commentators made of it, and of the fact that it was read every Sabbath after the section of the Pentateuch by every orthodox Jew, there is no earlier commentary on it than the present one by an anonymous French Jew and published from MSS. existing in the Bodleian Library, and in the National Library at Parma. It is no doubt of the highest value for the criticism of the so-called Onqelos, for the author made use of an old Masorah on this Targum, which is perhaps the same as that of which the late Professor Luzzatto published a fragment which is now reproduced by Dr. Adler. We have therefore great pleasure in announcing its publication by the learned Chief Rabbi in the edition of the Warsaw Pentateuch of 1874, with a small preface in which are given all possible indications that could help to find out the anonymous author. Dr. Adler has added to this his own commentary on Onqelos, wherein are contained: (a) grammatical remarks; (b) various readings of the text collated with MSS.; and (c) references to Talmudic interpretations agreeing or disagreeing with the Aramaic translation, and also to Rabbinic commentators who quote this Targum. No doubt the last two points are of importance for anyone who will undertake a critical edition of the Targum based upon other MSS. The elaborate introduction contains details of the life of Onqelos and the method followed by him in the translation. We have already mentioned that, in our opinion, no such person as Onqelos ever existed, though Dr. Adler keeps for the sake of orthodoxy to the Talmudic tradition. As to the method employed by the translators, we may say that it is well described and deserves to be translated into a modern language, for, after all, Rabbinic is accessible only to a few. It is to be regretted that the Polish printers are so careless in their corrections, for the numerous misprints in the commentary often disturb the reader, and are put by him to the account of the editor or author; we know, however, by experience, that no notice is taken of corrections by printers either in Poland or in Germany. We should have desired for the benefit of the public that the learned Chief Rabbi should have published the two commentaries separately; many persons already possess an edition of the Rabbinical Bible, and cannot afford to buy another copy for the sake of two unpublished commentaries, be it even on such an important translation as the so-called Onqelos is. But this we hope will be remedied hereafter.

AD. NEUBAUER.

Elementary Lessons in Historical English Grammar. By the Rev. Richard Morris, LL.D., Hon. M.A. Oxford, &c. (London: Macmillan & Co., 1874.)

FROM its tough and technical character has come a call that the best English Grammar—which Dr. Morris's *Accidence* confessedly is—should be simplified and shortened; and in answer to that call the present *Elementary Lessons* has been produced. But this new book is not only the old one cut down; it is rewritten from beginning to end, is arranged more simply, is less crowded with details, and has a set of new and most apt quotations and illustrations, many of them from the yet unpublished sheets of the Four-text edition of the Early English *Cursor Mundi* which Dr. Morris is now editing for the Early English Text Society. Thus, under *naught*, *not*, we find the proof of these words coming from *no whit*, not a whit:—

"Sco said, ne herd yee *na wight* hou."—Cotton MS. l. 4396.

"Scho said, ne herd ge *noght* how."—Göttingen MS.

"She seide, herde ge *not* how."—Trinity MS.

So again, under *further*, from *forth*, we have:—

"He went him *forth*, and *further* soght."—Cotton, 4107.

"He went *forth*, and *further* sogt."—Trinity MS.

"He went *forth* and *ferder* soght."—Göttingen MS.

The *Cursor* also supplies good instances proving the derivation of *adown* from *of down*, the auxiliary use of *do* early in the fourteenth century; with other good instances like the "*clouden* piler" and the "*firen* piler" of the Exodus, &c. Parallel texts are a godsend to the historical grammarian; and the substitution of their evidence for the guesses of grammar-mongers is a national benefit.

Under the verbal noun in *ing*, proof is rightly given that in such a phrase as "he thanked him *for saving* his life," *saving* is not in origin a participle, but a noun; witness

"Thonkyng him *for the saving* of his life."—*Gesta Rom.*, p. 7.

"*In knowing* of the tid of day."—Chaucer, *Astro-labe*, p. 19.

And under the Infinitive, such phrases as "he is *to blame*" are rightly shown to be gerundial. All through, the book is up to the latest points. It is written by the best of our Early English scholars, who is at the same time a long-practised and skilful teacher. It is very clearly printed and well arranged; and as it costs only half-a-crown, it ought to find its way into every school and family in the kingdom, if only to correct the mistakes and supply the defects of the ordinary popular grammars, so far as their *accidence* is concerned.

F. J. FURNIVALL.

REFORM IN THE UNIVERSITY OF DUBLIN.

The New Academic Council.

THE new Academic Council has at last been chosen, and considering the curious principle of election adopted, the University has reason to congratulate itself on the result. As cumulative voting was permitted, it follows that if, of the seven senior Fellows electing four representatives, any two, even the least desirable, had agreed to plump in turn for one another, they might return one

another perpetually on the Council. This curious result, however, has not taken place.

The Board (of Senior Fellows) have returned the three ablest and most efficient of their number, reserving the fourth place for Mr. David Pigot, a Roman Catholic barrister, and a man of known probity and honour. There was some difficulty in finding a Roman Catholic to sit, as he must (1) be willing to face the opposition of the Ultramontane party in his own Church, and (2) he must not have declared himself for denominational education. Almost every Irish Roman Catholic M.P. had done so for election purposes, so this "right honourable" body was ineligible for a Council professedly elected to work on Mr. Fawcett's non-sectarian principles.

The junior Fellows, following suit, elected Sir Robert Kane, late President of the Queen's College, Cork, together with three of their own body. Sir R. Kane is undoubtedly pledged against denominational education, but he is said to have neglected his duties in Cork, and this, if true, is not a good guarantee for his efficiency on an unpaid Council in the later years of his life. The junior Fellows chosen are not perhaps those that might have been anticipated. But they are able men, and will doubtless do their duty well.

The Professors have elected two medical men—as might be expected from the large number of medical professors on the electoral body—and for the other two places, Dr. Salmon and Mr. Dowden, two men not inferior to any in the University. On the whole, it is likely that the professors are more ably represented than any of the other electoral bodies.

The outside members of the Senate, an heterogeneous body, for the most part non-resident, and only allowed to vote by a mistaken analogy with Oxford and Cambridge, have selected the Bishop of Meath, an ex-Fellow and professor, and a man intimate with University life, not only through himself, but through his brilliant sons at Trinity, Cambridge. They have further selected three decided mal-contents, or at least "reformers"—Dr. Robert MacDonnell, a medical man of eminence, and the author of various pamphlets on education; Mr. Monck, a distinguished resident master, thoroughly acquainted with the teaching of the College; and last of all, the Rev. Dr. Reichel, a noted debater in the Church Synod and the Senate, and formerly a Professor of Latin in Belfast. These gentlemen will adequately represent the feeling which demands large changes in the University, and they will put forth their views forcibly—perhaps even, we fear, eloquently, for surely eloquence is not desirable in a working council of education.

The duties of this new Council are important, but circumscribed. They will have in their hands the control of the studies—the most important branch of University government, and one in which the existing Board, if not inefficient, has been at least somewhat timid and dilatory. They will also have the duty of recommending professors for vacant chairs. But the actual election of professors, as well as the administration of revenues, rests as before with the Provost and seven senior Fellows, who are the trustees of the Corporation, and who could not have been deposed without new Acts of Parliament, if not without a new Charter. Thus collisions between the old Board and the new Council are possible, but not likely, if the Council is made up of such men as those now elected. For, beside the Provost and three senior Fellows, the oldest member of each of the three other divisions may be regarded as conservative in University matters, and these seven votes, including that of the chairman, are pretty certain to be given against violent changes. Nor are there more than three declared Radicals, in the same sense, now sitting on the Council.

As to professions, it is remarkable that the medical profession has three representatives, whereas the bar has but one—a fact doubtless attributable to the absence of any emolument attached to seats

the Council. Had there been good salaries, the bar would probably have secured a large majority.

As to the study of arts, mathematics are admirably represented by Dr. Salmon, Dr. Hart, and Dr. Jellett; but it is much to be regretted that the classical school has not secured any leading voice. Considering the recent development of this school and its good promise, this defect may be regarded as the most serious to be found in the new Council. We will not say that all its present members think themselves unable, or are unable, to offer a sound opinion upon classical matters; but the fact remains that no professor of classics at the University has been elected upon the present Council. It is also to be regretted that, in the case at least, political reasons made themselves felt, and that votes were given rather to aid a mass than to promote the studies of the college.

We have thus discussed the merits of the new academic Council very freely, as it is desirable that it should begin its task without excessive favour or prejudice on the part of the public. It has some defects in its constitution: it has also great merits. The election of some gentlemen because they were Roman Catholics, though it was thoroughly opposed to non-sectarian principle, and theoretically absurd, was yet practically demanded by the cry that for generations to come no Catholic could sit among the governors of the University. That cry is now silenced. When it has died away and been forgotten, we hope that the electors will not abandon the principle of electing men because of their religion, and look merely to ability and experience in the conducting of education.

Meanwhile it must be confessed that Trinity College, Dublin, as the University is usually justly styled, has made no mean progress towards the solution of the vexed problem, which has baffled great statesmen, and troubled the security of more than one government. It may not be amiss to point out in conclusion that this wise and peaceful reform is wholly due to the firmness and determination of Mr. Fawcett, who through good report and evil report, through Conservative opposition and Liberal opposition, through Protestant objections and through Catholic, held fast undaunted to his sound principle; nor do we think that any living politician may look back with equal pride upon a tedious and hard fought, but all the more glorious, victory.

SCIENCE NOTES.

BOTANY.

We have received the prospectus of a *Monograph of the Genus Lilium*, by Henry J. Elwes, F.L.S., illustrated by W. H. Fitch, F.L.S. It is of folio size, uniform with Mr. Bateman's monograph of *Odontoglossum*. It will be issued in guinea parts, each part containing eight plates; the work to be completed in six parts. We have much pleasure in announcing the appearance of such a work, and we have little doubt from the hands it is in that it will be well carried out. Now is the time for the publication of a monograph of the Lilies, for, thanks to the united labours of various botanists, the species of this magnificent genus have recently been reduced to something like order. Specimens will shortly be exhibited at the various learned societies of London and elsewhere. Intending subscribers should communicate with H. J. Elwes, 6 Tenterden Street, Hanover Square, London.

We are glad to see a reprint, from the *Report of the British Association for the Advancement of Science for 1874*, of Mr. Bentham's valuable address on the "Recent Progress and Present State of Systematic Botany," because it merits the attention of all students of biology, and because it is more especially calculated to imbue the mind of the young botanist with sound and philosophical ideas respecting the science of which

it treats. For upwards of half a century Mr. Bentham has laboured in systematic botany, and the nature and extent of the work accomplished are sufficient to ensure him a patient hearing. In none of his admirable addresses to the Linnean Society, probably, is there so much food for thought for the aspiring naturalist; and as a history of the development of systematic botany during the last fifty years, in a concise form from personal knowledge, the present is of great practical use. The two or three pages devoted to a consideration of the limits of orders, genera and species, in so far as they are affected by the doctrine of evolution, are worthy of the special study of those persons who have been so terribly perplexed and shocked at the advanced notions of some biologists.

Foreign Botanical Periodicals for December.—The *Botanische Zeitung* contains the conclusion of Dr. Stoll's paper on the formation of the callus in cuttings, and the two first parts of an article on the history of the germination of Cyclamen, by Dr. Gressner, in which the author examines not only the morphological, but likewise the histological changes which the embryo undergoes. *Bulletin de la Société Royale de Botanique de Belgique*—Notes on the Florule of Kraene-Poel, one of the few undisturbed spots left to Belgian botanists, by E. Vander Meersch; "Primitiae Monographiae Rosarum," by François Crepin—this occupies fifty pages, and is only one of several contributions on the same subject. It is a great pity that writers on critical forms should be so copious, and at the same time neglect to summarise their labours, which otherwise must remain useless to those who do not make a special study of the same group. M. Crepin here treats of some Asiatic species, devoting the space mentioned to the consideration of eleven species. The last number of the *Linnaea* to hand contains the continuation of Bückler's "Cyperaceae of the Berlin Herbarium," and "Novitates Bryothecae," by C. Müller.

THE *Botanical Magazine* for December and January contains figures of some very interesting plants, in addition to the *Rheum* previously mentioned. *Fuchsia procumbens* is a very remarkable and anomalous-looking species from New Zealand, where two or three outliers of this otherwise American genus are found. This is an elegant trailing species with apetalous flowers. *Boucerosia Marocana* is a new species of this curious genus, one of the numerous new plants found by Dr. Hooker and his companions on their Morocco expedition. A strikingly beautiful species of the Australian genus *Eucalyptus*, *E. cornuta*, is represented on tab. 6140. The flowers are borne in dense heads, and the long horn-like operculum of the calyx is of a brilliant red. When the operculum falls, the numerous long slender yellow stamens spread out and fall over like the plumes of a bird of paradise.

THE *Journal of the Asiatic Society of Bengal*, Part II. No. ii. 1874, contains the first part of some contributions towards a knowledge of the Burmese flora, by S. Kurz. This portion extends to one hundred pages, and includes the Polypetalae, up to the end of the Geraniaceae, and will doubtless prove of considerable service to botanists engaged upon the Flora of India.

MR. ARCHER contributes an article to the last part of the *Quarterly Journal of Microscopical Science* on Apothecia occurring in some Scytonematous and Sirospionaceous Algae, in addition to those previously known, or lichenous fructification on algae. This is no new discovery, except so far as the species are concerned, but in the present state of the alga-lichen theory everything bearing upon the subject is read with interest. Mr. Archer was unable to detect spermatogonia in the specimens bearing the apothecia, though he, as well as Bornet, had previously found them in *Ephedra pubescens*, an organism formerly associated with the same group.

AN excursion by the Scottish Botanical Alpine Club to the Aberdeenshire and Forfarshire mountains in August last, resulted in the discovery of two species of plants new to the flora of Britain, as we learn from the *Journal of Botany*. The plants in question are *Carex frigida* and *Salix Sadleri*, the latter a species new to science: both were found near Loch Chander (Ceann Moor), Aberdeenshire, by Mr. Sadler.

THE tenth volume of the *Journal of the Royal Agricultural Society of England* contains, among other matters, an interesting report on the agriculture of the Austro-Hungarian Empire, by Professor J. Wrightson, from which we glean the following particulars. The study of the systems of agriculture practised in the vast plains of Hungary occupied the principal portion of the reporter's time. Some idea of the extent of these almost perfectly level expanses may be formed from the fact that the Alföld, or plain of Lower Hungary, alone comprises an area of 37,400 square miles. The two plains of Upper and Lower Hungary embrace the whole of the *tigland*, or deep land; and the soil throughout is a rich black mould overlying water-worn gravel. It is apparently an alluvial deposit, formed by the rivers Danube, Theiss, Drave, and their tributaries. The natural fertility of the soil is frequently injured by the efflorescence of soda-salts on its surface, especially in Lower Hungary, where immense tracts of flat land are thus rendered unproductive, forming the plains of natron between Arad and Debriczin. Hedges or any other visible divisions of the land, except the long lines of acacia trees which usually bound the nobleman's estate, are entirely absent.

One of the most interesting features in the cultivation and ownership of the land is the existence of distinct communities, forming isolated villages or hamlets. These villages are surrounded by the land belonging to the inhabitants, each of whom is a free proprietor. Each house is detached and exactly resembles the next, and having seen one village you know the general features of hundreds. It is termed peasant farming, each member owning and cultivating a portion of the parish (*gemeinde*), grazing his stock on the "common" proper surrounding the arable part of the land, and finally gathering his crops and stock around him at his homestead. Towards evening, the herds of cows, long-haired goats, and woolly swine are driven back to the village for the night, each turning in at its own gate, not to come out again until the herdsman's horn echoes through the village in early morning.

Professor Wrightson says it is difficult to give an idea of the Hungarian village to one who has not seen it. It is ushered in by a pond, evidently formed by excavating for clay to build the houses. The road runs through the little town, but no attempt appears to have been made to improve it, the entire space between the two rows of detached white thatched cottages being used as such. Once through the village, which ends, as it began, with a shapeless pond, you are in the open country, partly pasture, but more generally arable, in a more or less imperfect state of cultivation. Wheat and rye stretch away on all sides. The next feature to arrest the eye may be a belt of single trees, which, on coming up to it, you find to be the boundary of a large estate, where, in the place of peasants, are the stewards and labourers of the Count, pursuing a systematic course of agriculture. These domains and peasant lands alternate. The estate is usually better cultivated and yields better crops, and is laid off into square fields of from twenty-five to forty acres each, defined by grass drives, bounded on either side by trees. The value of land in Hungary is rising, but neither skill nor capital has yet been brought to bear upon the greater part. The price usually ranges from 14s. to 28s. per acre, according to quality and situation; and it is let at from 21s. to 28s., or even 35s. per acre.

In the Theiss district the land will grow wheat year after year without manure. In fact, manure

can only be applied for rape, Indian corn, or other crops, as wheat grows too luxuriantly after dressing. A curious fact connected with the culture of tobacco is mentioned by Professor Wrightson, to the effect that sheep do very well upon it in a green state as a forage crop.

The feudal system was abolished in 1848, and the serfs became free allodial owners. The whole area of Hungary is pretty equally distributed between great proprietors and peasants. Some large landholders would be very glad to let portions of their estates to good English and Scotch tenants on liberal terms. Most of the vast estates are in the hands of their owners, and thus, where in England we should have hundreds of independent tenant farmers, millers, smiths, coal-owners, brewers, &c., we have all concentrated and worked as it were for the benefit of one individual. One of the estates belonging to the Archduke Albrecht alone comprises 164,200 acres!

AFTER having been at work for upwards of two years, the Sub-Wealden Exploration Committee has determined to abandon their celebrated boring, and to commence working afresh upon an entirely new bore-hole in the immediate vicinity of the old one. Since the unfortunate accident of dropping the boring-tool, to which we referred some months ago, the work has been completely at a stand-still; the time having been consumed in fruitless attempts to extract the lost auger, and to remove the rubbish which has fallen into the bore-hole. A careful survey has proved that the 1,000 feet of bore is out of the perpendicular by a few inches, and the attempt to remove the obstruction has therefore sorely tasked the engineering resources of the Diamond Boring Company. In the face of these difficulties it was decided, at a meeting of the committee held at the Museum of Practical Geology on Friday the 15th inst., that no more work should be spent upon the old boring, but that a new bore-hole should at once be begun. It had been proposed to line the original bore to a considerable depth, at a cost of about 400*l.*; the Diamond Boring Company has now undertaken, we believe, to sink the new bore-hole to the depth of 1,000 feet at the moderate cost of 600*l.*, so that after all the bold step just taken will entail an additional outlay of only about 200*l.* It reflects great credit upon all concerned in this work, and especially upon the honorary secretary, Mr. Willett, that the enterprise should be carried on with such spirit; for one could hardly have been surprised, considering the unexpected difficulties of the case, if the committee had decided to altogether abandon the experiment. Let us hope that the Netherfield bore-hole No. 2 may be more successful than its ill-fated predecessor.

Der Naturforscher (December 19) gives an account of experiments made by Herr Moritz Traube on what he calls "inorganic cells," which were suggested by Graham's discoveries in dialysis. If a drop of gelatine solution is acted upon by gallic acid, so that a film of a leathery substance is formed round it, an artificial cell is produced; and this when placed in a weaker solution of gelatine will swell and exhibit a physical growth through the endosmose that takes place. Cells with these artificial membranes will have a tendency to thin out at the top, their lower parts being thicker from the downward gravitation of the particles, and as fresh fluid enters by endosmose the weakest part will be most stretched. The existence of these conditions in plant cells will favour their upward growth. Herr Traube succeeded in forming cells of different materials, and in imitating many physical processes of growth. The enlargement of the cells in his experiments differs materially from the extension of a soap-bubble by blowing more air into it. He observes phenomena of intussusception analogous to those of plant-cells. The enveloping membrane of his cells is formed by chemical precipitation, which stops when the

membrane thickens, and its interstices no longer allow fresh molecules of the membrane-forming material to enter. Endosmose of the surrounding fluid into the cells swells them, stretches their membranes, enlarges the interstices, and allows fresh material to enter, and a new layer of membrane to be formed. Thus far they imitate living cells.

M. BROQUEREL observes that among the physico-chemical forces influencing organic functions, the electro-capillary forces are the most important, and that in order to produce them nothing more is required than permeable tissues separating two liquids of different natures, which find in the organism the conditions necessary for their production. Arterial blood leaving the left auricle of the heart, before becoming venous blood, traverses capillary vessels which bring it in contact with muscles covered with exuded liquids. Electro-capillary actions are thus excited, subserving to their nutrition and growth. In a series of experiments, arterial and venous blood were brought into contact with various liquids, such as bile, urine, wine, grape-juice, and sugar solution charged with carbonic acid, and both were found negative in relation to the liquids; and it may be supposed that the same thing occurs when arterial blood in the capillaries comes in contact with the liquid exuded by muscles. The direction of the electro-capillary currents is such that the interior walls of the capillaries are the positive electrodes of couples functioning as chemical forces, and their exterior walls negative electrodes. There is thus oxidation in the interior of the capillaries, and reduction on the side of the muscles. The interior of a muscle is usually negative in relation to the fluids that moisten its external surface: the electro-capillary currents proceed from the inside outwards, and this direction gives oxidation within and reduction without.

In fruits such as grapes, apples, pears, and in roots, as potatoes, carrots, and turnips, there are similar electro-capillary currents. In contact with water, the interior parts are constantly found to be positive. Thus, when fruits are moistened, their interior layers next to the external tissues tend to ceaseless oxidation; salt water produces opposite effects.

Before electro-capillary currents were known, it was supposed that in transmitting an electric current, for medical purposes, into the interior of an organised body, no electro-chemical action would ensue unless solid bodies, such as wires, conducted the electricity, and served as electrodes. Now, however, it is known that an infinitely thin layer of liquid adhering to the walls of a permeable tissue behaves like a metallic film in electro-chemical decompositions, and we may conceive such actions taking place in organisms, and producing very complicated results. (*Comptes Rendus*, December 7, 1874.)

M. MÉGNIN, writing on the transport of virus and propagation of disease by certain flies, points out that the mischief is effected by those which have penetrating mouth-organs, and not merely suctorial organs, as the common blow-fly. Some flies of the genus *Stomoxys* were observed at the camp of Gravelles feeding on the matter of an erysipelatous gangrene on a horse's leg. The proboscis of a fly so engaged contained a liquid in which the bacteria of putrescent fermentation could be seen with a microscope, and inoculation with a proboscis in that state produced voluminous ecthyma. In 1863, a gnat (*Simulium*) was supposed to have occasioned a severe epizootic by the action of its own poison, and M. Tisserant, a veterinary professor, to whom was confided the duty of investigating the disorder, came to this conclusion. M. Mégnin says he only saw half the truth: that the gnats did transport the poison, but got it first from animals that were affected. He exclaims, "it is certainly in the same way that the Tsetse acts." This may be, but it is not proved by experiments on other flies. M. Mégnin's paper is in *Comptes Rendus*, December 7, 1874.

MEETINGS OF SOCIETIES.

NEW SHAKSPEARE SOCIETY (Friday, Jan. 8).

F. J. FURNIVALL, Esq., Director, in the Chair. The names of ten new members were announced. The thanks of the Society were voted to H.R.H. Prince Leopold, Vice-President, for his present to each member of a copy of the Parallel-Text Quartos of *Romeo and Juliet*, 1597, 1599; to Mr. P. A. Daniel for editing the same, and the separate reprints, for the society; to Dr. Ingleby for 370 copies of his *Still Lion*; and to Mr. Furnivall for 500 copies of his Introduction to *Gervinus*, for the members of the Society. The paper read was by Dr. E. A. Abbott, on "The First two Quartos of *Hamlet*, 1603, 1604." Dr. Abbott contended that the incomplete Quarto of 1603 contained nothing of Shakspeare's that was not in the second Quarto of 1604, and did not therefore represent an earlier state of the play, although it did contain large alterations of Shakspeare's work by the Pirate who arranged for press the incomplete notes and recollections of the play shown in the second Quarto. These alterations were due to the Pirate's desire to make the play more of an acting, and less of a philosophical one. Mr. Furnivall could not persuade himself that the very different view of *Hamlet*'s mother taken by Q1, a view of such great importance in regard to the motive of the play, was due to the compiler of Q1. The change from her innocence in Q1 to the doubt of it in Q2 was Shakspeare's change. He believed that Shakspeare first partially recast the old *Hamlet*, and that that recast was, more or less, represented by Q1. Mr. Simpson also held that Q1 represented the old Corambis *Hamlet* as partially recast. The change of names in Q2 showed it. When Q2 was produced, then the old play would be printed, with, possibly, portions of the new play inserted. Other cases of this occurred. Dr. Nicholson and other members also contended that Q1 represented an earlier version of the play than Q2. Dr. Abbott admitted that he had perhaps assigned too much to the Pirate in attributing to him the changes—almost recasts—of the characters of the Queen and King, &c.; these were perhaps due to the old play; but he still doubted whether Q1 contained more than one line worthy of Shakspeare which was not in Q2. The meeting asked Dr. Abbott to print his paper, though he had said he would not do so.

ROYAL GEOGRAPHICAL SOCIETY (Monday, Jan. 11).

At the meeting of the above body, an interesting letter from Colonel Long, who is attached to Colonel Gordon's expedition in Equatorial Africa, was read. Writing under date October 2 from Gondokoro, he stated that in April last he started to visit Mtesa, King of Nganda, and after thirty-eight days of painful marching reached his destination, where he was received with pomp, and made a stay of twenty-nine days' duration. After some days' delay, he succeeded in obtaining leave to return by the Victoria Nile (Somerset). He launched his canoe upon the lake, emerging from Murchison Creek, and found it (the lake) to be from twenty-five to thirty-five feet deep, and the opposite shore from twelve to fifteen miles distant. The superstition of the natives prevented him from reaching Urondogani by way of the Ripon Falls, and he returned to Mtesa. Robbed of his baggage and deserted by his porters, he determined to make for the river, and after two days' incessant rowing reached a lake about twenty-five miles wide, which formed apparently a great reservoir of the waters of the Victoria Nyanza and of the surrounding plateau. After defeating 400 men of Keba Rega, he reached Foweira, near the Karuma Falls, on August 20, in a sorry plight, and finally arrived at Gondokoro on October 18. He had persuaded Mtesa to send his ivory to Gondokoro instead of to Zanzibar, and with the idea of further developing Egypt's monopoly of ivory, Colonel Gordon

intended soon to launch one steamer on the Albert Nyansa, and another to work up from Foweira to the Victoria Nyansa.

The next paper read was one by Captain Elton, giving an account of the country between Dar-es-Salam and Kilwa, which he had traversed while in search of slaves held by British Indian subjects. This paper afforded ample proof of the continued activity of the land routes of the slave traffic and its concomitant horrors.

The last paper was read by Major Erskine on a voyage made by his son in South-East Africa. The journal forming the groundwork of the paper had been written from memory and from the notes of M. Dubois, Erskine's interpreter, the original with the observations having been lost in a flood. In consequence of a deputation from Umsila, king of the Gosa, asking for protection for trade, Mr. Erskine and M. Dubois started in a schooner in June, 1871, and after some difficulty with the Portuguese Governor at Delagoa Bay, made for the interior. The abolition of the slave trade has depopulated Inhambanè and Delagoa Bay, but legitimate trade is fast restoring prosperity to both. The Tongas, who inhabit this region, are industrious, and possess agricultural and manufacturing abilities. One of the chiefs was persuaded that Erskine's advent heralded the occupation of the country by the British, and was delighted at the idea. Erskine observes, with reference to the navigation and commerce of the great Limpopo river, that it is difficult of entry, has sixty miles of navigation, and flows through a fine alluvial valley fifteen miles broad, while its productions are hides, horns, native gums, ground nuts, &c. It is close to Leydenburg, in the Transvaal country, where bread-stuffs are grown as well as wool, and the distance to the new Gold Fields is 170 miles. He devotes a large portion of his narrative to an account of the Umsila country and of his stay there. Since his return to Natal, he has started for a fourth expedition, and, according to last advices, had reached Delagoa Bay, where he is collecting ivory.

LONDON AND MIDDLESEX ARCHAEOLOGICAL SOCIETY (Monday, January 11).

THE Rev. Thomas Hugo, M.A., V.P., in the Chair. Mr. F. A. Burt exhibited Roman and mediæval pottery recently obtained from excavations in Giltspur Street, City. Mr. C. Roach Smith, F.S.A., a Romano-Celtic bronze sword, dug up near Broadway Tower, in Gloucestershire; a similar weapon, though of inferior size, discovered some time since near Royston, was contributed by Mr. Thomas Milbourn. Mr. J. E. Price, honorary secretary, read a communication from Mr. C. Roach Smith, F.S.A., setting forth the claims of the late M. de Caumont, of Caen, upon English antiquaries. A statue to this distinguished man is about to be erected at Bayeux, and it is probable that many fellow-labourers in this country will wish to co-operate in the work. To "M. de Caumont may be assigned the foremost place in popularising archaeology as we now see it through France and England." As a young man he took an active part in the formation of the Society of Antiquaries of Normandy, and in 1834 he conceived and established for a wide field of action the Société française d'Archéologie. "The Revolution at the close of the last century had destroyed or injured many of the finest ecclesiastical monuments; scarcely any of the cathedrals and churches had escaped its ravages; while other valuable remains of ancient art had also suffered. In spite of the efforts of M. Guizot and other enlightened men, vandalism remained rampant. M. de Caumont saw that nothing but a widely extended union of the national educated intellect could counteract the evil, and, unassisted by State patronage, to the nation he appealed. The result was the Société française d'Archéologie, and simultaneously the *Bulletin Monumental*, a bi-monthly illustrated journal, which at the time of the death of its founder and editor had completed

its eight and thirtieth volume." This journal affords the best means of estimating properly the character of M. de Caumont; it is his best biography; it shows his wonderful perseverance, his unselfish devotion to science, his intelligence and liberality. He possessed an independent property, and, fortunately, the heart to make it useful. He visited all parts of France, examining for himself ancient remains of all kinds, which he so happily described. He established correspondents in all parts, everywhere encouraged research, and saved many important monuments.

"His great work, the *Cours d'Antiquités Monumentales*, extending from the year 1830 to 1844, comprises six volumes and six atlases. It embraces the Celtic and Gallo-Roman eras, religious architecture of the Middle Ages, military and civil architecture, and baptismal fonts, altars, tombs, paintings on glass, frescoes, enamels, and wainscoting. The *Abécédaires*, in octavo, four volumes, are, as termed, the rudiments of Archaeology." A graceful and pleasing memoir of M. de Caumont has been published in the *Bulletin* by his successor, M. de Cougny.

An interesting paper on "The Grammar School at Barnet, Herts," was read by the Rev. F. O. Cass, M.A. A coloured drawing of a wall-painting existing at Earl Stonham Church, in Suffolk, was exhibited by Mr. Golding, and described at length by Mr. John G. Waller.

ANTHROPOLOGICAL INSTITUTE (Tuesday, Jan. 12).

PROFESSOR BUSK, F.R.S., President, in the Chair. Mr. T. I. Hutchinson, late H.M.'s Consul, Callao, read a paper on "The Anthropology of Prehistoric Peru." The paper commenced with a notice of how little is known up to the present time about the glorious days of Peru, long before the time of the Incas—agreeing with Mr. Baldwin as to the original South Americans being the oldest people on the Continent. The grandeur of colossal work in the extent of the ancient burial mounds was shown by illustrations. A comparison of these, examined by the author in Peru, was made with those explored by Messrs. Squier and Davis in the valleys of the Ohio and the Mississippi. The prehistoric architecture of Peru, described by Professor Raimondi in his recent work on the mineral riches of the department of Ancachs, were mentioned as highly interesting; more particularly the tombs cut out of solid blocks of diorite in the valleys where sandstone is the geological character, thus proving the enormous capacity for work of the ancient Peruvians in transporting these stony masses over the Andes. So small was the author's faith in Spanish accounts of South America, that he inclined to the belief in some future explorer finding the mythical "cradle of the Incas" in the National Library at Madrid instead of in the lake of Titicaca, to which latter place it is assigned by the Hakluyt Society.

A paper, by Dr. George Dobson, was read "On the Andamans and Andamanese." After giving a sketch of the geographical position of the Andaman islands, and their geological and zoological relations to the Asiatic continent, the author passed in review the various theories that had been propounded by eminent biologists to account for the origin of the Andamanese. He strongly inclined to the views of Mr. Wallace and of M. de Quatrefages that the Adamanees are Nigrites, or Samangs from the Malay Peninsula, and was opposed to the theory of their descent from shipwrecked African negroes, on the ground rather of the dissimilarity of their manners and customs than of their physical characteristics. It was impossible, however, to account for the presence of the wild tribes of Southern India, or of the peculiar Samangs of the interior of the Malay Peninsula, surrounded by races with which they have no connexion whatever, except on the hypothesis that they are the few surviving descendants of a woolly-haired people which in ages past occupied lands south of the Himalayas when the continent of Asia included within its southern

limits the Andamans, Nicobars, Sumatra, Java, Borneo and the Philippine Islands; and that the present inhabitants of the Andamans and the Nigrites of the Philippines are also the remnant of these ancient Nigrito inhabitants of Southern Asia, which have almost disappeared before the invading Aryan and Mongolian races. Dr. Dobson exhibited a series of photographs, taken by himself, of Andamanese men and women.

GEOLOGICAL SOCIETY (Wednesday, January 13).

J. EVANS, Esq., F.R.S., President, in the Chair. In a paper "On the Kimeridge Clay of England," the Rev. J. F. Blake traced the lithological and palæontological characters of this formation as it stretches across the country, with interruptions, from Dorsetshire to Yorkshire. The sections exhibited in Lincolnshire have been specially studied by the author. He believes that our Kimeridge Clay admits of division into an Upper and a Lower group of beds, but that no Middle group, such as is found on the Continent, can be recognised in England. The Upper Kimeridge series consists chiefly of bituminous paper-shales, reaching a thickness of upwards of 600 feet; while the Lower Kimeridge is formed mainly of a great mass of clay, perhaps nearly 400 feet in thickness. Below the true Kimeridge Clay there occurs a thin series of sandy beds, well exhibited near Weymouth, and termed by the author the "Kimeridge Passage Beds." When the Coral Rag is absent, as in Lincolnshire and Yorkshire, these transition beds also disappear. After Mr. Blake had entered into a critical examination of the Kimeridge fossils, a new Chelonian from the Kimeridge Clay—the oldest yet discovered in Britain—was described by Professor H. G. Seeley under the name of *Pelobatochelys Blakii*. Mr. A. J. Jukes-Browne read a paper "On the Cambridge Gault and Greensand," in which he advocated the view that the thin nodule-bed, so valued for the sake of its coprolites, should be placed at the base of the Chalk Marl. In the absence of true Upper Greensand, the coprolite-bed rests directly upon an eroded surface of Gault Clay. The rolled and phosphatised fossils of the nodule-bed appear to have been in large measure derived from the Upper Gault, while other fossils, less altered, seem to be species proper to the Chalk Marl. The author has carefully studied the invertebrate fauna of this debatable deposit, and has effected considerable revision in the list of fossils. *Ammonites Taitensis* (Pussh), an ammonite new to Britain, recently found in the Oxford Clay of St. Ives, Huntingdonshire, was exhibited by Mr. J. F. Walker, of York.

PHILOLOGICAL SOCIETY (Friday, January 15).

HENRY SWEET, Esq., in the Chair. A paper was read by F. T. Elworthy, Esq., on "The Dialect of West Somerset," which he treated particularly with reference to its pronunciation and grammar. The reader maintained that dialects are not disappearing so quickly as is generally supposed; that although words are constantly dropping into disuse, new ones are as certainly taking their places; and these, from having the stamp of the dialect impressed upon them, seem to hand down unaltered the archaic pronunciation. It was asserted that the Quantocks and Taunton are the limits of the districts of East and West Somerset, and not the Parret. The Western dialect had been but little studied, and was comparatively little known, although it was much richer in vocabulary and more expressive in speech than the East Somerset.

The reader pointed out the probable Normanism in the difference made in the sounds of *say*, *day*, *paay*, *maay*, and in carefully going through the vowels, he gave no less than six distinct sounds for the diphthong *ea*.

Final compound consonants were nearly always reduced to simple ones, and the hard dentals and labials constantly softened.

The paper, which was unusually well received, was very fully illustrated by a variety of local idioms, and in the discussion which followed Mr. Sweet remarked on the great value of the dialect in preserving in a living form the old sounds of the *w* before such words as *wrestling*, *wreath*, and the broad *ay* in *hay*.

Prince Lucien Bonaparte said that the chief distinction between the dialects of West Somerset and Devon was the use in the former of the periphrastic present indicative instead of the inflexion *eth*; that West Somerset must be classed by itself; that the remarkable inflexion by which transitive verbs receive a neuter signification when used without their object, is found in the dialects of the South-West of England, in Basque, and in Hungarian, but in no other languages, ancient or modern.

FINE ART.

SIXTH WINTER EXHIBITION OF OLD MASTERS AT THE ROYAL ACADEMY.

(Third Notice.)

LET me begin by rectifying a double confusion in what I said last week about Mr. Fuller Maitland's picture of the Virgin appearing over her tomb to Saints Francis and Bonaventure (No. 187). I said it was "ascribed by Young Ottley, whose property it was and who engraved it, to Giotto; and now to Fra Angelico. Messrs. Crowe and Cavalcaselle (vol. i. p. 589) pass it as the work of Angelico." Now there are two pictures in the possession of Mr. Fuller Maitland ascribed to Angelico. One is an Entombment of the Virgin, with Apostles; the other is this Vision of the Virgin over her tomb, with Saints Francis and Bonaventure (see Waagen, vol. iii. pp. 2, 3). Both formerly belonged to the collection of Young Ottley. The Entombment, really by Angelico, was engraved as a work of Giotto; not however by Young Ottley (that was my mistake), but in the *Etruria Pittrice*. The other picture now exhibited has not, so far as I know, been engraved. That it is a Sienese work of Sano di Pietro or Matteo da Siena is I think certain. When I said "Messrs. Crowe and Cavalcaselle pass it as the work of Angelico," I had not discovered what is the fact, that those authors had mixed up the two pictures, the Entombment by Angelico, and this Virgin appearing to Francis and Bonaventure which I say is Sienese, and had described them as one. That they have done so is evident from the passage referred to, i. 589. Their book is so justly the foundation for all students following them to work upon, and their general diligence so admirable, that I am sure they will thank me for pointing out the error.

The Exhibition is strong in landscapes of nearly all schools, and contains one of the Venetian school which is a revelation. There is great charm in the two unnamed Venetian pieces of different hands contributed by Mr. Graham (169, 173). In each there is a pleasant mixture of romance with primness, of formalism with nature; with a pleasant enigmatic touch in the figures; which in the former case belong to the sacred order, in the latter to the profane or fanciful. But such minor items disappear in comparison with the landscape of Titian lent by the Queen (127). This, I understand, hangs usually in an imperfect light in Buckingham Palace. It requires a good light, and is worthy to hang in the best place in any gallery in the world. When I spoke of chords mightily struck by the most ancient masters in landscape, it was of this picture that I was thinking. It is not too much to say that whoever has not seen this picture has a great gap in his knowledge both of landscape art and of Titian. We are accustomed in Titian's figure-paintings, both Christian and Pagan, to trees of splendid growth and sweep, with a cluster or two of perfect flowers; to rich green boskage beautifully made out, and slopes and champagnes of the brown that shades anon into

solemn transparent blue, and distant mountain-spurs among the clouds with shafts of light that strike down and touch their indigo into gold. In the *Ariadne*, the *Noli Me Tangere*, and the *Virgin and Child with St. Catherine*, of the National Gallery, we have in England three signal examples of this manner of his in backgrounds; and even in the present Exhibition, next to the piece now under discussion, there hangs a good though somewhat injured specimen (No. 126). But neither these, nor the best of the master's pen drawings of landscape, could have prepared us for the completeness and overwhelming power of the picture now before us. It is in Titian's most careful manner, and almost without injury; for I suppose the conspicuous seam across the middle could easily be set right. In the foreground, a shepherd follows his flock round a copse on the left; and on the right rises one strong tree-stem, and another not quite so near. We look downwards from a rise: first, upon a noble clump of trees growing on a swarded knoll—such trees and such a sward as you get in the park backgrounds of Gainsborough and Reynolds; then some bare brown ground a little farther off on the left, and a path leading down to a group of farm buildings. Beyond these a partial storm lowers over miles and miles of level woodland and estuary—a narrow dusky bar of raincloud stretching across the sky and sending dusky drifts of rain along the blue. A blue both in land and sky how solemn and profound! a dusk how sudden and full of menace! and how the distant church spire in the plain, which the shower has all but blotted out, seems now clearer and now fainter as you look! and how the farthest mountains, the sharp and slanting mountains of Friuli, stand out in pure air beyond the storm and against the white horizon clouds! For upon that solemn and profound blue of the sky there roll two strata of clouds—the upper stratum pure and white and calm, and it is against this that the far mountains come out—the other, and this is the storm cloud, level and low and black. There seems scarcely anything which the moderns have attempted, in this order of art held peculiarly their own, and which is not here done with a strength, a majestic and full-toned poetry, such as even the greatest moderns have not come near. What is the good of words? The reader must take the picture by itself, and let it come upon him gradually. I say by itself, because at first sight it looks black upon the walls, being in a different key from anything else. Indeed, it is not much lighter than the same master's ruined picture of the Pesaro family at Venice. But look a little, and you will see how luminous this darkness is. The central point of high light is one curl of the white cloud in the left-hand part of the sky (and the mere manner of laying on this proclaims a mastery of the riches of the brush such as no other man has had). Everything else is kept down so as to come into right relation with this key-note. The light is led in masses about the sky by the re-appearance of the white system of cloud here and there beyond the edges of the storm; it strikes faintly along the plain in gleams on estuary and meadow, a little more strongly upon the path, where two figures move near the cottage; it surrounds with a soft radiance the shadow which the great trees cast upon the sward in the middle distance; it winds about the copse in the foreground, lighting the fleeces of the flocks and the white loin-cloth of the shepherd; its last echoes are caught in silver gleams high upon the near birch-stem and in the foliage beyond. Noble and beyond praise as a scheme of light and shade, consummate as a study of nature in poetry and in grasp, this landscape calls above all for admiration as a lesson in the magic of the Venetian colouring. In any other school colouring so dark would have been ink. Here is not a single opaque point; not a shadow, however deep, that is not full of inner light. The dense cloud lets through the sense of sky, the dense shower lets the sense of landscape through, in a manner that is nature's own.

In the sombre country beneath the storm, between the dim gleams of water, the eye can sink for ever into the softness of the darkened woods. The indigo and deep brown and dun glow upon you presently with a sense of I know not what wonderful gold and azure. And all this with a simplicity of touch as unhesitating as it is inexplicable. Human eye and hand never worked together with more imperial certainty for a nobler result. Is it worth while pointing out the few negligences of the giant?—that the figure of the shepherd is too short, that a dog chasing a deer in the middle distance is too large?—that the sky and storm being evidently with the distant landscape the painter's chief point, he has painted the two tree-stems of the foreground so thinly over the sky that the clouds show a little through one and a great deal through the other? Let us be thankful for the chance of studying here—while we wish we had the chance of studying it always—so rare a masterpiece.

After this, the various phases of later landscape, for a long time to come at least, cannot but seem partial and incomplete. The art in the seventeenth century, which is the first century when its independent practice is common, seems as if its masters knew how to play only one tune each. In Naples it is an embittered scapegrace who has an eye for tortured rocks and shattered trees, the haunt of brigands and the outcast, and who rings the changes upon such scenes fiercely and impressively enough, if with too little regard for sober fact and nature. There he is (131)—a perfectly characteristic and vigorous Salvator from the collection of Lord Yarborough. The foliage, it is true, is more like seaweed than leaves, and the umbered glow which takes you is chiefly the result of age and varnish. At Rome we have two Frenchmen, Claude and Gaspar, who have taken up each in his way the classic spirit of the place. Claude loves misty light, the glow of afternoon, the poetry of decay, the sun of the Campagna setting behind distant lines of aqueduct, great trees that wave above embosomed temples, goats that dance among fallen plinths and capitals; or else he dreams of the statued wharves and columned warehouses of some merchant city of the old Mediterranean, and loads the gilded ripples of its haven with the hulks of impossible galleys. And Claude is here: one example of him especially which is among the finest and most glowing. I mean *Crossing the Ford* from Leigh Court. And here are three Gaspars, in his sterner and more pompous mood of the classical. In both of these there is poetry, a partial poetry, and of the mood which belongs to seasons of decadence and regret. We go north, and find in Flanders a poet of a ruder mettle. Rubens's landscapes, the best of them, seem to me among his very finest work. Give him his point of view—that the country is a place to hunt and hawk in, or every now and then to hold a gala or a dance; and as he goes out to his hunting or hawking or dancing party, his eye will take in as few others can the sweep and undulation of the country, the rolling of the woods and of the clouds above them, the sense of light and space and colour, the harmonious trending and transition of lines between near and far. This piece of Mr. Fuller Maitland's (106) is perhaps not as fine as the famous *Rainbow*, or even as the landscape in the National Gallery; but I suppose it is certainly by his own hand, and in the silvery grey green of its colour, almost uniform but for the single spot of red among the dancers in the foreground, there is admirable originality and subtlety of effect. A little further north yet, and we lose poetry of any kind, and come to one phase or another of patient, limited, meditative prose, perfectly exact and efficient in its expression. Or, if any of the Dutchmen touch poetry, it is Hobbema with his black far-branching trees and little glades or pools beneath them full of light, and red-gabled cottages beyond the glades; or it is Cuyp, the Northern Claude, with his afternoon suns, his gold haze absorbing all distant things in its gra-

dation, his one or two strong foreground objects to relieve and give value to the rest. The Hobbemas here are not above the usual mark: but both Mr. Fordham's Oupp and Lord Yarborough's (21, 145) are among his very purest and most masterly work.

To find the whole of nature attempted in art, as not Titian himself had attempted it, we have to leap a century and a half, and to come to our own school of England. Some indeed will say it was the ruin of the greatest English landscape painter that he did attempt the whole of nature, and would not be content without dashing himself against impossibilities. But before Turner became blinded with excess of light, and turned his canvases into mere mists of yellow and scarlet in the endeavour to realise nature's full scale of illumination and colour, how many things had he not conquered from the category of the impossible. The infinite labour of his homely studies and literal transcripts in early years, the training of the English water-colourist in mere topography, had brought him, with the powers he had, to an unprecedented command of the facts and details of outdoor nature. And it was presently his conquest to paint compositions of a sovereign poetry, of a signal imaginative charm and power, and not to spoil the quality of these but to enhance it, by the fulness and multiplicity of the facts and details he knew how to put in with a science almost incredible, but with a perfect sense of mystery and subordination. Turner is well represented here with specimens of his manner in various phases. In my own judgment he is most delightful in that early specimen in which he is nearest to those of his contemporaries who sought above all things for breadth and generality, and were content with a simple range of colours. I mean the *Crichton Castle*, from the collection of Mr. Woolner (60). Nothing can be finer than the severity of the right lines of which this composition chiefly consists, with the sweep of valley and sunken river which prevents that severity from being rigid; nothing purer and more delicate than the tones of the plateau and the castle walls, nothing lovelier than the blueness of the day, in the sky, the stream which casts up the sky, and the shadowed places of the land. Look into these slopes of shadow, strong in the right foreground, fainter between the castle and the stream, and you will see almost the rich transparency of Titian, together with a delicate multiplicity that is already Turner's. No. 261, from the same collection, belongs to the opposite extreme of Turner's art, and is a dream of the unrealisable. Lord Yarborough's two great pictures, the *Vintage at Macon* (122), and the *Wreck of the Minotaur* (158), severally represent the master in a more central way. The former is one of the first results of his foreign travel: the country is not like Macon, nor the tones those of the Burgundy landscape at the golden vintage time; so far indeed from gold, there is a blackness rare with Turner, especially in the shadows. But few of his ideal landscapes are more nobly planned, or have a greater richness both in the artifices of composition and the mysteries of nature. The scene of the wreck, which has a good deal suffered, belongs to a class of his pictures of which the mind does not fail to recognise the enormous power, but from which I at least cannot receive any strong pictorial impression.

The greatness of Turner, however, is a proverb. What these exhibitions more and more bring out is the greatness of some of Turner's unconsidered contemporaries. In the first quarter of this century who would have been found—except, perhaps, Turner himself—to recognise some of the finest landscape-painting the world has ever seen in the work of an obscure group of Norfolk drawing masters, who knew of nothing except Eastern Counties' nature, and a few Ruysdaels and Hobbemas? Who would have foretold that the works which then could not find a market would now give employment to a profession of forgers and

imitators? If there were only one example of the elder Crome in existence, the picture numbered 4 in this exhibition, and lent by Mr. Fuller Maitland, that would be enough to place him beside the first names in art. The amount of pleasure which the reader gets out of this *Study of a Thistle* may serve as the measure of his appreciation for the higher qualities of painting. It is as instructive as Albert Dürer's studies of plants and dead nature. The design of the plant, with its crisp rich curves and thorny points, is splendid; its grey-green colour of an exquisite depth and silveriness which Velazquez could hardly have beaten—relieved, ever so delicately, with a brown snail-shell, a red poppy, and a spray of blue flowers upon the background. Among the half-dozen examples of Crome's familiar landscapes, Norfolk common or oak copse, I do not think any here are of his very best. I think Nos. 51 and 99 below him in their somewhat empty dash and effect and ostentatious impasto. No. 215 is not by him, as the catalogue assigns it, but by a Frenchman, Georges Michel, who like him lived unknown and is now famous. The right attribution of this piece is obvious to any one who has ever seen the work of Michel; for all his work was in the same key of brown land and white sky, with the same broad vigour and generality of effect, and the same reference to some both of his Dutch predecessors and his English contemporaries. No. 116 has a magnificent skeleton of an oak in Crome's most vigorous drawing, a luminous sky of the loveliest purity and gradation, and a lovely peep of moist field and farm; but the pond and bathers have been put in (by Stark, as I am informed, another member of the school) in a different manner, and somehow break up the effect. No. 41 has at the left extremity a vista of distance through trees which is as rich and strong and solid as any Hobbema, with a poetry in which these English distanced the Dutch; but the rest of the picture seems confused and without composition. It is Cotman, the younger companion of Crome, and a little better known than he to the London of his day, who is strongest this year. He seeks always justness and harmony of effect rather than subtlety or fulness of detail, so that his work always looks its best at first sight, and is apt a little to disappoint you on closer acquaintance. But of just and harmonious effect he is a master. Like Crome, he used his vehicles with a force and simplicity the want of which has ruined the work of more famous men, while theirs stands as on the day it was painted. Nos. 27, 32, 42, and 235 are good ordinary examples, showing Cotman's masculine and refined way of dealing with sea and cloud, whether in calm or storm. 72 and 217 are more exceptional. The first is a study of one of those vast Atlantic waves that plunge over the rocks and rush unbroken into the cave of Boscastle in Cornwall. It is a mighty piece of wave-drawing indeed; and if it is objected that the copper sun on the horizon, with its bars of copper cloud on a dull greenish sky, bears a quite false relation of light to the wave and its foam, it may be answered that the relation was never meant to be a true one, and that the sky does but serve as a note of accompaniment, a suggestion of storm and disaster appropriate to these seas that plunge about the iron coast—

"And roar rock-thwarted under bellowing caves."

No. 232 is remarkable as showing how Cotman could attempt the same thing that Turner afterwards spent his strength in attempting (but I believe Cotman was the first). In this *Castle in Normandy* he treats nature as pure colour and light, and tries to rival her. By the liquid transparency of colour, by the haze of light, by the intense harmonious blue of the water, and its reflections that redouble and prolong the buildings, by the impasto which makes the castle walls stand out solid sunshine, by the golden light in which sheep bask upon a meadow, by the vivid reds and undefined outlines of the figures in the foreground—

Cotman is here altogether Turner. He is only not Turner by the absence of Turner's sense of multiplicity, by his way of forgetting particulars more than Turner did.

If these pictures of the Norwich masters show the prodigious and classical strength of English art at the beginning of the nineteenth century in holes and corners, the Exhibition does honour to another artist, whose work shows the weakness which was impending on official English art even at this hour of its strength. That is Sir A. W. Calcott, thirteen of whose works are here collected. In the days when the water-colour painters had developed to the full the resources of that medium for luminous atmospheric effects, and when Turner was preparing for that grapple of his with the sun and atmosphere, a grapple hopeless if sublime—in those days, from what causes we cannot here enquire, it came to pass that the English school at large forgot its colour. Alike in portrait, in history and *genre*, and in landscape, there arose artists whose light was chalk and whose shadow was ink. And one of these was Calcott. All his works, as you find him represented here, are full of conscientiousness and care. He is an excellent draughtsman in landscape. He appreciates, perhaps with a little pedantry, the beauties both of English and classical scenery. He is full of accomplishment. Some of his early works in this place are admirable in composition and conduct (Nos. 14, 160); though even here that chalkiness of atmosphere and light, that inkiness of shadow, assert themselves to a threatening degree. And in later work these qualities so much gain the upper hand that it is almost impossible to take pleasure in what he does at all. How wide-spread and how fatal was this obscure malady in our school, the loss of the sense of colour, how it has helped to vitiate and vulgarise our most ambitious art through a great part of the century, we shall have occasion to see at greater length presently. SIDNEY COLVIN.

THE FLAVIAN AMPHITHEATRE.

THE interior of the Colosseum now presents such a contrast to what was there beheld in former times, that, entering these vast ruins, one receives an impression absolutely new—one in which astonishment blends with a species of awe. Instead of the wide level area, with the high wooden cross at the centre and the painted stations of the Via Crucis under the stupendous pile of encircling structures, we find a rent and disrupted level, with an excavated abyss almost semicircular opening below our feet, along about two-thirds of the elliptic space, the rest of the ground being overstrewn with huge blocks of wrought stone, shafts of large columns (white and veined marble, some being of the more precious Phrygian and Carystian kinds), and broken capitals, the Corinthian moulding of which indicates the period of decadence. Descending by a steep path formed in the clay on which the upper area extends, we reach what is evidently the lowest level—the *terra firma*—where remains much of the ancient brick pavement in the so-called hering-bone style; the area below that stage, the arena properly so-called, which, as is now made clearer than ever, must have been a boarded platform.

Here an interesting but most perplexing aggregation of antique structures, obviously of different dates and purposes, meets the eye, and invites conjecture. The upper level, on which we stand when first entering within the ruins, proves to be—namely, in the part immediately under the amphitheatric gradines and præcinctiones—that of the ancient podium, which, we now see, was supported by arcades, still extant, of massive stonework, the inner spaces of which are filled with brick that seems more modern. Within this structure, and distant from it a few feet, rise the ruins of another arcade, or rather a wall-curtain,

opening in high narrow arches, which alternate with arched windows, in two orders, on a lofty front of brickwork; this adjunct, apparently forming a second podium wider than the original one, being a confused mixture of large stone blocks and bricks, with a good deal of mortar. Within the distance of a few feet from this rises a high brick wall, built on the same elliptic plan, and within this, about equidistant, another concentric structure of similar brickwork, also elliptic so far as it can yet be seen. Within this inner circle the space is filled with clayey soil, like an alluvial deposit, at the summit of which extends what has hitherto been considered as the arena. At the southern side of the amphitheatre, where the soil has been, to a great extent, carted off, we see before us, at considerable depth, an extraordinary network of buildings, yet but partially made visible, comprising seven parallel lines of brick wall; and on the eastern side, where the *scavi* have laid a wider space open, these walls are seen to be connected by partitions, with low archways, all of similar brickwork (that, namely, of the later Roman period). These buildings resemble a cluster of small chambers, all now roofless. At the centre of the southern side of the arcades, which encircle the amphitheatre at a depth of more than twenty feet below the level, which may now be described as that of the upper storey, opens a great tunnel, or lofty vaulted corridor, built of regularly hewn travertine, which we may explore to the extent of about 300 feet. At equal distances from its mouth it is crossed by four lintels, or so-called "flat arches," examples of which are seen in the Tabularium on the Capitol, each of these before us formed of three enormous blocks (travertine), fitted together without cement. Four spacious quadrangular chambers open, two on each side, built of similar stonework, off this corridor. Exploring it farther we find that it emerges into daylight, beyond the limits of the amphitheatric buildings, and again becomes subterranean, from a point whence we may follow its course for some distance in darkness, only to be dispelled by torch or taper, till further progress is stopped by the mass of clay, not yet removed, with which the whole interior was filled. Laterally to this there are two other vaulted passages, in similar stonework, each extending for about 100 feet, and at that distance turning inwards till they adjoin the central corridor, reached by a few ruinous steps from both these dark passages, which are at a somewhat lower level. On the floor of each of these lateral corridors we see six round cavities, which have been originally lined with bronze; the same metal being beaten out, like a flattened frame, around the apertures, as seen in six among these twelve cavities, where the bronze is preserved firm and uninjured. A similar species of socket, lined with bronze, has been found near the centre of the lowest (the original) area, now partly uncovered.

Proof that the arena for gladiatorial combats, &c., was a boarded platform, not the lower *terra firma* level (which may be called in distinction the *area* of the edifice), is before us in a series of massive corbels, or stanchions, of travertine, extending, so far as yet visible, with regular intervals around the ellipse, at a depth of a few feet below the ground where the Via Crucis devotions have hitherto been celebrated. What could these have served for but the support of a moveable stage, such as is clearly implied in the words of classical authors? Herodian tells us that when Commodus slew 100 lions in this amphitheatre, these animals sprang up from a lower storey:—"The lions which Commodus killed sprang from the subterranean places of (or under) the arena." The poet of a later age, Calpurnius, describes that arena, in the entertainments given by the Emperor Carinus, as opening in the midst, and the wild beasts rushing out of cavities like the trap-doors (as we may suppose) of modern theatres: "*Ruptaque voragine terræ emersisse*

feras." Among remnants of art-works discovered in the long-buried ruins are some male torsos, Corinthian capitals rudely chiselled, and broken columns; also, more noticeable, several marble slabs, probably for wall-incrustation, on which are rudely traced *graffiti* of gladiators in combat, or in repose after such services, one with the palm of victory in his hand, others with crowns set beside them, and with names below. One *graffito* represents a hare, with a larger animal, like a tiger, probably one of those exhibitions of wild and tame beasts trained for certain feats which Martial mentions in his "*De Spectaculis*."

To explain the purpose and origin of the structures recently brought to light, at a depth below the other buildings, would be difficult, and, in the present stage of the *scavi* at the great amphitheatre, premature. Two epigraphs or tablets, still left where they have long been seen on the upper area, record restorations of the podium, the arena, and in one instance the arcades for entrance and gradines (*portis positio . . . et spectaculi gradibus*) by urban prefects, in the years 439 and 486. In the sixth century the chase and slaughter of wild animals was an entertainment still kept up, being twice displayed under the reign of Theodoric, in the Flavian edifice. In the twelfth century the "*Colosseum*" (a term used, as we may infer, since the eighth century) was fortified and held as a principal stronghold by the Frangipani family, from whom Frederick II. took it, for transfer by act of Imperial authority to the Annibaldi, another baronial house conspicuous in mediæval Rome. In the fourteenth century the Emperor Henry VII. deprived the latter of this unique fortress, and handed it over to the Roman Senate, which became thenceforth lawful owner of these vast and probably now much transformed buildings. In the year 1332 a grand bull-fight was given in the amphitheatric arena, for which occasion new gradines were erected around the antique præcinctiones. That proved a day of fatal pageantry, for many Roman youths of noble families who took part in the combats succumbed in the dangerous sport, commenced with pomp and gaiety. Many were left dead, several others stretched in their blood, after being seriously wounded, amidst the scene destined for festivities—as described by the chronicler and contemporary Monaldeschi, in Muratori, *Rer. Ital. Script.* In the pages of mediæval records, or in those of the earlier vicissitudes through which the Colosseum passed between the fifth and fourteenth centuries, we should, I conclude, seek for a key to the mystery before us, and so much that seems at first unintelligible and inexplicable in the recent discoveries. We may suppose that, as the exhibitions on its ancient arena became less atrocious and sanguinary, after human life at least had ceased to be sacrificed for barbarous sports, and the hired gladiator was no more "butchered to make a Roman holiday," those displays became also less splendid and on a minor scale. The *naumachiae*, for which, no doubt, the brick pavement under the wooden arena was flooded, were probably discontinued from a period long before the fall of the Empire. For the spectacular chase, or slaughter of wild animals, a narrower locality may have been deemed sufficient; and hence, we may infer, was adopted the expedient of so curiously filling up with later and quite unsymmetrical buildings the great elliptic area now gradually opening before us in the result of the still progressing works that are revealing its long-concealed depths; hence the curious system of concentric structures, circle within circle, irregular arcades within the more scientifically planned and earlier architecture below the podium—an arrangement so contrary to all principles of harmony and to all proprieties observed in classic monuments, yet adding a new and mind-awakening interest to the attractions already felt for ages in the marvels of Rome's Colosseum.

C. I. HEMANS.

NOTES AND NEWS.

MESSES. PILGERAM AND LEFEVRE's new print, which is just out, is one of the most effective pieces of engraving we have seen for some time. The subject is Erskine Nicol's old Highland fisher and his boy, exhibited in the Royal Academy two years ago. The salmon-trout is hooked, and the perilous moment of landing it has arrived, when the old and experienced old man calls to the excited boy who holds the rod, "*Steady, Johnnie, steady!*" which gives the picture its name. Mr. W. H. Stannard has employed all the various methods to give variety and richness of tone to the work, and has succeeded admirably.

ONE of the many interesting buildings of old Bruges, the Hôtel of the Guild of Crossbowmen of St. George, is about to be destroyed to make way for a normal school to be erected on its site. This is an inexcusable act of vandalism, as the fine old red-brick tower, with its vaulted staircase, dating from the beginning of the sixteenth century, might easily have been preserved and made a work in with the new buildings, if these were planned in the same style, a most suitable one for school buildings. Our Charles II. became a member of this Guild in 1656, and used to amuse himself by shooting in its garden; a painting commemorative of a festival given in his honour on the 11th of June, 1656, formerly in the hall of the Guild, represents Charles suspending the golden bird to the neck of the victor in a trial of skill. The last remains of the Hôtel of St. Barbara, in the same street, built by a fraternity of musicians, of which Charles was also a member, will probably be swept away ere long, this property having been acquired by the late Sir John Sutton, with the view of incorporating it into the grounds of the English Seminary founded by him, and for the permanent establishment of which he had purchased the adjoining convent of the Carmelites of Sion. The last months of his life were spent in superintending the restoration and enlargement of the church and adjoining buildings.

THE Danish painter, Professor Daniel Hennrich Anton Melbye, died at Paris on the 10th inst. He was the most successful artist that Scandinavia has produced since Thorwaldsen, and by sheer good fortune had risen to be the most fashionable sea-painter in Europe. Almost ignored in earlier art-circles, he enjoyed boundless popularity, especially in France, among the wealthy and discerning furnishers of great houses. It was strange that he should become the darling of the *parvenu*, since his personal character was full of eccentricity and waywardness, and his life marked by the most daring acts of adventure. He was born at Copenhagen in 1818, and began life in very poor circumstances as a ship-builder's apprentice. Tiring of this, he took up music as a profession, and tried as well as he could to subsist as a troubadour. This was enjoyable enough as long as food could be got by it, but at last poverty obliged him to look elsewhere for a livelihood. The sudden wish to be a sea-painter drove him to the studio of Eckersberg, then in the height of his fame. The old master encouraged and helped him, and in 1840 he exhibited his first three pictures at Charlottenborg. These had the good fortune to attract Baron Rumohr's attention, who introduced the young painter to Frederick VI. Melbye's fortune was made: he was sent in the royal corvette *Flora* to paint in the Baltic, and next to Morocco, where he took part in the bombardment of Tangier, and was nearly killed. In 1847, having gained all the honours Denmark could give him, he settled in Paris. Almost immediately he became introduced to Louis Philippe, who took him under his special patronage. But in a few months the patron himself was not. Still Melbye succeeded if all others failed: this was his life's fortune; and in 1853 he travelled with the French Embassy to the East, lived nine months in Constantinople, and painted sea-pieces

for a new patron, the Sultan himself. Then, returning to Paris, Napoleon and his Empress patronised the fashionable Dane; and the latter would have taken lessons of him in drawing if the reckless Mæbye had not three consecutive times failed to come at her appointment. In 1858 he came once more to Denmark, and then returned to Paris to settle till his death. A strong sense of beauty, a powerful and eccentric fancy, and an almost incredible fertility of invention, raise him distinctly above the rank of a mere spoilt child of fortune.

THE late Senator Sumner had an enviable reputation, with a part of the public at least, as a collector and judge of pictures. At the time of his death there was considerable speculation as to what would be the disposition of his many valuable works of art. His will soon settled all doubts upon the subject by naming the Boston Art Museum as the heir of the entire collection. The will directed that the pictures were to be kept or disposed of as deemed best by the trustees. That the pictures were not all that their late owner and his friends believed them to be, is proved by the fact that the trustees did not receive them at the Museum at all, and finally put them up for sale by public auction, only reserving a few engraved portraits of distinguished men. The rest of the collection was sold two or three weeks ago for a mere song. A small photograph of Lord Stanhope with his note of presentation brought 3.25 dollars, and a little coloured print endorsed by Mr. Sumner as presented to him by Lord Brougham sold for 29 dollars. After a few engravings had been disposed of at low figures, the paintings were offered. These paintings were attributed to the old masters by their late owner, and believed by him to be genuine. That either they were not genuine, or that the trustees of the Art Museum were greatly deceived, is shown by the prices they brought. A picture signed Rembrandt sold for 70 dollars, and a landscape signed Salvator Rosa sold for 20 dollars, and the bidding was very dull. Senator Sumner told an artist of our correspondent's acquaintance that he bought his Salvator Rosa for 700 dollars, and his Rembrandt for 500 dollars, of a Paris picture dealer. The senator must have been strangely ignorant of pictures or of picture dealers to imagine for a moment that he was getting originals at such prices. In a note to the catalogue of the sale the trustees of the Art Museum declined to attribute these pictures to the famous masters whose names they bore.

WE mentioned some months ago the charge brought against M. Vérestchaguine by a brother painter of appropriating other men's labours. The matter has just been carefully investigated by the Munich Society of Artists, and they have delivered a unanimous verdict that the accusation is entirely unfounded.

THE death of the Alsatian painter, Félix Haffner, is announced.

VISITORS to the last Salon at Paris will recall a plaster statue of the engraver Callot by M. Laurent. He is represented with his pencil in one hand and his sketch-book in the other. It is now proposed to have it cast in bronze, and placed in one of the squares at Nancy. The order has been given to M. Barbedienne, but funds are wanting to have the statue executed, and a subscription list is opened for the purpose.

AN interesting discovery has been made at Rome, by the Commendatore de Rossi, at the basilica of St. Petronilla. Pursuing his excavations behind the apse, he came upon a fresco painting representing the saint visiting a celebrated matron, St. Veneranda, who had desired to be buried near her tomb.

M. VIOLLET-LE-DUC, the eminent architect, has been elected to preside over the Commission officially appointed to superintend the public works of Paris for the ensuing year. His connexion with the ecclesiastical authorities of the

French capital, under whom he held a similarly responsible post, is said to have been severed in consequence of his adhesion to the Protestant faith, and his liberal views in regard to politics.

A CURIOUS sale took place on the 12th at Messrs. Puttick and Simpson's of a series of the auction catalogues of Messrs. Southgate and Co. from 1825 to 1868, with the prices and names of the purchasers. They consist of 231 volumes, and are valuable for reference on matters connected with literature and art. They appear to be in very bad condition, and were sold to Mr. Wilson, of King William Street, for the small sum of 27l.

THE *France* announces that the Prussian government has purchased for 100,000 thalers the large collection of medals of Count Prokesch, of Vienna, celebrated in the numismatic world for its richness, especially in the coins of ancient Greece.

THE sale of the first series of works of art eliminated from the Musée Carnavalet ended on the 15th, consisting of faience, jewellery, sculpture, metal work, &c., and realised 22,900 francs. The second portion, comprising furniture of the Louis XIV. and Louis XV. periods, will be sold this week.

THE January number of the *Picture Gallery* is devoted to Sir Joshua Reynolds, and contains permanent photographs from four of his most celebrated works. We are told that this cheap and well-got-up publication is so much appreciated by the artisan classes in the North of England, that there is quite a rush for it on the day that it arrives in one or two of the principal manufacturing towns. The publishers, Messrs. Sampson Low and Co., propose this year to give short biographies of all our best English artists, illustrated by photographs from their most important works. Such an undertaking merits recognition, for it popularises art without degrading it.

THE *Gazette des Beaux-Arts* contains more interesting matter this month than it has done for some time, though it is still somewhat deficient in original information. As a first article, we have a new translation of fifteen of Michelangelo's sonnets by M. Saint-Cyr de Rayssac, who enters also upon the subject of the great artist's relations with Vittoria Colonna, writing as if there were no possible doubt as to the sonnets having been addressed to her, or of the poet's overwhelming passion for this celebrated beauty, whereas authorities differ considerably on both these points. No doubt the publication of the Buonarroti correspondence will throw some light on this vexed question. It may be presumed that some of the 1,400 letters addressed to Michelangelo are from the beautiful and noble Marchesa. A photograph from the master's drawing of her in the Uffizi illustrates the article.

"Murillo and his Pupils," by Paul Lefort, forms the subject of the second article. It does not contain any new facts relating to Murillo, and his pupils are not as yet mentioned; but they will come, no doubt, in a future number, for the article is to be continued. Any information regarding them will be welcome, for very little is known as to them or their works. The *Death of St. Clara*, belonging to Lord Dudley, previously mentioned in the note on the Salamanca collection, and the *Louvre Cuisins des Anges* are given in wood engraving. A history and description of the ancient château of Anet, once the residence of the superb Diana of Poitiers, which has lately been restored with great artistic skill by M. F. Moreau; a continuation of A. Jacquemart's review of the Union Centrale, dealing with the Oriental costumes; the Exhibition at Lille, also a continuation; an interesting and valuable account of the ivory carvings of François Duquesnoy or François Flamand, a Flemish artist who worked in Italy at the beginning of the seventeenth century; reviews of Lacroix's *Dix-huitième Siècle* and Des-

jardin's *Drappeaux français* fill up the number, which contains, moreover, a vigorous etching, by Waltner, of Rubens's magnificent portrait of the Baron van Vick, acquired at the sale of the King of Holland by the Louvre.

THE STAGE.

THE NEW PLAY AT THE VAUDEVILLE.

Success, like Property, has its duties as well as its rights, and from a new comedy at the Vaudeville great things may be expected. For nearly five years the theatre has been open with only the shortest of vacations, and during all that time few of us have known what it is to spend a dull evening there. I don't know whether the managers are very keen themselves, or whether it is that they are uncommonly well advised; but this at least is certain, that they have hardly taken a step which the better part of the public has had any cause to regret. Some people like their burlesques; others only forgive them in virtue of their comedies. Their comedies every one has liked. They have played the most brilliant comedy of the last, nay, perhaps of any century, with a completeness which in these days of "starring" and dispersion seemed a lost art. They have played half-a-dozen other old pieces nearly as well. They have produced some good things, and nothing very bad. They have had the singular good fortune, or singular insight—for I don't know which it is—to gather about them actors and actresses sure of a future. Irving himself won his first fame at their theatre, and it would take some time to count the minor "hits" made now by Mr. Farren, now by Miss Fawcitt, now by Miss Roselle, now by Mr. Righton—not to speak of the growing power of Mr. James and Mr. Thorne, neither of whom is ill-advised in gradually leaving burlesque for genuine comedy. So that there is established at the Vaudeville a tradition of success. One goes to the place expecting a good thing. This time, with *Our Boys*, one does not come away quite as well satisfied as heretofore.

But, since *Our Boys* is Mr. Byron's, it is of course amusing. It is even more—it is vigorous and fresh; but it is terribly incomplete. And here, that the reader may judge for himself, we will put down what we remember of the story.

Mr. Perkyn Middlewick was a buttermilk in Lambeth, with a good head, a good heart, and no education. Being now wealthy, he has abandoned business, but the shop is still upon him—for "a buttermilk," says Mr. Byron, "can never retire." Not being himself of this opinion, Mr. Middlewick has bought a country house, and it is there that the action of the play begins, when his son is momentarily expected to return from the grand tour. He is not alone in his house, for as it is on the way between the station and Champneys Hall, Sir Geoffry Champneys has made it (for the convenience of Mr. Byron) the place where he will welcome the return of his son Talbot, who comes back from his travels with his friend the buttermilk's son. A foreign *table-d'hôte* makes us equals for dinner-time, and dinner-time, in the case of Talbot and Charles, has been unusually prolonged. With Sir Geoffry there lives his sister, and there stay just now two pleasant guests—young women—and the whole party has come down to the retired buttermilk's to await the traveller's return. "Our boys" come back. Talbot Champneys saw nothing particular abroad, and has nothing worth saying to say, and the audience imagines that it is his father's fondness that sees in this future member for the county a striking likeness to Pitt. Charles is a finer fellow: pained a little at the buttermilk's too obvious lack of learning, but proud, after all, of his energy, his success, his affection. The two young women make their appearance. The boys have met them abroad, and have said sentimental things to them in the lamp-lit gardens of Hombourg or Baden.

The sentimental things have been remembered. Love has begun.

But then love—following its usual course—has begun in the wrong way. Violet Melrose is an heiress, and the baronet had mentally appropriated her for his son. Unhappily it is the son of the butterman who has wooed her successfully under the influence of those lamp-lit gardens and the quiet night at Hombourg; and the sprightly cousin—clever and poor—who would have done very well for the younger Middlewick, has made her mark on the honest heart and dull head of the baronet's heir. Not that things have gone very far between them as yet: Charles Middlewick and Violet are more deeply committed. But the butterman is grieved that his son should ally himself with a woman whose alliance must separate him from his father—he has observed already her sudden involuntary disgust at the rough gesture, bad manner, and bad English—and the baronet is enraged that his son, who should take a wife from his father's hands as he takes his politics or his estate, should be making love to a witty sort of girl, who instead of being an heiress is only an heiress's cousin.

Open war has not broken out when the second act begins. People are still civil, if cold; and the butterman and his son have been asked to dinner with the party at the older house. Here the crisis arises, for the baronet overhears his son make a proposal to Mary, which is none the less serious because it is comic too. Sir Geoffrey does not restrain his anger: he taunts and threatens to no purpose, and the curtain falls on the spectacle of two disinherited sons—Talbot vowing that he will earn his living along with his friend Charles Middlewick, who will defy his father's prohibition to marry the heiress, but will not marry her so long as the father's anger would leave him quite dependent on her wealth. "Our boys" bid quick good-bye to the fathers who have disinherited them, and to the girls of whom they have yet to prove themselves worthy. The boys leave Champneys Hall, and go out into the world together—by the parliamentary train.

Going out into the world, to earn a living in it, on the strength of a little amateur's ability shown in literature, and the shallow experiences of the grand tour, ends in the third act just where we may expect it to end—in the "third floor back" of a very poor lodging-house, where the weekly rent-day is an occasion of only too keen excitement to a landlady who knows that her lodgers are poor. In this room Talbot Champneys is entrusted by a bookseller with the compiling of an article on Mesopotamia for a new Gazetteer, while Charles Middlewick having submitted to a publisher those poems of youth inspired by the starlight and society of Hombourg, receives a letter informing him that poetry is a drug in the market. Ill and disheartened, the young men leave their room on some errand in the town. It is the Cattle Show week, and their fathers, yearning to forgive them, have seized the occasion to visit their rooms. Sir Geoffrey is chiefly struck, when, under the guidance of the maid of all work, he penetrates to their deserted apartments, with the poverty and wretchedness of the lodging; but the butterman, who began life humbly himself, makes himself quite at home in the dilapidated arm-chair, and is chiefly dismayed by the quality of the provisions—the breakfast eggs never knew an English dairy, and the butter is from Dorsetshire. For flesh and blood this is too much—a room with peeling wall-paper for Sir Geoffrey's son; a breakfast with second rate food for the son of a wealthy tradesman: these are calamities to be set right at any cost. The boys must be forgiven. The young women appear upon the scene, and there is a brief misunderstanding, caused by the visit of a lady who turns out to be Talbot's aunt. She had come with the best intentions in the world, and when her identity is established, there is nothing more to discuss; for, by this time, the fathers are weary of opposing the marriages they

did not plan; and as the sympathy of play-goers is on the side of youth and its illusions, everyone is contented when the curtain falls.

Such a slight story could never hold the attention of an audience during a couple of hours, if it were relieved by no display of character and enlivened by no sallies of wit. Mr. Byron is always able to command laughter easily: throughout the whole performance of his piece there is always someone laughing: now it is at a pun, now at an impertinence, now at a queer conjunction of words without meaning, now at a happy smartness, now at fun of a higher level, when the old smartness rises and kindles into brilliancy, to show us how well Mr. Byron might do if he chose. The piece is full of the dialogue of rattling farce; here and again broken in upon by the dialogue of pure comedy—stray contributions towards a literature that might live. The best lines in the piece, and the best delivered too, are those spoken between Miss Roselle and Mr. Thorne, when Talbot Champneys is proposing to the witty and penniless heroine. Mr. Thorne's half unconscious manner is known to be excellent, and it contrasts admirably with the not less excellent manner of Miss Roselle, who nurses, so to say, each humorous phrase, with evident intention to make the very most of it. Many actresses fall as the dialogue rises; but the sharper the repartee, the more pointed the talk, the better gets the acting of Miss Roselle, from whose various gifts for the playing of comedy the stage has much to hope.

If the best scene be this of the proposal made by Talbot Champneys to Mary Melrose, the best character is that of the retired tradesman, and this character—vulgar on the outside only and very sterling and sympathetic within—Mr. James plays with a force and truth which surprises no one who saw him in the last comedy of Mr. Boucicault's played at the Vaudeville. The self-satisfaction of new wealth; the pride, half-good, half-bad; the delight in a son who has gentler manners than his own; the obstinacy, which in another man we might call determination; the final victory of a tender heart, guided though it be by chiefly animal instincts—all these things are marked observantly, by Mr. Byron, to begin with, and then, very excellently, by Mr. James. Mr. Thorne, as I have indicated above, has many excellent moments, but this time his impersonation is denied the virtue of consistency; at least it is difficult to conceive that the lazy and unobservant tourist of the first act should develop into the shrewd hero of the third. No other leading character has much individuality. Sir Geoffrey Champneys is a man you have met before, but Mr. Farren represents him so that it would not be a misfortune if you met him again. Mr. Charles Warner is once more the manly lover of *Two Roses*: now with no opportunity for special distinction. The young woman with money is played by Miss Kate Bishop; Miss Larkin makes nothing very new out of the part of Sir Geoffrey's sister. The one new thing—the thing we didn't know before—is that the Vaudeville has one more good actress in Miss Cicely Richards, whose parts hitherto have been insignificant, and whose part in *Our Boys* is chiefly remarkable by what she makes it. Not but that any experienced actor, listening to the reading of the piece, would have noticed that upon the character of this lodging-house maid of all work—fit companion for Bob Sawyer's servant, whom Dickens painted for us on his platform, inimitably by one dull stare—Mr. Byron has bestowed observation and care. The part from the first undoubtedly was capable of stage effect; but many persons, acting it, would have made it purely conventional. Miss Richards, on the other hand, has given us a type, never exaggerated, never merely farcical: but a new true thing on the stage. The addition to one's list of living people, not lay figures, on the stage, is not indeed of supreme value; but such as it is, we will give it welcome.

FREDERICK WEDMORE.

La Perichôle is the piece with which Miss Dolaro will open the Royalty Theatre, this day week, we believe.

THE *Lady of Lyons* was found so attractive on two mornings at the Gaiety, that Mr. Hollingshead was emboldened to take the Opera Comique for a little while; and there Mr. and Mrs. Kendal, as Claude Melnotte and Pauline, are repeating the performances which made the Gaiety so attractive. Mr. Ryder has wisely been engaged to strengthen the cast, in a part for which he is specially suited, and Mrs. Buckingham White also appears, so that the piece is well acted all round, and excellently as far as Mrs. Kendal is concerned in it.

MRS. CHIPPENDALE'S illness has caused the postponement at the Court Theatre of a long and repeatedly-announced comedietta—*Maggie's Situation*.

Two revivals, promising a certain amount of interest, are announced at the Haymarket, for Saturday next, the 30th, by which time it is to be hoped that the now hardly tolerable farce of Lord Dundreary may be permanently laid upon the shelf. The revival of *Home*—the only successful piece which the late Mr. Robertson wrote for a theatre other than the Prince of Wales's—is not held to be enough to compensate for the withdrawal of Dundreary, so an exceedingly effective comedy, *The Serious Family*, will be revived on the same night. The change may not be an absolutely satisfactory one, but at all events it will be a change for the better.

THE *Beggar's Opera* now precedes *Madame Angot* at the Holborn Amphitheatre, and the Philharmonic continues to represent the most popular production of Lecocq.

A LONG article from the *Kölnische Zeitung*, to which the *Times* gave publicity on Monday, gives us an opportunity of seeing what a German critic thinks of the Hamlet of Mr. Irving. The German critic does not think anything very well worth reporting, though it is satisfactory to know that his opinion is at least on the right side. Having followed the great English actor over the track of his performance, the German critic ends where others have ended, with unstinted praise of the fencing scene. Isn't all this a little superfluous, when you have discussed a performance confessedly unique in our day. Mr. Irving fences well—be it so—but the ecstasies are a little misplaced. Well as he fences, your fencing master will fence still better; but your fencing master cannot act Hamlet, and that is what Mr. Irving can do, and what you go to see.

THE death of Grenier, the French comedian, is announced. He was only forty-two years old. He first played the part of the blatant agitator in M. Sardou's *Rabagas*—played in London, it will be remembered, by the elder Berton, who died not long afterwards.

MDLLE. PRIOLEAU, a young actress known on the stage as Mdle. Juliette, of the Gymnase Theatre, died a few days since, of typhoid fever.

A NEW piece was to be given at the Gymnase on Tuesday; the chief parts being played by Mdle. Blanche Pierson and Mdle. Tallandiera. The author is M. Louis Denayrouze, whose one-act piece at the Français, *La Belle Paule*, owed everything to the art of Mdle. Sarah Bernhardt.

In the *Temps*, Sarcey is reduced to speak of deceased actors and old pieces, about neither of which does he find it easy to be either brilliant or profound. His tribute to Grenier is, however, sympathetic. Grenier's first great part, says M. Sarcey, was in Lambert Thiboust's comedy, *L'Homme n'est pas parfait*; his best part that of Rabagas, in which the French critic has thus written of him: "Sardou, en le choisissant, avait eu le coup d'œil juste. Le visage et les allures de Grenier convenaient assez au héros que l'auteur s'était proposé de peindre. Il avait le comique

froid, gros et violent; c'étaient justement l'affaire. Il n'y avait qu'à lui recommander de presser un peu les mouvements, d'être bruyant et tumultueux. . . . Peu à peu il s'établit confortablement dans ce personnage, qui a été sa dernière et sa meilleure création." And most men know who it was that Sardou desired to paint in Rabagas.

A FRENCH journalist gives an amusing account of the scene at the author's "reading" of a play in the different Paris theatres. At the Odéon, there are three ways of hearing a play read. There is the way in which they hear Georges Sand, always with murmurs of joy and exclamations of enthusiastic admiration, inspired not only by present merit, but by memories of *Le Marquis de Villemer*. There is the way in which an everyday prose author is listened to, with calm encouragement as he reads: only at the end somebody suggests that the play would be good if the first act were altered, and somebody else that it would do if the end were changed, and somebody else that it might succeed if the middle act were wholly omitted. The third way is the way in which a young poet of modern Parnassus is received. This time the actors are no longer artists and critics, but so many fathers and mothers and brothers who press round the young man with affectionate praise. He goes away convinced that Victor Hugo's reign is over. At the Palais Royal, the wittiest writer has never been able to make the players smile. They are all determined to show that every piece owes everything to their acting, and that without their funniness it would be dull stuff. At the Variétés, the leading actor, Dupuis, sits near the door at every reading, and if the piece is good he congratulates the author when it is finished; but if it is bad, he glides away just before it closes, and his absence is rightly interpreted by his brethren to mean that the piece must be condemned. At the Gymnase, things, if not simpler, are more methodically regulated. Every member of the company keeps his eye on M. Derval, who keeps his eye on M. Montigny—the most critical of all the managers in Paris. If M. Montigny smiles, M. Derval smiles, and seeing M. Derval smile, everyone smiles. But if M. Montigny sheds a tear, M. Derval sheds a tear, and seeing M. Derval shedding a tear, everyone weeps copiously. Thus at the Gymnase, the verdict is sure to be unanimous. Happily, it is generally just.

MUSIC.

At last Saturday's concert at the Crystal Palace, a composition by Rubinstein was brought forward for the first time in this country. This was the overture to his opera *Dimitri Donaskoi*. Though new here, the overture is by no means a recent work of its composer, having been written, on the authority of the programme, in the year 1849. Probably no more unequal composer than Rubinstein exists. In his larger works especially it is always uncertain whether or not he will be successful. The present overture is in all respects one of the best and most interesting pieces from his pen which has yet been produced here. Those who had heard his *Don Quixote*, his piano quintet, or his Fantasia for two pianos, must have been agreeably surprised at the flow of melody, the perfect clearness of form, and the absence of diffuseness which distinguish the overture to *Dimitri Donaskoi*. Another special feature of Saturday's concert was the very fine performance by Mr. Oscar Beringer of Schumann's charming piano concerto. Mr. Beringer, who has on several previous occasions been heard at these concerts, is a pupil of the late Carl Tausig. His playing last week was characterised not merely by faultless technique, but by much taste, and the absence of the slightest tinge of that exaggeration which some people seem to consider inseparable from what is known as the "higher development." At the close of the work he was warmly and de-

servedly applauded. The symphony was Beethoven's No. 7, and the opening overture Mendelssohn's *Wedding of Camacho*, familiar to the frequenters of the Crystal Palace by previous performances. A special word of praise should be given to the vocalists, Miss Sophie Löwe and Mr. Edward Lloyd, for their tasteful selections. There were neither the hackneyed Italian songs nor the trashy ballads by which the programmes of these otherwise excellent concerts are sometimes disfigured. Miss Löwe sang a scena from Spohr's *Jessonda*, and songs by Rubinstein, Schubert, and Brahms; and Mr. Lloyd was heard in "Oh, 'tis a glorious sight," from *Oberon*, and two songs by Schubert. To-day Herr Wilhelmj is to make his first appearance at the Palace since 1866.

LAST Monday's being the 500th of the Monday Popular Concerts, it was a happy idea of Mr. Chappell's to repeat the exact programme of the first concert, which took place on February 14, 1859. It is very seldom that a musical institution can announce a 500th concert; it is even seldomer that in such a case three of the performers shall be the same on both occasions. Yet such was the case on Monday night. Sir Julius Benedict, Herr Louis Ries and Signor Piatti, who took part in the performance, have been associated with the Monday Popular Concerts ever since their commencement. The programme was entirely selected from the works of Mendelssohn, and it is a curious thing that while the opening piece, the Quintet in B flat, had been performed seventeen times previously, the following instrumental piece, the Sonata in F minor for piano and violin, had, until last Monday, never been repeated since the night on which the concerts commenced. The remaining pieces in the programme are so well known that a mere record of them will suffice. They were the variations for pianoforte and violoncello in D, and the stringed quartet in the same key, Op. 44, No. 1. M^{me}. Norman-Néruda was the leader, the violas being played by Messrs. Straus and Zerbini; while the pianist was Miss Agnes Zimmermann, whose merits are so universally acknowledged that it is needless to say a word about them.

THE last number of the *Revue et Gazette Musicale*, in reporting the recent performance of the *Messiah* in Paris, under M. Lamoureux, speaks in the highest terms of the voice and singing of M^{me}. Patey, who was specially engaged for the concert. It must have seemed strange to that lady to sing the familiar music with a French text—to find, for instance, the air "He was depised" set as "Comblé d'outrages."

MDME. ESSIPPOFF is at present at Paris, and was announced last Sunday to play Chopin's concerto in E minor at M. Pasdeloup's popular concert.

M. SAINT-SAËNS, the talented French composer, has just completed an opera, the libretto by M. Louis Gallet, entitled *Etienne Marcel*.

THE last number of the *Neue Zeitschrift für Musik* furnishes a notice from the pen of the able critic Herr A. Maczewski of Götz's new opera *Der Widerspänstigen Zähmung* (*The Taming of the Shrew*), produced last October at Mannheim. The critic speaks of it on the whole in highly favourable terms.

A GRAND musical festival is to take place at Cincinnati (U.S.) on May 11, 12, 13, and 14 under the direction of Theodore Thomas. Among the works already announced are Brahms's "Triumphlied," Beethoven's Symphony in A, Liszt's music to *Prometheus*, Mendelssohn's *Elijah*, Bach's "Magnificat," Beethoven's Choral Symphony, Schubert's Symphony in C, and scenes from *Lohengrin*.

At the Royal Albert Hall Concerts *Israel in Egypt* will be performed on Tuesday the 26th inst. The solo parts will be sung by M^{lle}. Johanna Levier, Miss Katharine Poyntz, Miss Antoinette Sterling, Signor Fabini, and Mr. Sims Reeves,

"The Lord is a man of war" being sung by the male voices of the Royal Albert Hall Choral Society—an alteration of the composer's intentions which it is difficult to justify. The band, which has been considerably strengthened by the engagement of many of the best instrumentalists, will number over 100 performers. A very interesting feature at this concert will be the appearance of M. Guilmant (the celebrated organist of La Trinité, Paris), who is to play Bach's Toccata and Fugue in D minor before the oratorio, and between the parts "Improvisation sur des Motifs de Handel." The oratorio will be conducted as usual by Mr. Barnby.

FROM Baden is announced the death, at the age of eighty-seven years, of Johann Peter Pixis, the once famous pianist. For many years he had retired from the exercise of his professional duties.

A NEW opera, *Lenore*, by Dr. Otto Bach, director of the Mozarteum at Salzburg, has been produced at Coburg with great success. The libretto is founded on Bürger's well-known ballad.

POSTSCRIPT.

It is reported from Brussels that M. Jean Baptiste Julien d'Omalus d'Hallo, one of the most distinguished men of science in Belgium, died on Friday, the 15th instant. Born at Liège, on February 16, 1783, he had nearly reached the age of ninety-two years. Although an active politician, M. d'Omalus was an enthusiastic geologist; and many of his scientific works, such as the *Précis Élémentaire de Géologie* and the *Abrégé de Géologie*, acquired an extensive reputation. The Royal Society's Catalogue gives a list of upwards of forty original papers, chiefly on geology and mineralogy, which proceeded from his pen between the years 1807 and 1863. Nor should his ethnological labours be forgotten; not only was he author of a valuable work entitled *Des Races Humaines, ou Éléments d'Ethnographie*, but it will be remembered that he presided over the International Congress of Prehistoric Archaeology held at Brussels in 1872. M. d'Omalus was the oldest member of the Belgian Senate; and among his scientific honours we may remark that he was a member of the Belgian Royal Academy, a corresponding member of the French Academy of Sciences, a member of the Geological Society of France, and a foreign member of the Geological Society of London, having been elected so far back as 1829.

ROYAL GEOGRAPHICAL SOCIETY.

THE CAMERON EXPEDITION FUND.

1 SAVILE ROW, LONDON, W., January 4, 1875.

LIEUTENANT VERNEY L. CAMERON, R.N., Leader of the Livingstone East Coast Aid Expedition, under the direction of the Royal Geographical Society, has, since the attainment of the primary object of his journey, surveyed the unexplored portion of Lake Tanganyika, and he reports that he has discovered the outlet of that great reservoir. He is now attempting to reach the Atlantic coast by following the course of Dr. Livingstone's Lualaba, which he believes to be the Congo; a perilous, arduous, and most expensive enterprise. It has been determined by the Council of the Royal Geographical Society to appeal to the Fellows and the Public for Subscriptions to meet the considerable expense of so great an undertaking.

Subscriptions will be received for the "CAMERON EXPEDITION FUND" by Messrs. RANSOM, BOUVERIE & Co., 1 Pall Mall East; Messrs. COCKS, BIDDULPH & Co., 43 Charing Cross; and at the Rooms of the Royal Geographical Society, 1 Savile Row, W.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Recollections and Suggestions, 1813—1873.

By John Earl Russell. (London: Longmans & Co., 1875.)

(First Notice.)

It is not the habit of English public men to contribute much to the history of their times. To do this requires a literary taste and aptitude in which many of our most distinguished politicians have been singularly deficient, and something of a philosophic mind which is always rare in that condition of existence. Even where skill and inclination are not wanting, there is yet a serious obstacle to any such performance in the customary reticence which our rulers observe, in curious contrast to the conversational readiness, and even garrulity, of many remarkable continental statesmen; and which they regard as their best defence against the intrusive curiosity of society and the press, and the general publicity of English life. The intellectual character and political career of Lord Russell are, in many points, exceptional, and tend to obviate these difficulties. He was a writer from his earlier youth, and though he cannot be said to have any stable place in English literature, it is something to have tried his abilities as a dramatist, essayist, and historian. Born in the purple of political life, he came into the House of Commons before his majority, by an illegal immunity which was not uncommon in those days of privilege, and of which he would have found precedents in the elections of the last Lord Fitzwilliam and the late Dr. Lushington. From that now distant date—July, 1813—to his final retirement to the Upper House, Lord Russell has never been subjected to those temptations to secrecy and evasion, those difficulties of misunderstanding and being misunderstood, those almost necessary devices of subterfuge or exaggeration, which beset the hard and narrow path of public ambition in such a country as ours, and which seem to nice and delicate minds to taint the ethics of political freedom. He is the last man not to feel the supreme advantage he has enjoyed in having been called to Parliament as to a natural position, instead of having struggled into it as a difficult profession; and if these peculiar facilities have sometimes made him practically careless of the feelings and susceptibilities of others less fortunate, they have not prevented him from exhibiting in these pages a fine appreciation of the labours and conquests even of those from whom he has materially differed in principles and in action, and have given to his judgments an air of

personal familiarity with great events that elevates even insignificant circumstances to the dignity of history.

For, in truth, in this career of an individual statesman, the two great principles of political action as exhibited in the parliamentary annals of the last fifty years are fairly brought face to face. To hold a belief in what is best for the country without reference to the opinions or feelings of the majority; to maintain these principles in evil as in good report; to watch and encourage the accessions of slow conviction and imperfect intelligence; to wait on opportunity, and to put by disappointments—this, with a short gleam of occasional success, was the usual attitude of the Whig party from the French Revolution till the Reform administration of Lord Grey; and it was in this atmosphere that Lord Russell grew to political maturity. On the other side was a party enjoying all the emoluments and dignities of office, or, to look higher, all the means of public usefulness and the exercise of national beneficence. This position was occupied and maintained by a discreet deference to the general feelings and opinions of the ruling classes of the country, and to the Crown on any questions on which the Sovereign held decided personal predilections. As long as these men believed their views to be the right ones, there may have been as much sincerity on the one side as on the other, and the only difference, so far as a representative Government was concerned, lay in the preponderance of the Conservative sentiment, and the fear of innovation. But there came an important change of relations, and one new to the parliamentary practice of the country, when, (either by external circumstances or by the gradual and, perhaps, unconscious infiltration of Liberal opinions), the application of principles that had hitherto been matters of theory assumed the character of political necessity, and the question was plainly mooted whether the change was to be made by the accession to the government of the country of those who had been the life-long representatives of those opinions, or the retention of it by old opponents prepared to acknowledge their errors, and ready to rectify them by their own tergiversation.

The student of mankind can find no more apt illustration of the working of these two methods of politics in their bearing upon the character of individual men, than the conduct of Sir Robert Peel in reference to Catholic Emancipation and Free Trade, and that of Lord John Russell in reference to Parliamentary Reform. There is no room here for any dissertation on that spirit of compromise and surrender which so distinctly animates the British Constitution; but there can be no doubt which picture is the more agreeable to contemplate. The little interest taken in the posthumous apologies of Sir Robert Peel is only thus to be accounted for, and there is also this advantage on the side of Lord Russell, that the cause of Reform implicated with itself not only the advances of civil and religious liberty, which it is the privilege of our generation to have completed, but also the very financial changes on which other reputations rest. The repeal of the Test and Corporation Acts and

Catholic Emancipation were the heralds of Parliamentary Reform, and Free Trade was its inevitable consequence.

The earlier portion of this volume is occupied by the reprint of the sketch of this movement prefixed to Lord Russell's Speeches; and it is just that this should be so, for it is not only the story of the British Constitution, but of his own fame. In 1819 he obtained an enquiry into the condition of the borough of Grampound, and after having convicted it of bribery, proposed that its franchises should be transferred to the growing town of Leeds—laying down, as he says, in this single proposition the whole principle at issue between the Government and the Reformers. This he carried in the House of Commons, but the seats were transferred to the county of York by the House of Lords. He found scanty encouragement among his own friends to proceed further in this direction, Mr. Tierney not allowing it to be made a party question, and old Lord George Cavendish saying it was never touched without doing them injury. This did not prevent him from presenting to the House in 1822 a complete scheme that provoked the magnificent tirade of Mr. Canning, prognosticating at once his future success and its disastrous effects upon the constitution of his country. It was thus but natural that when, eight years afterwards, the Whigs succeeded to power, Lord John Russell formed part of the committee to prepare a measure of Parliamentary reform; but it is surprising and contrary to our present usage, that with his advantages of station and his well-won Parliamentary repute, he should not have held office in the Cabinet. The fact that vote by ballot was proposed by Lord Durham, and formed part of the scheme presented to Lord Grey, is not altogether new; Sir James Graham having mentioned it in the House of Commons, with the addition that secret suffrage would have formed part of the measure then brought before Parliament, but for the resolute opposition of one member of the Committee, who he left the House to infer was himself, but who is now generally believed to have been Lord Duncannon. It would have been no breach of confidence if Lord Russell could have told us the true circumstances of this important omission. It now seems certain that if Sir Robert Peel had treated the bill as a chimerical revolution, the first reading would have been lost, and the whole question indefinitely delayed, or subjected to considerable modification. But a nine days' debate roused the country and secured the ultimate success. Lord Russell tells us that he now regrets his want of candour in not stating to the House his share in the preparation of the measure, but assuredly he has lost nothing by that momentary abnegation, and the great reform stands in English history not as the work of Lord Durham or Lord Grey, but absolutely his own. The self-confidence so characteristic of the man as to have been made the subject of much humorous comment, was fostered by his especial training, and exhibits itself in the very readiness with which he confesses his own errors of judgment. He can afford to be wrong, and when the most calamitous consequences have followed on his mistakes,

he is not the less justified in criticising severely the failure of others to remedy his own shortcomings. Thus the distinct admission that he ought to have acted on the opinion of Sir Robert Collier and arrested the *Alabama* does not prevent him from finding serious fault with the American representative for not believing in the good intentions of the British Government. Those who remember the sagacity and heroism with which Mr. Adams conducted himself in the face of an antagonist society and insulting opinion, will hardly endorse this sentiment. Indeed, if Lord Russell had come at once to the consciousness of his error, and done all he could to repair it, by insisting on the exclusion of the pirate from every port in our colonies and dependencies, it is probable that the misfortune would have been reduced within very moderate dimensions; and when, at a much later period, he makes it a matter of accusation against Lord Granville that he did not communicate with him before the mission of Lord de Grey, and implies that his statement of the case would have modified the demand, and mitigated the indignation of the United States, the question naturally suggests itself whether Lord Granville might not have thought it a breach of delicacy and official confidence to propose to him to incriminate himself when he had so long assumed a defensive attitude. It is the least of our regrets that that four days' indecision has cost the country a million a day, and it would be satisfactory to know that even this long delayed statement may be not without its use in healing the great division between kindred nations. However Lord Russell attempts to take away from the grace of his candid acknowledgment by exaggerated lamentations over British concessions, he may be sure that posterity will regard them as condonations of misjudgments and perverseness far graver than his own.

The good temper and general moderation of these pages do not extend to the record of the party divisions that broke up the Government to which Lord Russell succeeded on the death of Lord Palmerston. We all remember the humorous application of a passage in Jewish history by Mr. Bright, and there is no great harm in the extension of the metaphor which gives the name of "bandits" to the refugees of the Cave of Adullam. But it is beyond a joke when Lord Russell, after the reservation that "there were, no doubt, some honest men in that company," goes on to say that

"he had never known in his long political life a party so utterly destitute of consistent principle or patriotic end—indifferent to the state of the suffrage or the disfranchisement of the boroughs, provided their own selfish objects were attained."

Now, of this section the present Duke of Westminster, Lord Lansdowne, and Lord Elcho were prominent members, and Mr. Lowe the chief orator. They may have shown a great absence of political prevision in preferring the disruption of their party to an inevitable extension of the suffrage; and they may have contributed largely to the very event they most earnestly deprecated, the supercession of the middle class by the popular masses in the larger towns; but there is assuredly no ground for the imputation of

personal objects when it is notorious that they refused to take part in a combination by which two at least of the persons named would have obtained seats in the Cabinet, with a fair distribution of subordinate offices among their friends.

But the acerbity which has dictated the remarks on the close of Lord Russell's administration does not end here: the same spirit animates much of the remainder of the volume. This portion, indeed, altogether loses the importance of the earlier recollections and suggestions, and declines from the range of political memoir to that of newspaper criticism. For here Lord Russell is no longer the actor in history, and though it may satisfy curiosity to know that he thinks Mr. Gladstone might have composed his Administration more judiciously—that Mr. Cardwell would have been a better Chancellor of the Exchequer than Mr. Lowe, and that Mr. Bruce made an unpopular Home Minister when he would have been a good Minister of Education—yet these are no more than opinions; easy and by no means indisputable judgments after the event. There are men who think that Mr. Forster has achieved what would have been impossible for Mr. Bruce, and that the Licensing Acts of the late Government bear a strong analogy to the new Poor Law, by which the Whigs of an earlier time incurred so much contemporary odium, and earned so much national gratitude.

In still more reckless language, after doing justice to Mr. Gladstone's financial skill and courage, he deliberately commits to paper what might have been admissible (and very much in Lord John's manner) as the conclusion of a party speech, viz., that "he regrets to have found himself wrong in having believed that Mr. Gladstone was no less attached than himself to the national honour, that he was as proud of the achievements of our nation by sea and land, that he had no ill-will to the extension of our colonies, and that his measures would not tend to reduce the great and glorious empire of which he was put in charge to a manufactory of cotton cloths and a market for cheap goods, with an army and navy reduced by petty savings to a standard of weakness and inefficiency."

It is certainly unbecoming that any one politician of high station should make such an indictment as this against another in an off-hand manner. It says too much and too little—whether true or false it demands abundant proof and confirmation, and has really no value as a simple assertion. As an illustration of the necessity of some investigation before this summary decision, it may be mentioned that while Lord Russell's estimate of Mr. Gladstone's feelings towards our Colonial Empire is supported by common rumour, and some confirmatory expressions may possibly be found in his speeches, as a matter of fact the only serious surrender of territorial power in our time, that of the Protectorate of the Ionian Islands, was the unexpected act, not of Mr. Gladstone, but of Lord Russell himself, and that it is to the Cabinet of Mr. Gladstone that we owe the acquisition of the possessions in West Africa that provoked the Ashantee war, and the project accomplished by the present Government of the annexation of the Fiji Islands. Again, with regard to the niggardliness of the

late military administration, the high-handed measure of the Abolition of Purchase, *per fas et nefas*, was hardly an indication of a willingness to stop short of a supposed improvement and efficiency from pecuniary motives, and it is surprising that its opponents did not make more use of that flagrant contradiction to the professions of national economy.

In another notice of this work, Lord Russell's suggestions for the legislation of the future in Ireland, and on the subject of national education, may well deserve consideration and criticism; but his religious lucubrations are not likely to elucidate either the past or the future of controversy. His Ecclesiastical Titles Bill was nearly as great a political blunder in its time as Mr. Gladstone's pamphlet is to-day; and, indeed, he is now convinced that a resolution of the House of Commons declaratory of the Queen's supremacy in the matter of episcopal designations would have produced all the effect he desired without the impotent affront to the Catholic community. His observations on the Ritualist disturbance in the Church of England are an expansion of the sentiment of the famous Durham letter, of which two good stories have been told—the one, that Lord Clarendon laughed at Sir William Somerville for not seeing that it was a hoax; and the other, that when it was read in the Cabinet, Lord Palmerston remarked that nothing could be better written, but that he trusted it had been marked "confidential;" and shared the general consternation of his colleagues when informed that it had been sent to the *Times*.

HOUGHTON.

PLACARDS OF THE FRENCH WAR AND THE COMMUNE.

Les Murailles Politiques Françaises. In Three Volumes. (Paris: Le Chevalier, Editeur, 1875.)

M. LE CHEVALIER has put forth an interesting collection of the political notices and placards which covered the walls of French towns between September 4, 1870, and May 28, 1871. The mural literature of Alsace-Lorraine from the declaration of war between France and Prussia to the day when the German troops evacuated Nancy is also given, and forms the first volume of the series, the second being chiefly devoted to the siege of Paris, and the third to the reign of the Commune. Each poster is reproduced in facsimile, even to its colour; and the work presents a complete and picturesque history of France during the Terrible Year. Its pages open with the proclamations of Napoleon III.: they close with a brief general order of Marshal MacMahon, announcing that the last positions of the Communist insurgents have been taken, that the strife is ended, and that "order, work and security" are renewed.

It would be easy to over-estimate the historical value of official proclamations, but they furnish incontestable evidence as to the facts which those who issued them desired that people should believe, and as to the spirit by which they desired that people should be guided. Thus the government of Tours stands self-condemned by its appea

country after the fall of Metz. Then, for the time had assuredly come for giving party cries, and allowing no watchword but France. Of quite a different tenour the language of M. Gambetta and his legues. "So long," they protest, "as we shall remain an inch of the sacred beneath our feet we will firmly grasp the banner of the French Revolution;" a encouraging declaration to M. de Kérat-Breton levies. This document was published on October 30. Two days later the old walls of the Empire left in Paris must have been as they read the decree for a *plé-* signed by Jules Favre, who in previous May had so eloquently denounced that method of taking the popular lion. A terrorist circular was even dictated which ran thus: "Notice to voters. YES signifies, We maintain the Government of National Defence. NO signifies, We overthrow the Government." Towards of 60,000 voters did wish to throw the Government, and said so. These irreconcilables contribute largely to the pages of M. le Chevalier's compilation. Every few days a flaming handbill announced a new plan for saving Paris and regenerating France, presumably by a patriotic artisan of Belleville or Montmartre. With the same object the "Club de la Solidarité" held its meetings. Among the conditions of membership in this select society were freedom from all religious obligations, and a subscription of five pence a month. Its prospectus may be suggested one of the most amusing ones in *Rabagas*. To an equally emancipated school of thought probably belonged Thobois, architect, once the colleague of Renan in the scientific mission of the desert to Phœnicia. He has the honour to inform the public that he has discovered the secret of aerial navigation, and that on the sum of 300,000 francs and the Place du Troussel being placed at his disposition, he will in the space of one month deliver both France and Germany. The promise held out to both countries may sound mysterious, but Thobois is a philanthropist, and heads his proposal with the legend "Universal Republic," which may account for the friendliness therein displayed toward the Germans. Three days later appeared the unlucky address of General Ducrot to the Second Army in Paris, and his boast being in print is added down to posterity:—

"Before you, before the whole nation, I take a solemn oath: I will not re-enter Paris, except dead or victorious; you may see me fall, you will never see me flinch. When I am fallen, pause not, but avenge me!"

General Ducrot's gasconade, it is fair to say, is better known than his bravery, which is conspicuous on all occasions.

There are advanced Republicans who are the pacific principles of the Society of Friends. At the beginning at the siege they pressed, in a bright yellow placard, their conviction that if the Prussians were earnestly argued with, they would see the wickedness of attacking Paris. Christ, they declared, had said "Seek, and ye shall find; knock, and it shall be opened unto you." These maxims (they feared) were not always true: one knocked at the door of a prince or of an aristocratic mansion without an equipage,

or without a high recommendation, the porter would answer "You enter not." But the maxim was true when one demanded what was absolutely just—and so forth. Close to this production is a kind of pastoral epistle from Mr. Congreve, who, with that absolute imperviousness to the humorous which characterises Positivists and Scotchmen, apostrophises Paris as a Holy City. He laments the apathy of England. Her Queen is in the mountains of Scotland, far from care and trouble; her first minister is visiting exhibitions or at Clumber; her minister for foreign affairs is in *villeggiatura* at Walmer; her first lord of the Admiralty in Belgium. Her nobles and her gentlefolk are at their annual destruction of game. On October 3, Dr. Robinet, High Priest of the Comtists for the whole Western Republic, solemnly anathematised Germany. "The malediction of humanity" is invoked upon her devoted head, and the destinies are hidden to accomplish themselves. Strange to say, this document is dated, after a carnal fashion, October 3, 1870. It commits two unpardonable historical solecisms, speaking of the Dukes of Brandenburg and of the Holy *Germanic* Empire. Deficiency in the sense of humour is not confined to Positivists and Scotchmen. Thus the proclamation of a district mayor runs:—"French Republic. Liberty, Equality, Fraternity. Kidneys will be sold at 1 fr. 50 the $\frac{1}{2}$ kilogramme."

Curiously enough, an act of clemency on the part of a Prussian officer enabled the editor of these volumes to bring home to the Prussians the charge (which they denied) of having purposely fired the town of Saint Cloud. On January 28, the German troops did, as it appears, receive orders to burn the houses of Saint Cloud. While the work of destruction was proceeding, a major on the Staff was posted near the church, and from thence surveyed the execution of his orders. The house where dwelt a woman whose name is, for obvious reasons, withheld, was about to share the common fate, when its proprietor rushed towards the major, threw herself at his knees and entreated him to spare her home, reminding him at the same time of little services she had rendered the Prussians during the occupation. Picking up a half-burnt brand, the officer scrawled over the shutters in German, "This house is to be spared till further orders. January 28. Jacobi, Major at Head-Quarters." A facsimile of the shutter and its inscription is given in M. le Chevalier's book. It will be observed that the Prussians determined to reduce St. Cloud to ashes on the very day that Favre and Bismarck were signing the convention for the armistice.

The volume devoted to memorials of the Commune is a little disappointing. Well-authenticated anecdotes of that tragic farce made one expect too much. But there are still some instructive facts to be gleaned from the *Murailles de Paris*. Thus, three days after the insurrection had commenced, one lights upon traces of Prussian coquetting with the Commune. Major-General von Schlotheim writes, on March 21, "to the actual Commander of the Forces in Paris," to say that he has received orders to maintain a friendly neutrality so long as the

terms of peace are not called in question. Boursier, delegate for Foreign Affairs, replies on the morrow that the "Central Committee," as the insurgents at first termed their government, had no idea of impugning the validity of the preliminaries of peace ratified by the National Assembly. For the publication of untruthful military bulletins the Commune can scarcely be blamed. It merely followed the immemorial usage of war. On April 30 Rossel was named delegate for the War Department. On May 9 he was so ill-advised as to announce without reserve that "the three-coloured flag floated over Fort Issy." The very next day appeared a decree appointing Delescluze delegate in his room, and ordering a court-martial to try Rossel. No dry enumeration of dates could speak more eloquently. To do Rossel justice, he displayed extraordinary vigour during his brief tenure of power. A colonel of Engineers, distinguished for professional skill, he must have been conscious that he was leading a forlorn hope. He had hardly been installed in office before he directed the formation of barricades, which, as he knew, could only prolong a strife the issue of which was already certain. The utter want of discipline among the National Guards is indicated by a general order of Rossel's, dated May 9. He finds it necessary to tell the men under his command that they are on no account to cease firing while in action, even at the sight of a flag of truce. Such a direction implies, of course, that common soldiers had taken upon themselves to recognise flags of truce without waiting for their officer's commands. Again, he forbids them, under pain of death, to continue firing after the word to cease has been given, or to advance after they have received orders to halt.

M. Thiers has often been reproached with inconsistency—as, indeed, have been most statesmen worthy of the name, the course of history constantly revealing new necessities to the careful observer of events. But the Communists did prove when they covered the walls of Paris with extracts from old speeches of M. Thiers, that he had in former days spoken with singular rashness and want of foresight. It was on January 31, 1848, that he exclaimed from the Tribune—

"You know, gentlemen, what is passing at Palermo: you have all thrilled with horror at learning that, during forty-eight hours, a great city has been bombarded. By whom? By a foreign enemy exercising the rights of war? No; by its own Government. And why? Because that unfortunate city demanded its rights."

A "Friend of Order" recalled to the Parisians other words of the President in the year 1840, which, with the important addition of a negative throughout, would have been prophetic. He declared himself astonished (in the Chamber of Deputies) at persons imagining that fortified works of any kind could be a menace to liberty. Those who expressed such opinions regarded matters from an unreal—from an impossible point of view. It was a calumny on any government that might arise to suppose that it could one day seek to maintain itself by bombarding the capital:—

"What!" he concluded; "after having pierced with its shells the dome of the Invalides or of the

Panthéon—after having flooded with its streams of fire the dwelling-place of your families—do you think that government would dare to present itself before you to demand the confirmation of its powers? Why, it would be a hundred times more impossible after the victory than before it.”

E. C. GRENVILLE MURRAY.

The Amazon and Madeira Rivers. By Franz Keller. (London: Chapman & Hall, 1874.)

THIS handsome volume, a translation of the *Vom Amazonas und Madeira*, published in Germany during the same year, furnishes an important addition to our knowledge of an interesting and little known part of the South American continent. The author, Mr. Franz Keller, an engineer in the service of the Brazilian Government, was commissioned in 1867 to make a survey of the long series of rapids and cataracts which impede the navigation of the Madeira river, and which are supposed to be the only obstacles to an extensive trade ready to spring up between the interior provinces of Brazil and Bolivia, on the one hand, and the Atlantic sea-ports and Europe on the other. It was part of his mission also to ascertain the practicability of a railway along the banks of the stream, to connect the navigable portion of its upper waters with that of its lower course below the last rapid. Mr. Keller left Rio de Janeiro, on this important errand, accompanied by his father, in November, 1867, and returned to that city in January, 1869; not too long an interval, be it observed *en passant*, in which to accomplish some 7,000 miles of travel, and execute engineering surveys over a length of 230 miles of river (the length of the section obstructed by rapids), with so small a staff as four persons, all told. In May, 1869, his official report, consisting of sixty-one large octavo pages, was presented to the Minister of the Interior in Rio. The principal engineering details of this report, or such as are calculated to interest general readers, are added to the popular account of the journey in the work before us, and will be welcome to all who value solid information in books of travel.

The grandeur of the idea which led to the mission of Mr. Keller becomes evident when we examine the position of the Madeira on a map of South America, and duly weigh the facts which he gives in the appendix to his work. The upper waters of this vast tributary of the Amazons are seen to consist of a number of affluents, each, according to our European ideas, a great river, spreading like a fan over the fertile plains of Bolivia, and partly over the adjoining Brazilian province of Matto Grosso. It is stated that these streams are navigable, and continue so nearly to the north-eastern frontier of Bolivia; at that point the main stream of the Madeira has acquired the dimensions of a first-class river, having an average width of more than a mile down to its junction with the Amazons. For the last 560 miles of its course the river is again navigable, and by large steamers; in fact it may be said to be here open to the maritime commerce of the world, inasmuch as ocean-going vessels now pass its mouth (800 miles from the Atlantic) on their way

to the city of Manaus, 200 miles above it on the main Amazons. Unfortunately for the welfare of the populations of Bolivia and the Brazilian interior provinces, the navigable upper streams are severed from the great water highway lower down by the series of rapids and falls of the middle course of the river; could some means be devised of removing or avoiding the obstruction, a bright prospect would be opened to stagnant communities, in which, it is fair to say, the rest of the civilised world would participate. Bolivia is rich in mines, forest-productions and pastures, and contains a population of two and three-quarter millions of souls, mostly settled on the plains of the interior, and separated from the Pacific by the ranges of the Andes and a broad zone of sandy desert; the mining country of Matto Grosso is equally isolated from the Atlantic marts of Brazil. To construct a cheap railway past the unfortunate obstructions, would be to bring these regions into direct water communication with the Atlantic. It was an idea worthy of patriotic statesmen, even if they have not sufficiently weighed the great difficulties of the undertaking, arising from ignorance of the physical and economic obstacles to be overcome, and the total absence of civilised population within a radius of six or seven hundred miles from the proposed works.

To do Mr. Keller justice, he is not enthusiastic concerning the immediate results of his survey, and does not mention the fact that the railway has been undertaken. The introduction to his work gives a very fair general account of the Empire of Brazil and an impartial view of its resources and prospects. In his narrative there is no attempt to under-estimate the magnitude of the difficulties which lie in the way of the development of communications by way of the Madeira. The total length of river course obstructed by rapids he found, as already stated, to be 230 miles; within this distance he observed no fewer than seventeen falls of greater or less slope, varying from vertical cataracts of thirty-six feet drop, to rapids sufficiently obstructive to require consideration. At three of the falls it was necessary in ascending to haul the canoes by land past the obstacle, and at nearly all the remainder they had to be unloaded and towed by Indians; the cargoes being carried along the banks. Yet the total slope of the river from the first falls to the last is very slight—only 228 feet, or an average of one foot per mile. All his observations of the altitude of places above the sea confirm the curious results arrived at by many previous explorers, as to the smallness of the difference between the level of the Atlantic and that of the great river in the centre of the South American continent. At Serpa, 700 miles from the mouth, his measurements give the surface at low water as only fifty-nine feet above the mean level of the sea; and at the commencement of the falls of the Madeira, 1,360 miles from the mouth of the Amazons, the altitude was only 200 feet. The great distance above the mouth of the river (500 miles) at which the tides are felt, is another confirmation of the near approach to the sea-level of this wonderful river, the lower part of which, for a thousand miles, must be considered for

all practical purposes as an arm of the sea, and its shores as maritime districts.

Mr. Keller has not, we think, adopted the most attractive arrangement of the matter of his book; giving the narrative briefly in two chapters, and all his remarks on the country, its productions and people, in classified order under separate chapters. The usual method would certainly have been better, namely, that of interspersing the general observations throughout the narrative. His style, however, is pleasant; he describes well and imparts a great amount of interesting and solid information under the various heads he has chosen. Thus we have a chapter on “Canoe and Camp Life;” another on “Hunting and Fishing;” a third on the “Vegetation of the Amazons Valley;” a fourth on the “Wild Indian Tribes,” and so on. The country in the neighbourhood of the falls of the Madeira is still in the possession of aboriginal tribes, the principal of whom, the Caripunas, sometimes attack passing traders. Keller’s party fell in with bands of these picturesque savages, and some of the most interesting parts of his book relate to his intercourse with them. Except a few small canoes which pass annually up and down the river, bringing down produce from the Bolivian settlements to exchange for European goods at the towns on the Amazons, the Madeira is visited only by parties of india-rubber collectors, who meet with great success in the boundless virgin forests of its banks, where the tree yielding this costly sap exists in great abundance. In one of his chapters Mr. Keller gives an exhaustive and amusing account of the mode of collecting and preparing the rubber.

An important feature of the volume is the engravings, sixty-eight in number, with which it is adorned. These are far superior in design and execution to those usually met with in books of travel. The author informs us that he not only sketched the scenes from nature, but copied his drawings on the wood-blocks himself. The result shows that he is an artist of no mean attainments; but we do not think he has succeeded so well in the Indian figures and groups as in the landscapes, and especially in the details of tropical vegetation. Rarely have these been presented in the illustrations of books of this class with such fidelity and beauty as in the sketch of Caripuna Indians with Tapir at p. 89. Many of the engravings being of large quarto size, a correspondingly large format for the volume has been required; but it would be a matter for regret if this circumstance should stand in the way of a wide circulation for so meritorious a book of travels.

It is with reluctance that we allude, in conclusion, to certain shortcomings in the translation. Surely it is necessary in a book for English readers to reduce all measurements of temperature, size and distance to English scales. All these, however, are left untranslated. The temperatures are Centigrade and Réaumur, and the distances in metres; but a serious confusion is caused when miles are mentioned, as they are styled “geographical miles,” although it is evident that German miles are meant, which makes a vast difference, especially when areas are in question. Without special attention, a most

erroneous idea would be conveyed by the table of areas in square miles of the Brazilian provinces, at pp. 2 and 6, where after having just stated that the empire was nearly as large as Europe, the author gives its area as "144,500 geographical square miles;" an unintelligible statement to those who remember that Europe contains nearly two millions of square miles. In a work dealing largely with the result of surveys, greater attention should have been paid to all the numerical data. We notice also numerous misprints, in most cases of proper names; such as *Puro Preto* for *Ouro Preto*, *Bertholetis excelsae* for *Bertholletia excelsa*, and many others. In one place (p. 57), the difficulties are alluded to of passes over the Bolivian Andes "at least 1,500 feet (!) above the sea-level." A good map of the part of the Madeira explored, with a sketch-map on a small scale of South America, would have been useful additions to the work. The original German edition, we notice, has a map of this kind. H. W. BATES.

History of the United States, from the Discovery of the American Continent. By George Bancroft. Vol. X. (Boston: Little, Brown & Co.; London: Sampson Low & Co., 1874.)

THIS tenth volume of Mr. Bancroft's *History of the United States* forms also the fourth of his *American Revolution*; and judging from the statement prefixed to the ninth volume, that "one volume more will complete the American Revolution," as well as from the decisive monosyllable "End" which closes the present one, it is intended to be the last. The contents spread over the four years 1778-1782, closing with the signature by the American Commissioners of the provisional articles of peace, November 30, 1782. It is to be presumed, therefore, that in the judgment of the veteran historian the American Revolution terminated with this act, although it left the British troops in the occupation of two chief American cities for a twelvemonth longer, and although to many the revolutionary era would seem not to have closed till the "rope of sand" of the Confederation gave place in 1787 to the firm bonds of the Union.

A large portion of the volume, and probably nearly all of novelty that it contains, consists of diplomatic matter, for which, as the preface shows, the archives of France, Prussia, Austria, Russia, and Holland, as well as of Great Britain, have been ransacked, besides unpublished papers of the American Peace Commissioners, and of two of the English ones. Mr. Bancroft claims also to have been able "to trace the division between the North and the South, arising from slavery, further back than had as yet been done;" and this is in a measure correct, although Professor Von Holst's work, *Verfassung und Demokratie der Vereinigten Staaten von Amerika*, reviewed some months back in these pages, which might perhaps have deserved Mr. Bancroft's notice, contains many of the facts from which he derives this conclusion.

The four years over which this volume extends offer but little interest, so far as the war in America itself is concerned, as com-

pared with the earlier ones. From the moment that France, followed soon by Spain, enters into the struggle, instead of becoming fiercer on the American continent, it only slackens. So far as yet were the Americans from that self-reliance which years of independence have since developed in them, that as soon as they won allies for themselves, they were disposed to cast the whole burthen of the war upon the latter, and could only be whipped up by the most earnest appeals, the most strenuous exertions, to make any efforts themselves, either in men or money. Not a battle was fought by the Northern army under Washington after that of Monmouth (June 28, 1778)—a mere blow struck at a retreating foe, which only delayed his progress by a day—until the siege of Yorktown. From the time of the battle of Monmouth till the news of the signature of the preliminary articles of peace, a period of more than three and a half years, it is almost incredible to think that the British forces were left virtually unmolested in New York, simply because the American people could not be brought to supply a trusted commander-in-chief with sufficient means, even with French assistance, for driving or starving them out. The campaign in the south, interesting as it is, was only the result of British invasion, and Charleston, like New York, was only at last voluntarily surrendered by England at the peace. For stubborn perseverance under defeat, bull-dog tenacity in pursuit, constancy under all hindrances, Greene is almost another Washington, and, like another Washington, he is equally starved of support by his country. Imagine the position of the commander of an army, to whom his finance minister has to write, "You must continue your exertions with or without men or provisions, clothing or pay!" No nation ever struck the first blows for independence with more fervid enthusiasm than the Americans; none ever more sluggishly the last. When Clinton, after that surrender of Yorktown which virtually stopped the war, was willing to be responsible for the conquest of America if he could only have 10,000 additional men, he was probably wrong, for he had Washington still in front of him. But Washington himself knew that it was "high time for a peace," and when at this day one considers carefully and dispassionately the position of the belligerents at the end of 1782, it is clear that England was the least exhausted of any, and that had she not been engaged in a cause which her own people felt to be an iniquitous one, a few more blows, such as she was alone capable of dealing, might have secured, though only for a time, her material triumph, and thus delayed by perhaps a decade or two the final loss of the American colonies. Thank God that it was not so! Sharply as we may feel to this day the pang of that rending in twain of our great English race, England's victory, on the ground which she had taken up, would have been the knell of freedom throughout the world; her defeat rang in the renewal of its life, and peals yet in every successive conquest which it has since achieved. The struggle with America gave to ourselves the publicity of Parliamentary debates; Pitt's, the first great motion for Parliamentary Re-

form, was brought forward in the interval between the cessation of actual hostilities and a formal peace. For the continent of Europe the American revolution was the forerunner of that far more terrible struggle in France, which, as its results unroll, seems to have given more of freedom to almost every civilised country than to that in which it took place, although, if we except hapless Poland, there is not one whose share it has not increased. And if, through the shock of conflict which it involved, that struggle retarded for a while our own constitutional development, this has since proceeded for us on the same lines which were virtually opened out through American independence, those of "peace, economy, reform." To Spanish America, lastly, the American revolution gave in due time both independence and the forms in which it is clothed, while it has throughout the world introduced freedom into the relations between colonies and the mother-country, either through that almost absolute self-government which England freely concedes to her own, or through colonial representation in the Parliament of the mother-country, as in the case of France and Portugal.

Mr. Bancroft may well be congratulated on having brought to a close the history of a period so momentous in its results. His work, though it will not place him in the front rank of historians, even among those of his own country, is likely to remain a standard one, and by its fulness and what may be called its workmanlike character deserves to do so. It is moreover observable, that in quality it has improved as it has gone on; that through the mellowing either of age or official experience it has, besides acquiring more comprehensiveness of scope, gained also in moderation of tone. Perfect impartiality as between his own countrymen and foreigners is not indeed to be expected from the author. Those negotiations for the exchange of prisoners, which occupy so large a place in Washington's correspondence during this period, and throughout which the object of the Americans appears to have been either to keep as long as possible a large number of trained English soldiers in their hands, as against their own raw levies, whose terms of engagement were mostly long since expired, or, if compelled to give them up, to entrap England into some political concession, find no place in the pages of the present volume. There is an evident slurring over of the discreditable haste of the American Commissioners in signing a peace behind the backs of their French allies, although admitted ere this by his own countrymen, as will be seen by reference to Jared Sparks's *Life and Correspondence of Franklin*. Cases like those of the execution of Hayne and Huddy have two sides to them, one of which is barely indicated. In some instances, indeed, perhaps a slur is cast where none is intended; but probably few people, reading of Burke's acceptance of office under the second Rockingham ministry, that "He was more than content with the rich office of paymaster for himself, and lucrative places for his kin," would imagine that one of the first uses he made of place was, in bringing forward again his plan of economic reform, largely to cut

away the emoluments of his own office. English readers, one trusts, are mostly aware of this, but one doubts whether American readers are, and for their benefit it would have been surely better, if not more candid, to have qualified such a sentence by a note. Mr. Bancroft's English hero, it must be added, is Lord Shelburne, Burke's conduct towards whom is one of the uglier passages of his career; but just on that account a true historian should have been scrupulous in giving the latter his due in a matter wherein he deserves all praise.

Mr. Bancroft's style, never unfortunately pleasant, is in this volume strongly tinged with what may be called Continentalism. "Complot" is an ugly Gallicism which one may have met with in previous volumes, but in the present one it is odiously prominent, giving, for instance, a title to a whole chapter, "The *Complot* of Sir Henry Clinton and Arnold." No less unpleasant in the same direction is "she *repugns* every exertion." On the other hand, in the use of the term "regent" in place of "ruler"—"He united in himself the qualities of a great *regent*,"—Mr. Bancroft has slid into a Teutonicism as unmistakeable as it is useless. Indeed, that there should not be a stronger Teutonic flavour in Mr. Bancroft's style is rather matter for surprise, when one considers the large space he has allotted to Germany in the present volume. Whether, indeed, many readers will be disposed to accept his character of Frederic II. as of one who "lived with and for the people," may be a question; as also, whether his description of Duke Charles Augustus of Saxe-Weimar as "warm-hearted," is exactly carried out by the statement in the same sentence that at the age of nineteen, while he refused leave to open recruiting offices for the English service, he "consented to the delivery of vagabonds and convicts." "Cold-blooded 'cuteness'" would, perhaps, be rather the term which a reader would be inclined to apply to such a transaction who is less of a Philo-Teuton than the United States Minister at the Court of the German Emperor. J. M. LUDLOW.

Contes Populaires recueillis en Agenais.
Par M. Jean-François Bladé. Traduction Française et Texte Agenais, suivis de Notes Comparatives par M. Reinhold Köhler. (Paris: Librairie Joseph Baer, 1874.)

A COLLECTION of popular tales annotated by Dr. Reinhold Köhler is always a welcome boon to students of folk-lore. So copious are his stores of learning, drawn from the popular literatures of all nations, that he is able to render precious even a commonplace text by the richness of his attendant commentary. The collection now before us is interesting in itself, both to the philologist and to the comparer of folk-tales; but its value in the eyes of scholars will be greatly enhanced by the fact of its being attended by fifteen pages of "notes comparatives," into which Dr. Köhler has compressed such a mass of information as only he or Professor Felix Liebrecht could supply.

M. Bladé published in 1867 a collection of "*Contes et Proverbes Populaires recueillis*

en Armagnac," and he has now done the same good service for the stories he has found in the Agenais, a district which formerly extended along both banks of the Garonne, coinciding with the ancient bishopric of Agen. But in 1317 the creation of the diocese of Condom reduced the feudal and ecclesiastical Agenais to the portion situated on the right bank of the river. By visiting the much frequented fairs in this district he was enabled to make acquaintance with some thirty possessors of popular lore, but he has chiefly drawn upon the stores supplied "by three persons, gifted in the most eminent degree with such respect for tradition and fidelity to old memories as are becoming more and more rare." Each story is given exactly as it was written down, but the Agen text is accompanied by a translation for the benefit of ordinary Frenchmen. The stories comprise eight "*Contes*," which M. Bladé defines as tales which both the teller and the hearer acknowledge to be fictions of a marvellous nature—five "*Récits*," or anecdotes which, if not true, are at least truthlike, and are usually of a humorous cast—and five "*Superstitions*," which are generally accepted as true by the narrator and his audience. For the last division, "*legends*" would perhaps have been a better designation.

The story of "*Peau d'Ane*" is a version of the widely spread tale of the heroine whose betrothed or husband deserts her, but is eventually won back. The opening is that of "*Beauty and the Beast*," but instead of an inferior animal, a king of France demands a maiden's hand as a recompense for not eating her father, and strangely enough two out of three girls refuse the proffered diadem. "*Les Deux Jumeaux*" are heroic twins, one of whom saves an exposed maiden from a "seven-headed beast," and marries her. She warns him against a certain house, but he attempts to enter it. Being induced to pass a hair of his head through the cat's-hole in the door, he is swallowed up by the earth. His brother coming to seek him, substitutes a hair from his steed's mane for one of his own, so he escapes from the earthquake which swallows up the house, and afterwards he storms the fatal house and releases his engulfed brother. "*Les Deux Filles*" is one of the usual stepmother stories, in which the pretty stepdaughter is deserted by her father in a wood, but finds in it a castle, the proprietress of which receives her hospitably. As on taking leave she chooses the worst of the presents offered her, she is rewarded by many good things, including three stars which descend from heaven to rest upon her brow and chin, and is married to the son of the King of England. But her half-sister, "ugly as sin," who visits the castle, behaves greedily, and therefore is utterly disgraced, and forced to become the wife of a drunkard who beats her twenty times a day. The opening of "*La Gardeuse de Dindons*" is one of those variants of the King Lear story in which a monarch who is very fond of salt is told by his youngest daughter that she loves him as much as he loves salt, whereupon he disinherits her. But that episode has been forgotten by the Agen narrator, in which the mistaken parent is brought by a saltless dish to a sense of his daughter's real affection for him. The second

part of the story is that of "*Cinderella*." Most remarkable among the other *Contes* are two Vampire stories entitled "*La Goulue*" and "*La Jambe d'Or*." In the former a girl of eighteen cares for neither dances nor sweet-hearts, but is always longing for raw meat. One night her fond parents, being unable to procure any at the butcher's, dig up a corpse, cut off its left leg, and present it to their hungering child. She eats up every morsel of its flesh, then cracks its bone and sucks the marrow. All night long a voice is heard around the house, crying "Give me back my leg." The next day the girl, being at home alone, finds suspended from the crook in the kitchen a corpse, wanting its left leg. It orders her to heat water and wash its right leg. She does so. Then it tells her to wash its left leg. She replies that it has none, whereupon it carries her off to its desecrated grave and there eats her. The other story is of a similar nature. A lovely lady, one of whose legs is of gold, is buried by her sorrowing lord. But at night her footman digs her up, and carries off her precious limb. Next morning the grave-digger reports that the buried lady is screaming for her golden leg. The husband visits her grave, explains to her that she has been buried with both legs on, and promises to have masses said for the repose of her soul. But the screams go on. Her waiting-maid pays a similar visit with no better result. Lastly the footman goes, though much against his will. And when he says, "What do you want, madam?" the lady cries, "I want you," and bursting from the earth, she seizes that footman, drags him into her grave, and there eats him up. Of this horrible tale, which seems entirely out of keeping in the West of Europe, in which the dead seldom evince such morbid appetites, Dr. Köhler gives four variants. In the first, from Oldenburg, a servant-maid steals the leg of her buried mistress; in the second, from Schleswig-Holstein, a mother steals her son's golden leg; in the third, one of Colshorn's *Märchen*, a grave-digger steals a little girl's golden leg. The fourth is the English tale contributed by Mr. Baring Gould to Henderson's *Notes on the Folk-lore of the Northern Counties*, in which a husband purloins his dead wife's golden arm. To these we may add a Russian variant, from Tver, the eighteenth of Chudinsky's *Russkiya Narodnuiya Skazki* (Moscow, 1864). In it an orphan girl, after the death of an aunt, one of whose legs was of gold, is reduced to utter distress. So she goes one dark and rainy night to the churchyard, and opens her aunt's grave, intending to carry off the golden limb. In the grave there is no trace of her aunt, except the leg of gold. This she seizes and sets off home. But on the way back she sees her dead aunt drawing near, hears her voice asking after her golden leg, and falls senseless to the ground. Next morning the passers-by find her lying there dead. But the golden leg has disappeared.

The "*Récits*" contribute little that is new, except the information that Henri IV. is represented by Agen legends as a gigantic being, strong as a bull. But among the "*Superstitions*" there are two which are curious. "*L'Homme aux Dents Rouges*" belongs to the cycle of stories relating to a journey to the other world, but Dr. Köhler

not aware of any other tale which answers in its entirety. A girl refuses to marry a wooer with red teeth overcomes her reluctance to wed. As her husband disappears every morning, to return at night, induces her brothers to follow him. The first brother fails, but the younger succeeds in discovering how he spends his time. Among other things, he serves a mass in a church, on the altar of which burn tapers, shorter than the rest, and against the walls of which birds keep flying. Eventually he explains to his inquisitive brother-in-law that the birds which beat against the windows were the souls of unchristened children, and that the short taper was the soul of that brother-in-law's life, soon to be extinguished. The other story, "*Le Jeune homme Châtié*!" is that of a false lover who pays his unfortunate love. She dies, and the avenger preys upon her betrayer's heart. He goes with a fellow pilgrim to Rome, confesses his sin to the Pope. And the Pope summons his companion, and tells him that on the return journey a strange demon will fasten upon the penitent, who must bear it with him, and at night will come along with it to his chamber. Into that chamber no one is to enter, whatever may happen. All this comes to pass. As the demon toils along, a beast, which afar off seems small, and close at hand appears big, is on to the penitent's back, and holds him there by its claws. The penitent bears with him to his room. And at night a terrible uproar is heard within his chamber, but no man dares to enter therein until the next morning. Then the room is found to be empty, nor is anything ever heard afterwards either of the man or of the demon.

W. R. S. RALSTON.

Life of Thomas Fuller, D.D., with Notices of his Books, his Kinsmen, and his Friends. By John Eglington Bailey. London: B. M. Pickering. Manchester: J. J. Day, 1874.)

THIS is one of those rare books that seem to grow still rarer year by year in these manufacturing days, and which, though rife with faults were multiplied fifty-fold, ought to be received with thankfulness by all who care for the great names of English literature. In ink and pen, not paste-pot and scissors, have been the implements used on it; and as usual, perhaps inevitable with such type and book, the thing has been overdone in one direction and underdone—as will appear—in the other, and it be altogether too bulky and tedious, the research is so self-evident, the integrity of pains (in the old sense) so marked, the mastery of the entire outward facts so thorough, and the enthusiasm so recently Elia-like, that it were worse than grateful even very much to qualify one's goodness and gratitude over such a new work of such a man and wit (again in the old use) as this of Thomas Fuller. Sure we are that the present is just such a book as Charles Lamb would have said "grace" for, and that with much more gusto than for any acceptable dinner, his own "roast pig" not excepted. There have been various inadequate sketches of the life of Fuller, but the best, to wit, Russell's *Memorials*—on which,

en passant, Mr. Bailey could have afforded to withhold Charles Knight's very silly criticism and spared a kindly word rather—is thin and empty beside this huge octavo. Perchance, indeed, its very size and massiveness may frighten away readers, if not buyers. But for our part not one page almost of all the 826 would we wish away,—i.e., everything here brought together deserved preservation *once*. As we shall indicate hereafter, Mr. Bailey may be induced to compact and give another form to his superabundant materials; but for his noble book just as it lies before us in its pleasant discursiveness, piquant asides, chatty quotations, affluent genealogical and biographical and sub-biographical compilations we have little but thanks and praise, seeing that substantially it is a capital piece of honest and genuine work. The special merit of this new Life is the compiler's open-eyed reading of Fuller's own books, and his unfailing utilisation of the very slightest personal detail hidden therein. The special defect is, that if the hero of it chances in any manner of way to be associable with any Smith, Brown, Robinson, or Jones, forthwith there is tacked on a memoir not merely of Smith, Brown, Robinson, or Jones, but of his twentieth half-cousin—which, sooth to say, so comes between the reader and Fuller as to be somewhat provoking. And yet so genial and matterful is Mr. Bailey, that he contrives somehow to interest one in the veriest Smith, Brown, Robinson or Jones of them all; so that for *once*, as already said, the most epexegetical note is welcome, especially as the new and old information, while irrelevant, is often in itself extremely acceptable. A glance at chapter i. will serve as a specimen of the method, or no method, of the entire book. Starting with the Latin "*nomen et omen*," first Fuller and next Thomas are made the text of a constantly digressing dissertation, with quaint bits from Heylin (Carlyle's "*lying Peter*"), and from Fuller himself, and the most out-of-the-way sources early and more recent. As a rule, each quotation and reference is given at first-hand, as shown by the carefully filled-in places and editions. Interwoven with all the lore on the name and surname—*per se* a noticeable contribution to the history of English names—are illustrations and inter-illustrations of every imaginable thing—e.g., Sir John and Lady Fullerton are lugged in, and thereupon comes their punning epitaph and the profound remark, "This is quite in character with the quaintness of the reign of King James" (p. 5)! Again, "*Epoche*" is incidentally quoted, and lo! there is a note on *epoche*, *epochee*, *époche* as a trisyllable correspondent with—*épitome*!! Once more: in the text we are duly informed that "to none of the branches of the family here mentioned, nor yet to the less extensive houses settled in *Surrey, Kent, &c.*, have we been able to refer with certainty Fuller's paternal descent" (pp. 16, 17); and thereupon one would have expected those family-lines to be left unexplored. But so far from this, Mr. Bailey multiplies note upon note, excursus upon excursus, on these same extraneous Fullers! For one, we are furnished with a full memoir of Thomas Fuller, M.D., biographic and biblio-

graphic, and actually a facsimile of Vertue's portrait of him; and yet this Dr. Thomas Fuller had no more to do with our Dr. Thomas Fuller than any of the diverse Fullers enumerated, Mr. Bailey's one plea for introducing him being somebody's having confounded him with the Fuller. By the way, it may be here remarked that the facsimile portrait of Thomas Fuller, M.D., reminds us of others (two vivid steel plates) of Bishop Davenant, with, of course, a memoir of him, because the venerable bishop was our Fuller's uncle and patron. And so in chapter after chapter, the proverbial needle is again and again buried in the up-piled masses of hay—hay, excellent no doubt, but in the road when it is the needle (and thread, too) one is in vain search of.

Enough has been submitted to indicate that Mr. Bailey, among his qualifications, does not possess that of discrimination—or, to put it in another way, that, having accumulated materials in innumerable note-books, he is content to tumble them all out, and so to be a mere "hewer of wood and drawer of water" for some dexterous book-maker, when he shows capacity to be an artist. We put the matter thus strongly with a *souçon* of reluctance, for some may misconstrue it into depreciation; but our wish is to stimulate the Compiler into a Biographer, and the day-labourer into a master-builder. Thus, nothing could be more entertaining, as we have seen, than Fuller's own references to his own name with which chapter i. is filled and running over; but how utterly out of place are they! First of all as anticipating facts and characteristics lying far off in after years, and next as missing the opportunity given in them of illustrating onward the fecundity and pleasantness of his wit as compared with the malicious heaviness of his opponents in their vulgar playing on name and life. Here indeed lies the fundamental mistake of the book as a Life. There is not so much as an attempt to analyse the elements of Fuller's very remarkable and almost (in England) unique genius. There are many good things picked out from his books and many good things said about them and him, but his large and magnificent personality is lost in the surplussage of relatively petty details. Indeed, the treatment of Lord Fitz-Hardinge's truly great and self-authenticating portrait of Fuller, in reproducing it in a very poor and commonplace lithograph, instead of steel from some cunning hand, is ominous. Mr. Bailey, with all his quenchless industry and admirable persistence of search and research, and alertness of vision (without other men's spectacles), fails to dominate his chapters with the man himself, e.g. fails to distinguish critically Fuller's manly and unvociferous loyalty to the Throne from the greedy royalism of too many of his churchly contemporaries, and fails to bring out the many-sidedness of his ample nature as exemplified in his relations—so kindly, so full of wise charity, so magnanimous—to the men of his age, and his catholicity of heart toward every true man. Similarly, in the quasi-analyses of his many books, we have scraps out of them and note upon note about them, but all higgledy-piggledy, and in no wise contributory from chapter to chapter

to that elucidation of his intellectual growth and final estimate of the specialties of the man and the writer, that are demanded in a Life.* That Mr. Bailey has ability to present Fuller as we would have him presented is not doubtful to us; but he must be less loquacious and less captive to his note-books, and willing to suppress very small pedantries and spites of a pseudo-scholarship. Let him be self-restrained and self-forgotten, and he has it in him to write a Life that shall get into men's hearts. We are thus earnest in counselling Mr. Bailey to give us more of Fuller himself, and less about and about and about him, because at the close of his Preface he announces an "abridged Memoir" to be "appended" (why not prefixed?) to an edition of his "collected Sermons in two volumes now in preparation" by him.

In Thomas Fuller he has a subject whereof he might make a Life that would take its place beside Walton's *Lives* earlier and Southey's *Nelson* later. It must be added that the indexes are exceedingly well done. We cannot say much for the illustrations. They are washed-looking, and in some of the monumental ones weak and characterless. The printing is good; but the paper is very inferior and badly discoloured. With every abatement because of excess and digressiveness, Mr. Bailey has won his spurs in this book. He has recalled to this generation a lustrous and most loveable memory. He has spared no toil, no expense of diligence. He has opened out many new veins of biographic and literary enquiry. He deserves, and we trust will receive, encouragement to pursue his studies in this line. How long is Cambridge to leave the wrong undressed of no collective edition of Fuller's works? Non-conformist though he be, the University will not readily find a second so thoroughly furnished for the undertaking as Mr. Bailey, and certainly none more informed with that enthusiasm which is demanded for such a task.

ALEXANDER B. GROSART.

NEW NOVELS.

The Story of Three Sisters. By Cecil Maxwell. (Smith, Elder & Co., 1875.)

Monk's Norton. By the Author of "Mary Powell." (R. Bentley & Son, 1875.)

Baiting the Trap. By Jean Middlemas. (Chapman & Hall, 1875.)

Rupert Redmond. By W. S. Southwell. (S. Tinsley, 1875.)

Her Good Name. By J. Fortrey Bouverie. (S. Tinsley, 1875.)

Innocent as a Baby. (R. Bentley & Son, 1875.)

THE charming *Story of Three Sisters* owes so much of its attraction to a pure and graceful style, that it is scarcely possible to do it justice without long quotations. The plot is something like the expansion into a novelle of the idea expressed in Miss Rossetti's sonnet, "A Trio." Here are three sisters, as beautiful as the Graces, or the three of

Ronsard's pretty poem, living their lives in a quiet country house, at the beginning of this century. They each have their lovers, of course, and the sweetest, Pamela, is, like Sappho's apple, which the pluckers "forget not,—nay—but get not;" or again, like the wild hyacinth flower, "which the passing feet of the shepherds for ever tear and wound." The author has had the pretty idea of prefixing the first of Mr. Rossetti's couplets on this theme to the first volume, and the second stanza to the volume which tells of the passion of Pamela. It is not possible to say that the story is very firmly grasped, or that the perplexities of Pamela's lovers are not shared by the reader. But the characters, especially Mr. Quicke, the old lawyer and lover of art, George Lynton, the beautiful young noble, and Pamela herself, are drawn with tender care and feeling. There is a kind of dimness, or rather a faintness of colour, about the pictures, which seems rather the result of their distance in time, and of the fading passage of years than of indistinctness in handling. If it may be allowed to illustrate the pleasure given by one art by an example drawn from another, we should say that to read *The Story of Three Sisters* is like seeing a long array of Mr. Frederick Walker's drawings. It is rare to find so nearly perfect and satisfactory a story as that of *Three Sisters*, which is one to linger over, and return to with a sort of *nostalgie*.

"There is reason in all things," said Beasy; "and Honora will be at least a quarter of an hour too soon."

"Oh Beassie!" cried Honora, bursting out laughing.

"You really will. It now wants five minutes to the half-hour."

"By your watch, which is always behind time."

"The hall clock always gains."

"But what does it signify?" persisted Honora, gaily.

"My time is no object."

There are five hundred and fifty-six pages of this twaddle in *Monk's Norton*. Our time is an object, whatever Honora's may have been; and if we persist, it is not gaily. The question which will agitate some circles about *Monk's Norton*, we cannot solve. We are not sure whether it is a Sunday story. But as the rich worldly father dies of a fit while a dance is going on at his house, we think it may pass muster, even among patrons of the *Rock*.

There are so many things to be said against the practice of reading large batches of novels, that there can be no harm in dwelling for a moment on the one advantage of this form of labour. The study of contemporary fiction, like the study of everything else in an incompletely developed universe, is useful to the amateur of evolution, and of culture. One is tempted to think that the human race is making great advances on its early state, and it is salutary to be set face to face with surviving follies, and crimes that are not nearly exploded—with spiritualism, Thibetan polyandry, Lancashire ruffianism, and the mind of the common English novelist. For example, there is real discipline for the proud spirit in such a book as *Baiting the Trap*. Here is an author who introduces an old Jew miser

and dealer in *bric-à-brac*, with his lovely daughter, just as if that group still had a fresh and lively interest. Here is a specimen of the old gentleman's style of talk:—

"Holy Abraham! to think that the child of your departed pious mother should live to disgrace the birth-right which should have been for her a proud inheritance, and to stain and soil it by unlawful love gambols with Gentile dogs."

This is not a very nice way of addressing an only child, and the Jew was going on to be even more shocking and improper, "but the curse that his lips would fain have formed died away with a rattle in his throat." The fair Miriam was noted, even among her Semitic kin, for her opulent grandiosity of style. It is thus that she paints Deceit: "A young and beautiful maiden with dark hair and rich colouring, graceful in form, round in limb, velvety, soft, and downy; and for a flower type I would take a Moorish cucumber, which from its slender thread-like stems hangs its luscious-looking blood-red head." Beside Miriam, we have a velvety, soft, downy, and feline widow and intriguer; a mysterious baronet—the Gentile dog whose love gambols have been referred to; a frisky *ingénue*, some strong-minded females, and the editor of a paper which advocated the higher education of women. How they all married it were long to tell, but the *ingénue* wedded a noble lord who swore fluently in several languages. *Baiting the Trap* is a dismal novel to review, and an impossible one to read.

There are two Irish novels on our list this week, which have this point in common, that the characters are never allowed to become blue-moulded for want of a beating. Mr. Rupert Redmond, the young English hero of the fiction that bears his name, goes to live with Irish cousins in the village of Bally-crannagh. His life is a course of fighting and love-making with the sons and one of the daughters of the tenant farmers. There is a good deal of easy humour in the description of the rival clans of Devenney and M'Clatchey; in the story of the building of the village "Academy," which was completed in one day, and in the broils and bargainings of the village fairs. The author is less at home in England, and with English grammar he has only a very distant acquaintance. But his story leads the reader on, and is so unaffected that it is impossible not to feel in a state of charity with the writer. The adventures in America, where good Irishmen go while they are alive, as good Americans go to Paris when they die, are less lively than those of Charles O'Malley and Con Cregan; but Wee Micky, though not so lively, is a much more chivalrous squire than Micky Free.

Her Good Name is a tale of a very different calibre. There can be no harm in assuming that the author is a lady; no man ever drew girls so natural, and, in the case of the Miss Marauders, so nasty. The misfortune is that she has been anxious to know too much, and to depict—what Thackeray said he was not permitted to try—a man. She has been present at whatever mysteries of the male sex correspond to those of the Bona Dea; she knows how copper captains talk to barmaids, and is proficient in the slang of billiard

* Cf. the assimilateness of Fuller's reading with the mere quotation of Burton's *Anatomy*, and what a measure of difference is furnished in this alone between the men! Again: see the power of Fuller's influence across the centuries, e.g. Wordsworth owns finely that he drew his imperishable "Ecclesiastical Sonnets" from his *Church History*; and so others of mark.

rooms. This gives an air of fastness to the book which is not in the least essential to it. The girls, with one exception, are good girls, and the worst of them is not altogether unmaidenly. We should conjecture that the part of the tale which was written with the greatest pleasure is that concerned with the heroine's childhood. Her troubles begin when she leaves the home of her ruined family for the society of some rich cousins. Here she finds a lover in Philip Archer, and a bitter enemy in Kate Harborton, a dependant of the house, who has fallen in love with Mr. Archer without being asked. Kate is a very bad girl indeed: she lies, writes anonymous letters, bets, steals, and throws the blame of the theft on Elizabeth, who thus loses her lover and her good name. Archer is a weak creature, who is involved in a breach of promise of marriage case with a miller's daughter, all through the story, and who does not deserve Florence, the most amiable character in the tale. There is a web of horsey intrigue and steeple-chase talk woven all about the main thread of the plot, and we are introduced to very bad male society, where horse-whippings come off in a string, like the man-slayings in the *Njala*. Archer threatens to whip Coleman; Coleman beat Patsy; Wall beat Coleman, and so on. What puzzles us is to find any good reason for putting up a light boy of sixteen in a steeplechase where the weights averaged about eleven stone. Nor do we see how Wall, whom a loss of 45*l.* was to ruin, could bet in hundreds with strange bookmakers, without making any deposit. These improbabilities were necessary to the plot of a story which, though full of cleverness and observation, and though written in a good and quiet style, is too painful as a whole, and very disagreeable in many scenes. That the author can do infinitely better we have very little doubt. She seems to be defending a thesis that women can write about men as not without knowledge, and thus gives a false twist to her considerable natural genius.

The author of *Innocent as a Baby* requests us, on his title-page, to keep our temper with him. Now it is so very hard to do this, that we must flee from before a temptation which might prove too strong for the meekness of men. He burlesques the style of Thackeray, which is an unpardonable offence. The pleasure given by that great master has not yet been spoiled, as the pleasure of Dickens's writings has been, by imitators. *Innocent as a Baby* is imbecile as a novel, neither plot, if plot it can be called, nor automata (*characters* is not the word), have the feeblest interest, and the fluent moralisings are mere impertinences. A. LANG.

NOTES AND NEWS.

WE understand that the writer of the obituary notice of Canon Kingsley, which closes the February number of *Macmillan's Magazine*, is Sir Arthur Helps.

WE are to have this year, from Messrs. Macmillan, a History of Eton College, by Mr. H. E. Maxwell Lyte, which aims at greater completeness in an historical sense than any former book on the subject. It is expected that, beside its character as a full account of the development of an ancient educational foundation, the abundance

of new detail about the customs and rules of the place, of biographical traits and new anecdote, will prove curious and interesting to all readers. The illustrations, which will be rather numerous, are under the superintendence of Mr. Philip H. Delamotte.

THE translation of the *Aeneid* on which Mr. William Morris is engaged, is, we understand, line for line, and in rhymed fourteen-syllable metre.

A LIFE of Lord Shelburne, the minister of George III., by his great grandson, Lord Edmond Fitzmaurice, will fill up in some ways a missing chapter in English history. Papers that have turned up lately in the possession of the family throw new light on the negotiations with America that took place in Shelburne's ministry. Mr. Bancroft acknowledges his obligations to these papers in his new volume; but it did not come in his plan to use them exhaustively, as they will be used in these volumes. The first volume, taking in 1737-1763, will be published very shortly. The others may be expected before very long. Messrs. Macmillan are the publishers.

DR. LUDWIG GEIGER announces an edition of his father's scattered articles and unpublished essays. It will be completed in five volumes, the last of which will contain a minute biography of the late Dr. Abraham Geiger.

THE third volume of the *Calendar of Treasury Papers*, edited by Mr. Joseph Redington, which has been issued this week, embraces the period between the accession of Queen Anne (March 8, 1702) and the end of the year 1707. Sidney, Lord Godolphin, who played an important part in the reigns of four successive sovereigns, was Lord High Treasurer at this time, and most of the papers abstracted in this volume bear evidence of his industry and administrative capacity. As a curious instance of the attention paid by him to small items of expenditure may be mentioned a query, put at the back of a warrant for a new silver trumpet for the Duke of Marlborough's trumpeter, as to what had become of the old one. Among letters of biographical interest is one from Henry Compton, Bishop of London, to Godolphin, respecting the circumstances of Narcissus, Archbishop of Armagh. The latter "poor gentleman" is described as an excellent scholar and worthy good man, but little versed in the affairs of this world; his charitable and generous temper having left him so bare that he could think of nothing but retiring and setting up a private school for his livelihood. Two notices occur of Daniel De Foe, or Foote, as the name is sometimes written—once in a list of persons prosecuted for *The Shortest Way with the Dissenters*, and again in an order for payment, out of the secret service money, of 50*l.* to one who "did not care to appear himself" for apprehending him. That the beginning of Anne's reign did not augur much for a due encouragement of art by her advisers, is shown us by the circumstances connected with a memorial of a London merchant, one Robert Balle. With this person, it seems, a contract had been entered into, on behalf of the late King, for a supply from Italy, for 600*l.*, of seven marble statues and one marble head (among them being "Autumn, with two Satyrs at his Feet," valued at 120*l.*, and "A double statue of Pan and Orpheus," at 40*l.*). At the back of Balle's petition for payment, on King William's death, it is minuted "He may have the statues again." Great difficulties, too, were experienced by Signor Verrio, who was employed in decorating Hampton Court Palace, in getting any portion paid of the sums due to him; but this was the experience of all public servants in those days. Much other curious and instructive matter is to be gleaned from this Calendar, apart from its importance as a contribution to the general history of the kingdom.

IN the second volume of Mr. Lewes's *Problems of Life and Mind*, to appear in a few days, beside discussions of the Principles of Certitude and the logical processes by which we pass from

the Known to the Unknown, and the experiential solutions of the problems of Matter and Force, Force and Cause, and the Absolute, there is, we understand, an attempt to show that Motion is a mode of Feeling in direct opposition to the materialist conception that Feeling is a mode of Motion.

MESSRS. MACMILLAN will publish shortly a shilling primer of *Household Management and Cookery*, by Mr. Tegetmeier. Mr. Tegetmeier's former books on this subject have been designed for the use of teachers, and have, we believe, been used extensively in normal schools. This primer is for more general use, and aims at fitness even for the rawest learners.

THE number for January 15 of *Im Neuen Reich* contains three hitherto unprinted letters of Goethe which refer to Byron's intended dedication to him of his *Sardanapalus*. These letters were addressed by Goethe to his friend the Chief Librarian and Professor von Benecke, of Göttingen, who seems to have been selected, from his well-known acquaintance with English literature and his official position in the Hanoverian University city, to be the medium of communication between the British and the German poets. It would appear that Byron, having been specially gratified by Goethe's eulogistic notice of *Manfred*, was anxious to pay him a compliment by dedicating *Sardanapalus* to him; and when he forwarded the manuscript from Ravenna to his publisher, Mr. John Murray, in 1821, he sent with it the draft of the form of dedication which he wished to be submitted to Goethe for his approval before it was printed. It was as follows:—"To the illustrious Goethe a stranger presumes to offer the homage of a literary vassal to his liege lord—the first of existing writers—who has created the literature of his own country and illustrated that of Europe. The unworthy production which the author ventures to inscribe to him is entitled *Sardanapalus*." By some accident, which cannot now be explained, this proposed dedication did not come into Goethe's hands till a year after the publication of the drama, when, as these hitherto-unpublished letters show, it was forwarded to him by Professor Benecke, to whom the poet returned it on November 14, 1822, with a request that it might be sent to Mr. Murray for insertion in any subsequent edition of *Sardanapalus*. Strangely enough, this document, to which Goethe attached such importance that he caused a lithograph to be taken of it before he parted with it, was not forwarded by Professor Benecke, among whose papers it was found after his death, in the same envelope in which it had arrived by post from Weimar.

The Unseen Universe, or Physical Speculations on Immortality, is the title of a volume which Messrs. Macmillan will publish in the course of two or three months. It is said to be by two eminent physicists, and to address the two worlds of Theology and Science from a somewhat different platform from any other work of recent times.

WE hear from Bonn that Dr. Aufrecht, now Professor of Sanskrit at Edinburgh, has accepted a professorship there, and will begin to lecture at Easter.

MESSRS. RIVINGTONS announce *An English History for the Use of Public Schools*, by the Rev. J. Franck Bright. As far as can be gathered from the prospectus, it would seem to be intended to take an intermediate place between Miss Thompson's History and Mr. Green's, suitable to young people of a more advanced age than the former, and more directly drawn up with a view to school use than the latter. It is the work of five years, having been entrusted to the author by a considerable number of public-school masters. Mr. Bright has had much practical experience in tuition, which will doubtless give a special value to his book even in days when we are by no means in so deplorable a state as regards school histories as we were five years ago.

PROFESSOR W. D. WHITNEY has been giving a series of five lectures "On the Growth of Language," at the Peabody Institute at Baltimore. This is one of the foundations, for literary purposes, of the well-known philanthropist, Mr. Peabody. It keeps courses of lectures going all the winter, gives concerts of classical music, has a library of 50,000 volumes, is getting together a gallery of art, &c.

A WEALTHY Quaker of Baltimore has left nearly \$2,000,000 to be divided between a hospital and a university for that city. The latter is in course of organisation.

A MILLIONAIRE of New York, Mr. Benjamin Douglass, some time ago made up his mind that the young men of the United States ought to have a chance of studying Greek and Latin Christian authors in handy text-books as well as "the sensual frivolities of heathen poets." He accordingly gave to Lafayette College an endowment for the study of the early Greek and Latin Christian writers, and agreed to pay for a series of text-books for the class he had set on foot. He placed the general editing of the series in the hands of Professor F. A. March, LL.D., Professor of Comparative Philology in Lafayette College, and a volume of Latin hymns, and one of selections from Eusebius, have been already issued. They have been well received, and will be followed by other volumes of selections from Tertullian, Athenagoras, Augustine, Cyprian, Lactantius, Justin Martyr, Chrysostom, and others.

THE first volume of the new edition—the ninth—of the *Encyclopædia Britannica* appears this day. Among the new articles, some of the most important are—on "Acclimatisation," by A. R. Wallace; "Adulteration," by Dr. Letheby; "Actinozoa" and "Amphibia," by Professor Huxley; "The Alps," by John Ball; "Africa," by J. Keith Johnston; "Afghanistan," by Colonel Yule; "Aesthetics," by J. Sully; "American Literature," by Professor Nichol; "Alchemy," by Jules Andrieu; "Archæology," by A. S. Murray, &c.: and other articles which deserve mention are, "Analogy" and "Analysis," by Professor Croom Robertson; "Abraham" and "Adam" by Dr. L. Davidson; and "Acts of the Apostles," by Dr. Donaldson. Special attention has been paid to weak points in previous editions, such as Biblical History and Criticism, Mental Science, and Literary History; but in all departments so much new matter has been introduced that only about a fourth of the book is, even in substance, the same as the last edition.

THE great German Biographical Dictionary (*Deutsche Biographie*), undertaken by the Historical Commission of the Royal Bavarian Academy, under the auspices of L. von Ranke and J. von Döllinger, is announced as ready for publication. The editors are Baron von Liliencron and Professor Wegele, supported by about 400 contributors. The dictionary is intended for Germany, but it will include Austria, German Switzerland, the Baltic provinces of Russia, and the Netherlands, to the year 1648. It will consist of twenty volumes of about fifty sheets each, two volumes to be published every year.

THE first number has recently appeared of a new Russian periodical, printed in London, for the purpose of disseminating Socialist ideas. For some time past a journal named *Vpered*, or "Forwards," has acted as the organ of the "Russian Emigration." It has now changed its form. The books issuing from its press will continue to appear, as before, at varying intervals, but its "second and third sections" will in future take the form of a fortnightly newspaper, devoted to questions relating to "Russian life, and labour-movements in various lands." The greater part of the first number is occupied by articles upon the recent disturbances in the Russian universities.

M. WOLF communicates to the Société des Sciences Naturelles of Neuchâtel his belief that

he has established that Burgi, a Swiss, born 1552, not only discovered the isochronism of the pendulum, at least at the same time as Galileo, but that he was the first to construct, about 1580, a seconds clock regulated by a pendulum. Huyghens independently, eighty years after Burgi, gave the theory of the pendulum, and made the great discovery of the application of the pendulum as a regulator of clocks.

THE *Monitore di Bologna* states that not many days since there were discovered in the archives of Reggio thirty original letters by Guicciardini, addressed to Count Alessandro Malaguzzi. It is to be hoped they will be published by the Cavaliere P. Viani, who some years since found sixty other letters of Guicciardini, and that both discoveries will form part of a most interesting work, now about to be published by Viani, on the government of Reggio by Guicciardini. It is well known that the illustrious historian governed both Modena and Reggio in the name of Pope Leo X., and consequently this publication, enriched by the above documents, will be of the greatest use to the students of Italian history.

THE Italian papers state that Professor Florentino has discovered, in a library at Rome, a manuscript work on the Reformation, of about 200 pages, by the philosopher Campanella.

SIGNOR P. FERRATO has, as we learn from the *Nuova Antologia* for January, edited a hitherto unpublished piece by Antonio Pucci (Padova, 1874), which celebrates the taking of Padua in 1337 by M. Piero de' Rossi, then commander of the Florentine forces. Signor Ceresole adds to the rich store of knowledge which we already owe to the reports of the Venetian ambassadors, by editing a volume called *Del Governo e Stato dei Signori Svizzeri* (Venezia: Antonelli, 1874). This is a report on the condition and government of Switzerland in 1608 by Giovanni Battista Padavino, Secretary to the Council of Ten in Venice. He gives an account of the customs, the industries, and laws of the chief towns, and much valuable information about the civil legislation and military organisation of the country.

SIGNOR ANDREA TESSIER has published three interesting letters from the unpublished diaries of Marin Sanuto, under the title *Documenti tratte degli inediti Diarii de Marin Sanudo* (Venezia: Cecchini, 1874). These letters, published as part of the celebration of an illustrious marriage, have been chosen as being descriptions of three great festivities in the sixteenth century. The first describes a tournament held at Valladolid in 1518 in the presence of Charles V.; the second, the festivities at the French Court at Amboise on the occasion of the baptism of the son of Francis I.; and the fifth gives an account of the Carnival at Rome in 1519.

ACCORDING to the *Continental Herald*, the German Emperor has just presented to the Public Library of Geneva a splendidly bound copy of the works of Frederick the Great, in thirty-three volumes. The edition is that published by the Prussian Government, which is not on sale to the public.

THE reception of M. Alexandre Dumas at the French Academy is fixed for February 11. M. d'Haussonville will reply. M. Caro will probably be received by M. Camille Rousset in the course of the month of March, after which the election will take place to the chair vacant by the death of Jules Janin.

THE copyright of Michelet's works was put up to auction in Paris a few days since. The price fixed by the owners was 196,000 francs; but, there being no bid to a higher amount, in conformity with a special authorisation, bids were made diminishing in amount 10,000 francs a bid, till in the end Messrs. Michel Lévy Frères became the purchasers for the sum of 56,500 francs. To this must be added the judicial and auctioneers' expenses, and the cost of the volumes to be purchased, raising

the actual sum realised to about 100,000 francs. It should be mentioned also that the copyright of *l'Histoire de France*, *l'Histoire de la Révolution française*, *Nos Fils*, and *La Montagne*, had been previously disposed of for fifteen years for 215,000 francs.

Polybiblion states that a society has just been started at Oporto for the publication on a large scale of ancient and modern Portuguese works. Its first issue is a splendid new edition of Camoens, illustrated by Gustave Doré.

LAST month was sold at Paris the collection of drawings, books and autographs of the late Julien Boilly, the artist and learned amateur. His copies from the Italian, Flemish, and French schools sold at a fair price, 170 after Murillo, his favourite master, for 4,100 fr. The autographs were extensive and well chosen, but it was remarkable that all sovereign and political characters were excluded from M. Boilly's collection. Some of them sold at the following prices:—A signature of Bacon, 106 fr.; the same of Benserade, 50 fr.; autograph letter of Bossuet, 105 fr.; Byron, 70 fr.; Calvin, 91 fr.; Fénelon, 80 fr.; Franklin, letter to Marat, 80 fr.; Galileo, 460 fr.; Mdme. de la Fayette, 55 fr.; Montesquieu, 200 fr.; Sir I. Newton, 500 fr.; Jean Racine, letter to Père Bouhours, 575 fr.; Saint-Gelais, 21 fr.; Mdme. de Sévigné, 305 fr.; Vaucanson, 82 fr.; Vauvenargues, 351 fr.; Voiture, 50 fr. Among the artists, may be mentioned Bernini, 60 fr.; Dumoustier, 85 fr.; Géricault, 265 fr.; Palladio, 105 fr.; Germain Pilon, 200 fr.; Beethoven, 124 fr.; Mozart, 430 fr.; Rameau, 70 fr.; Schubert, 61 fr. Among the travellers, Cook, 27 fr.; Lapérouse, 20 fr.; Livingstone, 45 fr. The sale of autographs realised 18,000 fr. The books were very well sold. A copy of the five books on Surgery of Ambroise Paré (Paris: Wechel, 1572), purchased by Boilly at a book-stall for 2 fr., sold for 88 fr. The whole, 48,000 fr.

A VALUABLE paper on the history of the Mediaeval Jews of York is contributed by Mr. Robert Davies to Parts 11 and 12 of the *Yorkshire Archaeological and Topographical Journal*, which have just been issued. Other articles are: "On a Window representing the Life and Miracles of William of York," by Mr. James Fowler; and "The Monasteries of S. Hein and S. Hild," by Rev. D. H. Haigh.

WE have received Alzog's *Manual of Universal Church History*, trans. Pabisch and Byrne, Vol. I. (Cincinnati: Clarke; London: Lockwood); Gladstone's *Vatican Decrees*, trans. Oger (Bruxelles: Lebegue; London: Hachette); Cook's *Tourist's Handbook to Northern Italy* (Hodder & Stoughton); *An Elementary Treatise on the Integral Calculus*, by B. Williamson (Longmans); *The Upper Ten Thousand*, compiled by A. B. Thom (Routledge); *Music*, by H. O. Banister, Third Edition, revised (Cambridge: Deighton, Bell & Co.); *Gesammelte Werke von Adolf Stahr*, Bde. 11, 12, 13, 14, 15, "Ein Jahr in Italien," 4te Auflage (Berlin: Guttentag; London: Williams & Norgate).

NOTES OF TRAVEL.

OUR announcement that Captain Seymour would be second in command of the Arctic Expedition was premature; and we now understand that the appointment has not yet been made. Commander Markham is appointed to the Expedition, but it is not decided whether he will be second in command, or second in Captain Nares's ship. This causeless delay is most injurious to the interests of the Expedition. The lieutenants have been well selected from the pick of the navy. Lieutenants Aldrich and Giffard have served with Captain Nares, Lieutenants Beaumont, May, and Parr with Commander Markham. Lieutenant Rawson did very distinguished service in the naval brigade of the Kumaši expedition, and Lieu-

nts Fulford and Archer are known as promising officers.

It is most important that really good men of great ability and experience in the field should be selected to accompany the Arctic Expedition as scientific staff. The most essential qualification is, beyond dispute, a thorough knowledge of geology, especially in its bearings on ice action and other Arctic phenomena. The work of collecting, both as regards fauna and flora, could not be entrusted to one good naturalist; but the investigations connected with geology require the divided attention of one man of experience in the work. It is rumoured that this indispensable consideration has been overlooked in the recommendation made by the Royal Society, but appointments are not yet officially approved, and we trust that a matter on which the success of the Expedition depends will not be overlooked by the Admiralty.

A MANUAL for the use of the Arctic Expedition in course of preparation by a committee of the Royal Geographical Society. It was considered very important that the officers should be furnished with the exact state of present knowledge respecting Greenland and the surrounding seas, and what can be obtained from published works. For instance, there are many most valuable papers buried in the transactions of societies, and much information, scattered broadcast, which requires to be sought out and brought together. Admiral Collinson will, we believe, at last give the results of his careful and valuable observations during his Arctic voyage, the utilisation of which has been so long delayed, to the great regret of all who know the attainments and conscientious care always bestowed on his work that distinguished officer. Papers by Rink, Nisinger, and Wrangell will be reprinted; well as those on the physics of Arctic ice, and on the formation of fiords by Dr. Robert Brown, carefully revised; and Dr. Brown will also prepare abstracts from the valuable papers in Danish, by Dr. Rink; Mr. Markham's papers on the origin and migrations of the Greenland Eskimos; Dr. Simpson's on the Tuski; and lists of places in Greenland, with native names and meanings, vocabularies, and similar useful materials, will also be included in the Manual.

At the suggestion of the Council of the Geographical Society, a Manual having reference to geology, and to the fauna and flora, will also be undertaken under the superintendence of the Arctic Committee of the Royal Society, which is being edited by Mr. Rupert Jones, with the active assistance of Dr. Robert Brown, who has made a special study of these subjects, as regards Greenland, for many years, and has several times undertaken voyages to that country for scientific purposes.

An account of the most important geographical discovery yet achieved by any of the explorers despatched beyond the frontier of India by Major Montgomerie, will appear in the forthcoming annual report of the superintendent of the Great Indian Peninsula Railway. The journey was made in 1872, by a young man, a semi-Tibetan, who had received careful previous training. He reached the Tibetan town of Shigatze, crossed the Brahmaputra, and ascended one of its northern affluents to its source, thus ascertaining the exact position of the watershed of the Brahmaputra valley, which he crossed at an elevation of 7,000 feet above the sea. He thus reached the great lake Tengri-nor, and achieved a geographical discovery of the very first importance, for that lofty sheet of water, receiving the drainage of a vast region, has never before been visited by any explorer in any way connected with Europeans. It has long been placed vaguely on our maps, solely on the authority of the Chinese cartographers of the last century. The bold explorer was robbed by a band of thieves near the

banks of the lake, but he succeeded in reaching Lhasa, and returned safely to the head-quarters of the Great Trigonometrical Survey. His observations have since been worked out, and the results are very satisfactory. We believe that the next attempt will be to traverse the country from Lhasa, by way of the Kokonor, to Sinning in China.

LIEUTENANT CONDER has made a special survey and plan on an enlarged scale of Tell Jezer and the adjacent country, where M. Clermont-Ganneau discovered the inscriptions of the boundary of Gezer. It appears that the inscriptions are 480 feet apart in a line pointing some twelve or thirteen degrees out of the direct north-west line. They do not lie in any road or highway, which is probably the reason of their preservation. On the north and west of the Tell it is hopeless to expect to find anything, because the soil is all alluvial and ploughed over every year. No other inscription has been found in the south. The impossibility of finding a point in the Tell from which to measure distances makes it at present hopeless to use this discovery as a means of clearing up the difficulties connected with Levitical boundaries. There are in all four inscriptions, lying nearly in a line. The first two, found by M. Ganneau, have the well-known Greek and Hebrew characters; the third consists of four Arabic characters; the fourth, found by Dr. Chaplin, contains two letters only, which may be Hebrew. Lieutenant Conder's report on the whole subject is accompanied by photographs taken by Lieutenant Kitchener.

A MONUMENT has been at last erected to Captain Cook, on the spot where he was killed in Kealekua Bay (Sandwich Islands). The *Honolulu Gazette* of Nov. 25 gives the details of its inauguration. The monument consists of an elevated obelisk, with square base, in all twenty-seven feet high. It is placed at the water's edge, about two paces from the block of lava upon which the great captain was standing when he received his mortal wound. On the basement is inscribed:—"In memory of the great circumnavigator, Captain James Cook, R.N., who discovered these islands the 18th January, 1778, and was killed near this spot the 14th February, 1779. This monument was erected in November, in the year of grace 1874, by some of his fellow-countrymen."

DR. PETERMANN announces in his *Mittheilungen* that Captain Prshewalski's zoological collections, made during his journey in Kansu, Mongolia, and the Ordos country, have been bought by the Emperor of Russia for 10,000 roubles, and presented by him to the Museum of the Academy of Sciences. The collection is considered by competent judges to be a most valuable one, and it comprises some rare specimens of yaks (*Bos grunniens*), mountain sheep (*Ovis Poli*), wild asses and musk oxen, beside a varied assortment of birds and insects, the fishes being but few in number.

THE German papers announce that the expedition to Equatorial Africa, under the command of Captain von Homeyer, has left Lisbon for its destination on the Loanda coast. The Portuguese Ministry, as well as the King and his father, the ex-King Ferdinand of Portugal, have shown the greatest readiness in promoting the scientific efficiency of the intended expedition by every means in their power; and Captain von Homeyer has been officially informed that orders have been transmitted from head-quarters to the Governor-General of Angola to afford all possible protection and assistance to the German explorers, while he has received a formal exemption for himself and his companions and attendants from all duties and taxes in Loanda.

MR. H. H. ARMSTRAD, sculptor, has been elected an Associate of the Royal Academy.

THE LATE CANON KINGSLEY.

CANON KINGSLEY, who died last Saturday, was not an old man; he was only born in 1819, and yet he seems already to belong to ancient history; all his most characteristic activity was of a kind to fall more or less into the shade after the crisis which was determined by the almost simultaneous publication of *Essays and Reviews*, the *Origin of Species*, and Mr. Mill's essay *On Liberty*. "Muscular Christianity" was really a way of saying that for people who want a cheerful bracing creed it is a good thing to be Optimists, and that the most cheerful and credible form of Optimism was an anthropomorphic theism guaranteed by Christianity as understood by the late Mr. Maurice, and of course such future as it had was destroyed by the events which have made it increasingly difficult to follow the wholesome propensity of men to find an opinion true as soon as it is shown to be edifying. Perhaps the extent to which "Muscular Christianity" is to be regretted may be measured by the fact that the two works in which the theory receives the most complete and artistic expression are *Perseus and Andromeda*, and the *Water Babies*. The first, much the most musical and readable poem ever written in English hexameters, sets forth the value of anthropomorphism as an advance on Nature worship; the second is a very fresh and graceful attempt to turn science into a fairy tale and read ethical lessons into it. The best of the later novels is probably *Westward Ho!* though something might be said in favour of *Hypatia*, a very telling pamphlet in spite of its anachronisms. But Canon Kingsley will be remembered longest by *Yeast* and *Alton Locke*, the works of his "Sturm und Drang" period as "the Chartist Parson," before he had found a solution for everything. They are too bizarre to be permanently popular, but bizarre as they are, they are unmistakably powerful, and probably did much in their day to loosen the crust of callous prejudice into which the self-complacency of the comfortable classes always tends to harden. If everyone had worked as hard as Canon Kingsley to remedy the grievances which once excited him, it could not be said that he was premature in ceasing to be a revolutionist. As it was, the way that he accepted the shallow enthusiasm at the time of the Crimean War as a proof of national soundness and unity, did more credit to his generosity than his judgment. Perhaps it was a still higher proof of his generosity, as well as of his indomitable energy, that his ceasing to be in any sense a leader made no difference to his activity: beside a really beautiful study on the Hermits, published in 1867, and a pleasant boys' book based on Hereward's Saga in 1866, he wrote several volumes of Carlylese lectures on History, and several volumes of travel and popular science full of vivid pictures and wholesome counsel, to say nothing of sermons and earlier works like *Lectures on the School of Alexandria*, and *Loose Thoughts for Loose Thinkers*, a Platonic Dialogue on the thesis that Christianity is important if true; and the *Saint's Tragedy*, a touching misrepresentation of the story of St. Elisabeth of Hungary.

G. A. SIMCOX.

EXTRACTS FROM A JOURNAL KEPT AT BATH.

"1809.—The Misses Lee, the authors of *Canterbury Tales*, &c., resided at Belvedere House, Bath, where they had a school for young ladies; in it they were succeeded by the Misses Whitaker, who had been their pupils. One of the Whitakers married Mr. Broadhurst, the minister of Trim Street Chapel. Another sister married Mr. Holland, of Knutsford. Mr. Holland is father to Mr. Henry Holland, a young man of extraordinary talent, author of the *Agricultural Survey of Cheshire*, and who is now about to go to Edinburgh to complete his studies as a physician [the late Sir Henry Holland]. The Misses Lee now reside in the

neighbourhood of Piercefield. Their father is thought to have been a player; they have a brother in Yorkshire. Harriet and Sophia are living—Ann, the youngest, destroyed herself by hanging at their house in Hatfield Place, to which they retired on leaving Belvedere House.

"1814. Oct. 11.—Drank tea to-day with Mrs. Grose, a Scotchwoman—first married to Lieut.-Col. Patterson, whose portrait she has, a fine-looking military man. He published a volume of travels in the interior of the Southern part of Africa. He was at New South Wales at nearly the first settling of the colony, if not at the very first; this lady was with him. She shared with him all the misery to which the first settlers were exposed, and was afterwards with him when he was appointed to form the settlement upon Norfolk Island. She describes it as a small island, 1,000 miles from Sydney, so small that it is possible to sit in the centre and see the ocean all round. The scheme was given up, principally owing to the want of harbours and anchorage for vessels. She was afterwards with Col. Patterson when he was employed by government to form a settlement on the north side of Van Diemen's Land in Bass's Straits. Of all these settlements she has drawings and many other documents relating to them, and conveys her information in a pleasing, correct and lively manner.

"Col. Patterson died on his passage home. She married for her second husband General Grose, who had been Governor of New South Wales. This General Grose was son to the noted Captain Grose. The family came from Hanover with George I. General Grose died very suddenly soon after their marriage. Mrs. Grose is about fifty-five, and lives in respectable style in Edward Street. Our party consisted of Mr. Wright, Mr. John Godfrey Wright and Mrs. Pierson, who is a niece to the Mr. Murray who married the widow of Sir Butler Cavendish Wentworth of North Elmsall, Bart.

"Oct. 16.—Dined to-day at Mr. George Jones', a Monmouthshire gentleman, but who has lived for some time partly at Bath and partly at Arncliffe, a sweet place between Bath and Bristol. The party consisted of his own family and three or four visitors, inmates; Mr. Geebold, Mr. and Mrs. Wilkins, of the Grammar School; Major and Mrs. Hippley and Major Davis. The latter was gouty, and being in pain was not so much disposed to chat as usual, but was communicative and entertaining. It is on his account that the day comes to be mentioned here. He and Bishop Horsley married two sisters. When Horsley was made a bishop, he wished his brother-in-law to take orders. He declined, he said, for two reasons, which he plainly told the Bishop: one was the Athanasian Creed; the other the declaration that he was called of God, when it was plain to himself that he was called only by convenience. He heard one of Dr. Parr's sermons before the Lords, along with Dr. Priestley. He asked H. how he liked it, who said the beginning was good, but the conclusion d—d bad. Dr. P. said it was all good, but he thought politics were rather out of their proper place. Said Dr. P. did him the honour to invite him to Hackney to hear his farewell sermon. Lord Thurlow and Horsley first met at Lord Weymouth's. Did not believe Lord Thurlow ever read either Priestley's Tracts or Horsley's, but Dr. Wilson, his chaplain, did. Said Horsley was fitter to be a cornet of dragoons than a bishop.

"When he was a student at Woolwich, the King was present at a trial of a newly invented piece of ordnance, whose powers were dreadful. It was made by General Desaguliers. The King praised the ingenuity of the invention, but declared that so murderous an instrument should never be first used by his subjects. This Major Davis heard the King say, and in consequence of it the piece was thrown aside. He reminded his Majesty of it about six years ago, who recollected it perfectly well.

"Major Davis, then only Captain Davis, was confidentially employed by our Government in Paris, and indeed in France, to transmit intelligence concerning the French fortresses, army, &c., about the years 1788, 1789, 1790. When the Bastille was besieged, he was the person who commanded the ordnance. He saw De Launay brought out dead. The reason he was chosen for this purpose was, that no Frenchman was equal to it.

"He travelled with Mirabeau from the Hague to Berlin. He described M. as a man from whom a vast deal was to be gained. Mentioned one saying of Mirabeau's, 'Our Red Book is properly so called, for the outside blushes for the contents.'

"Who is this Princess of Salms, whom the Duke of Cumberland is to marry? is a question every one has been asking, and no one is able to answer. Major Davis gave us the history. She was of our Queen's family, and intended consort for a prince of Prussia. She came to Berlin, but that prince died before consummation. The Duke of Cumberland wished to have her. She was young and beautiful. The King his father wished the matter to be delayed. It was then it appeared that she was pregnant by a Major of Dragoons, a married man. When the King heard of it, he made the man Prince of Salms, a small town of his dominions; insisted upon his marrying the lady. The ceremony was immediately performed, and as soon as it was over he was seized by a file of musketeers who told him he was their prisoner, and that he must go to Spandau to confinement; where he ended his days, if he be dead. A divorce immediately followed the marriage on the ground of his previous engagement.

"I have since been told that it is proper to take the relations of Major Davis *cum grano salis*.

"1815. Jan. 10.—Dined *tête-à-tête* with Mr. John Gilbert Cooper. This gentleman is about sixty years of age, a handsome, gentlemanly old man. He is son to John Gilbert Cooper, author of the *Life of Socrates*, &c. He told me his father was a professed unbeliever, and even an atheist or very near it; that he was himself educated without any principles of religion, and continued till about two years ago to be without any regard to affairs of this kind. . . .

"Mr. Cooper has lived much abroad. He spent several years in France, living sometimes at St. Germain, and sometimes at Amiens. Thurgarton Priory, his Nottinghamshire seat, is in the hands of a tenant. His fortune has been injured by the extravagance of his son or sons, of whom he has two or three. He has lately had an addition to it by the bequest of a Mr. Gardiner, who has enjoind him to take that name in addition to his own. The family were originally Gilberts of Locko, and took the name of Cooper when they succeeded to Thurgarton. Mr. Cooper came to live at Bath about 1811, when he took a house in Park Street, where he had a daughter Josepha Cooper living with him. In 1813 she married Mr. Daniel Lysons, rector of Rodmarton.

"He related a curious anecdote of Bishop Watson. When Mr. Cooper was a gentleman commoner of Trinity College, Cambridge, there was a contested election in the University. As he was going up to vote at the Senate House, Watson was with him. Watson said to him, 'You see what may be done here. I came from a school in the North in blue stockings, to be a servitor—servitors, Sir, in those days used to wait behind your backs: and I am now Divinity Professor (with other offices), and by G—, they shall make me a Bishop.'"

[The epigram on the Bishop's success in procuring a public-house to be put down which was near his own, the sign of which was Bishop Blaize, is well known—

"Two of a trade can ne'er agree,
No maxim e'er was juster;
They've put down Bishop Blaize, d'ye see?
And set up Bishop Bluster."]

"Sunday, Feb. 5.—Dr. Hayward is the son of

a clergyman who had a living in Lancashire. He was many years a practising surgeon of eminence at Hackney. He gave up practice about fifteen years ago; had a diploma and resided for a short time at Taunton. Has been about ten years living at Bath. Is about seventy-six, and has now quite lost his sight. He is a man of great extent and accuracy of information, of a lively cheerful disposition. One of his sons was the Mr. Thomas Hayward who was a midshipman on board the *Bounty*, and the first person put by the mutineers into the launch. He came home with Lieut. Bligh. In 1790 he was appointed third lieutenant of the *Pandora*, sent to seize the mutineers. The *Pandora* was wrecked on her return on the north of New Holland, but the bulk of the crew after nineteen days of great suffering arrived in their boats at Timor. In December, 1796, he was appointed commander of the *Swift*, and in July, 1797, captain of the *Resistance* of forty-four guns, and in a few days to the *Trident* of sixty guns, but was lost before he joined either ship in the *Swift*. . . . Dr. Hayward's family consists of two unmarried daughters at home, Mary and Charlotte. He has many other children—one son in the Commissariat department, another in a public office at Portsmouth; one daughter is married to a surgeon at Hackney, another is the widow of Mr. Stoequeler, formerly a broker in London.

"Mr. William Henry Douce is generally of the doctor's party. He was formerly an attorney in London, and is brother to Francis Douce, F.S.A., late of the British Museum. He retired from his profession to Bath about the year 1800. He has a wife, one son and one daughter. The son is placed in the clothing business along with Mr. Nash at Tiverton. Mr. Douce has a turn for collecting books, prints, and rarities. He is about sixty, an agreeable, worthy man.

"1815. Aug. 31.—Mr. Broadhurst told me that he had lately been visiting Mr. Bowles, the sonneteer, who has a living near Calne. While there he met Mr. Coleridge, who was staying with a Mr. Morgan, of Calne. Coleridge's family are, it seems, almost wholly supported by Southey. He is himself much given to talking and to drinking. For the former some excuse may be made, for he has much to say. He talks incessantly. He has no visible means of livelihood.

"Met the same day Dr. Crawford at Mrs. Percival's. He says that Sheridan is now living, or rather drinking, in London; that Whitbread told his lady about seven o'clock on his last morning that he had passed a most uncomfortable night. She advised him to try what walking about would do for him. He got up and almost immediately cut his throat. If he had not risen earlier than was usual, the catastrophe might have been prevented.

"1816.—The whole world talks of Lord Byron; all blame him and say he has lost the only chance still afforded him of reforming his character, and being respectable and happy. Doubtless much falsehood is abroad, and among it may be the report that in a drunken fit he so far forgot himself as to strike his lady. Less problematical is it that Mrs. — the actress has succeeded to the possession of his Lordship's affections.

"1818. April 18.—Sir William Cockburn, Bart., who married the cousin and co-heiress of Sir Clement Brydges and Sir Charles Jacob, has just given me the following account of his wife's uncle, Dr. Jacob, the author of the *Peerage*—that he was brought up in terms of the closest intimacy with his relative the third Duke of Chandos (to whose father he dedicates the *Peerage*). He had a family living at Batcombe in Somersetshire, was a prebendary in the Cathedral of Rochester, and Chaplain to the King. His present Majesty promised the Duke of Chandos a bishopric for him, but after the death of his wife Dr. Jacob's conduct became dissipated and irregular, which induced the Duke to withdraw his patronage, and to decline

a mitre for his relative when the King offered to fulfil his engagement. There were rumours that Batcombe was sequestered, and the Duke determined to enquire upon the spot. Dr. Jacob was high, and refused to give the Duke any satisfactory accounts. This produced the breach; but the Duke attended Dr. Jacob's funeral, and took his three children to Chandos House, with the intention of providing for them. The eldest was a little insane; the younger had an office in the household worth one way and the other about 1,300*l.* a year, which was all his support. The sister married General Dun, and had no issue.

"1818. May 7.—Dr. Stuart Cumming, a Scotchman who has been about twenty-three years in the medical department of the army, told me that he knows for certain that the author of *Waverley* and the other romances of the same hand is Greenfield, who succeeded Dr. Blair as lecturer on rhetoric and the *belles lettres* in the University of Edinburgh. This man was guilty of a crime which makes his name odious, and escaped prosecution by flight. He has since lived in close retirement in Northumberland. His family have taken the name of Rutherford, their mother's maiden name, and Dr. Cumming tells me that he knows that 3,000*l.* was settled by the father very lately upon each of his daughters out of the profits of those works. His correspondence with the printers was through Walter Scott.

"He also told me that Wardlaw of Glasgow was originally a draper in a town in Scotland where Dr. Cumming has property; and that Dr. Chalmers was at one time an itinerant lecturer in natural philosophy and a professed unbeliever.

"1818. May 8.—Spent great part of the day with the Rev. John Skinner, rector of Camerton. Mr. Skinner, like his great namesake, has applied himself much to etymology. He is now engaged in very extensive researches after the Roman remains in his parish. The Fosse way passes through it; and in the fields on each side Roman coins have been often turned up. He has had several men at work in these fields for some time past, who have laid bare the foundations of ten or twelve Roman houses, and have discovered a great many fibulae, coins, &c. Of the latter forty or fifty a day. Yesterday they found ninety, not in hoards, but dispersed. A hoard of six-and-twenty silver coins was found. Mr. Skinner keeps an exact account of each day's discovery, with drawings of the more interesting subjects. Many specimens of Roman pottery are found. The coins are in perfect series, from Drusus and Augustus to the last of the Emperors who possessed an authority in Britain; and coins which from their rude workmanship Mr. S. conceives to have been struck by the Britons in imitation of the Roman pieces.

"It is remarkable that the foundation of one of the houses extends under the Fosse."

CORRESPONDENCE.

OUR OLDEST MANUSCRIPT, AND WHO MUTILATED IT.

Oxford: Jan. 25, 1875.

I must crave permission to make some remarks in explanation and reply to Mr. Renouf on the above. In explanation first. It is a misprint that makes me say, "Of this MS. alone, called ancient by Dionysius Exiguus." The latter clause has slipped out of place, and should have come earlier in the paragraph. What I wrote was, "That of the Prisca Versio, called ancient by Dionysius Exiguus," &c. My thanks are due to Mr. Renouf for enabling me to correct this; but then as "to the fact," which he supposes "has escaped my observation," in connexion with the date of the MS. itself, if he will be so good as to refer to my words a few lines on, he will see that I distinctly confine myself in this paper to the characteristics and contents of "*Vol. II.*" as I have called it—at any rate, that volume which alone contains the Prisca Versio. Mr. Renouf adds that I am "mistaken in talking of the Prisca Versio of the Sardinian canons." Let not Mr. Renouf be too sure of that. It is a moot question in spite of what Dionysius says—and what I have quoted him as saying, too—whether the Sardinian canons were published in Greek, or Latin, or both. The fact of their being included in the Prisca Versio rather indicates that, as they stand there, they were translated, like the rest in this volume, by its author from a Greek version. However, I am not aware that I have committed myself to anything beyond the fact that the author of this version, or at any rate the transcriber of this MS., reckons them at twenty, not twenty-one. I shall not pursue this point further now, but some day I trust to be able to convince Mr. Renouf that their genuineness in any form must be abandoned.

Next, as to Dr. Maassen. I have possessed his latest work for more than a year; and after writing my paper, carefully went through all he says about this MS. to see whether his account of it varied from my own. And the result was that I left my own unaltered. I am quite aware of the copies of the *Bibliotheca Juris Canonici* possessed by the Bodleian Library, and of the one

to which he refers in particular. But this copy contains more than Dr. Maassen gives it credit for containing, and thereby disposes of his conclusion.

Mr. Renouf says: "There is not a particle of reason for doubting the strict accuracy of Baluze's narrative." But then, in the next breath, he propounds a *theory of his own* to invalidate the very reasons which I had assigned for doubting it—"a mistake of Baluze, who confounds the MS. now in the Bodleian with another MS. of C. Justel." . . . And then: "I cannot help it if Pietro Ballerini was also misled by Baluze." Will Mr. Renouf be so good as to tell me where this other MS. of C. Justel is to be found. I have been looking them up with some care, and can find no other of his MSS. mentioned anywhere to which De Marca can be supposed to refer in either of the passages I have quoted from him, but this. Besides, this is not the *only* MS. which the Ballerini deliberately charge him with having misrepresented to their knowledge. Father Jones in the *Month* contends that the description, characterised by me as false, relates not to this MS., but to the collection. But how can this consist with the fact that De Marca doubted of the existence of such a collection till he had seen, and then only knew of in, this MS.? In conclusion, Mr. Renouf says: "The great question between the Justels and De Marca referred entirely to the rightful position of the Sardinian decrees." I admit this is the account given of it by De Marca himself; but for this we want confirmation from other quarters, it being his own truthfulness that is impeached. It was his pen that traced what the editors of the *Bibliotheca* were required to say in their preface; and of this, the part relating to the missing leaves, "*vetustate perierunt*," was absolutely false on his own showing.

EDMUND S. FFOULKES.

THE HERMIT OF RED COATS GREEN.

Belfast.

In a recent number of *Notes and Queries* Mr. Mortimer Collins says:—

"It may be interesting to note that I was told by the late George Holder that Charles Dickens employed him to see this eccentric person and report on him, and that he never himself visited him."

As this is an old story which has been going about for years, and if true would not be very creditable to the veracity of Mr. Dickens, perhaps you will allow me to state in your columns that it is entirely untrue.

There is now before me a private letter from Charles Dickens, which I copy:—

"London: Twenty-seventh March, 1862.

"My dear Mr. Finlay.

"As you sent me your paper with that very cool account of myself in it, perhaps you want to know whether or no it is true. There is not a syllable of truth in it. I have never seen the person in question but once in my life, and then I was accompanied by Lord Orford, Mr. Arthur Helps, the Clerk of the Privy Council, my eldest daughter, and my sister-in-law; all of whom know perfectly well that nothing of the sort passed. It is a sheer invention of the wildest kind.

"Faithfully yours ever,

"CHARLES DICKENS."

That I may not be said to have made unauthorised use of a private letter, I copy, from another letter of the 31st of the same month, the following passage:—

"My dear Mr. Finlay,

"Make what use you like of my note. The custom of astonishingly audacious assertion that is gradually expanding in print cannot be too decisively 'put down.'

"Faithfully yours always,

"CHARLES DICKENS."

The "very cool account" of himself was a letter from "A County Down Lady," published in *The Northern Whig* on March 24, 1862, in which she gave an account of a visit to "Tom

Tiddler's Ground" and an interview with "Mr. Mopes," the leading character in Mr. Dickens's story. The lady gave a very graphic sketch of the "Hermit," and closed with these sentences:—

"Charles Dickens offended him terribly. He pretended he was a Highlander, and Mr. Lucas at once began to question him about the country, and then spoke to him in Gaelic, which he could not reply to. Mr. Lucas said to him, 'Sir, you are an impostor; you are no gentleman.'"

This Mr. Dickens declares to be "a sheer invention of the wildest kind" (letter of March 27, 1862); and he proceeds to state the names of those who were present when he had with the "Hermit" the now famous interview.

FRANK FINLAY.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Jan. 30,	3 p.m.	Physical: Dr. A. Schuster on "Electrical Theories;" Mr. C. Baker on "An Optical Bench."
	"	Royal Institution: Mr. J. T. Wood on "The Discovery of the Temple of Diana, &c., at Ephesus."
	"	Crystal Palace Concert (Beethoven's Mass in C).
	"	Saturday Popular Concert, St. James's Hall (Bulow).
MONDAY, Feb. 1,	2 p.m.	Royal Institution: General Monthly Meeting.
	4.30 p.m.	Musical Association: Mr. C. E. Stephens on "The Fallacies of Dr. Day's Theory of Harmony."
	5 p.m.	London Institution: Professor Ferrier on "Functions of the Brain," I.

SCIENCE.

RIBOT ON HEREDITY.

Heredity; a Psychological Study of its Phenomena, Laws, Causes, and Consequences.

From the French of Th. Ribot, Author of "Contemporary English Psychology." (London: Henry S. King & Co., 1875.)

It may be affirmed with much truth that if we wish to learn what pursuit ranks highest in public opinion, we shall find it in the career of those men to whom statues are

erected by public subscription. It happened that the writer of these lines not long since revisited Cambridge, where, as he walked admiringly among the many new improvements, his eyes fell upon a recently erected bronze statue. It was the only out-of-door statue in the whole town; it occupied a commanding position in the market-place, hard by the University Church, and only a few steps from being in full sight of the Senate House. He walked reverently up to it, pondering as he went as to the manner of the man whose memory it so proudly perpetuated, and lo! it was Mr. Jonas Webb of Babraham, the famous breeder of Southdown sheep. The erection of this statue by the agriculturists of a county in whose capital a great university happens to be located, is worthy of note. It expresses their genuine appreciation of the practical application of the laws of heredity to all descriptions of farm produce, and it may be accepted as an omen that the time is near when the study of those laws and of their logical consequences shall permeate the philosophy of the university. It must do so, because there is no branch of science which refers to bodily structure or to mental aptitudes, neither is there any theological doctrine in which the theory of heredity, either directly or as one of the principal agents in evolution, can hereafter be left out of consideration.

In the course of formation of every science there has always been an embryonic or pre-scientific period. Nothing then existed but detached pieces of evidence, of an unsatisfactory kind, laxly discussed and explained by wild hypotheses. But, at length, the methods of science succeeded in catching with a firm grip some of the loose materials, then more was seized, and so, with an ever-increasing rapidity of conquest, the whole of them became gathered together within the pale of law. Heredity has at the present time developed into a science; much is definitely established, and many questions seem to require for their solution little more than direct experiment or the simple but careful collection of statistical facts. There is consequently some need of a work that shall concisely and clearly set forth what is already known, and what are the undecided questions which most urgently call for solution and might at the same time be solved by any person, who chose to devote a fair amount of intelligent and steady work to the purpose.

M. Ribot's book does not do this; it is not a work on a level with the present knowledge, but it takes us back to the pre-scientific stage of heredity. It again brings to the light old anecdotes of questionable value, and again treats with seriousness, hypotheses that have become obsolete. Speaking generally, the work is that of a partially informed and very speculative writer, and by no means that of a man of science. It is written in a somewhat pretentious style, which has the effect of making the reader believe that some great discovery is about to be announced, and of fixing his attention until he reaches the end, when the deferred hope proves never to be realised. As examples of the kind of information which he freely accepts as evidence—among the illustrations of longevity, we are told

that "a collier in Scotland prolonged his hard and dreary existence over one hundred and thirty-three years." We next have, as an example of exceedingly acute sense, a story extracted from Prosper Lucas, who was much too credulous of wonderful stories, of "Hirsch Daenemarck, a Polish Jew, who about the year 1840 travelled over Europe, showing by decisive experiments that he could read in a closed book any page or line that might be desired;" and of his son, aged ten, who "possessed this same faculty in perhaps a more remarkable degree." Curiously enough, I happen to know something about this very case, which was mentioned to me two years ago as an avowed instance of extraordinary memory. The subject of hereditary memory was and is of interest to me, and I therefore wrote to a very eminent and learned Jew, to whom I was referred for information. His reply lies before me: I do not repeat the names in his letter, as I did not ask permission to do so. This is an extract from it: "The feat to which you allude was performed by a Jewish rabbi, whose name, I think, was Hirsch Norwegen, who was popularly called the 'Sihah-Pole'—i.e., the Talmud Pole ('Sihah' being composed of the initial letters of the Hebrew words meaning 'the six sections' of the Talmud), and who, travelling through the principal parts of Europe about the year 1848, astonished even such men as—in Berlin,—in Prague, and—in Padua. He was not only able to tell the words which a pin thrust through one leaf in any part of the Talmud would pass on the next, but on any number of subsequent leaves." In fact, he had learnt the enormous work (thirty-six volumes) more or less by heart, through the aid of a local as well as verbal memory of wonderful power, devoted to that end only. My correspondent gave me particulars of another instance of extraordinary memory of the same kind that existed in his own family. His father, "when he was seven years old, could say by heart the whole of the Pentateuch in Hebrew, verse by verse, together with the remarks of the principal commentators, Farihi, Ebn Ezra, and Rashbam; and throughout life—he died aged seventy-seven—his knowledge of the vast Talmudical and Rabbinical literature was such that he was constantly appealed to for pointing out the sources of obscure references or allusions; and, in fact, he never seemed to forget anything—whether places, persons, facts, or ideas—with which he had once become acquainted." I have reason to believe that a powerful memory, exact in all matters of detail, is a characteristic of the Jewish race. M. Ribot says there is a lack of evidence to prove the heredity of strong memory; on the contrary, I find it abundant. It existed, as we have just been informed, in the family of Hirsch Daenemarck, and it exists in the family of my correspondent. But to proceed with M. Ribot's book. He quotes Le Vaillant on the half-breed children of the Europeans and Hottentots, that the moral nature is always determined by the father. When the father is a Hottentot, "the child has always the good nature and gentle and kindly affection of the father;" but, in the converse case, they have "the germs of all vices and unruly passions." (!) Again,

quotes, apparently with perfect approval, opinion "that there is an invariable connexion between the heredity of physical resemblance and the heredity of moral resemblance." I can only say that I have been so struck by the number of cases in which the child who had the features of her parent had not the character, that I could hardly be surprised if they proved to be the more numerous; but I have never as yet gone statistically into this question. When he indulges in some absurd views about likeness descending through opposite sexes, and quotes approvingly a belief that the son is more like to his mother, and, through her, to his grandfather, than he is to his father.

The inaccuracy and feebleness of his deductions is, in many instances, very striking. There is one which is perfectly inexcusable in a writer on heredity; he is speaking of the transmission of acquired habits, and uses an often published anecdote to prove his case. He says:—

"Habit is defined to be an acquired disposition. We ask if any purely individual habits are transmitted? Instances of this are cited. Girou de lauzareingues observes that he had known a man who had the habit, when in bed, of lying on his back and crossing the right leg over the left. One of his daughters had the same habit from birth."

The only meaning to be attached to this is, that the man had no special instinct to cross his legs, that from some cause or other he did so, that he acquired the habit of doing so, and that he transmitted this acquired habit by inheritance to his daughter. But what possible right has anyone to infer from the story, as it is told, that the man's habit was not just as instinctive as that of his daughter? Everybody who knows anything of heredity is well aware that one of the most interesting questions at the present time concerns the possibility of transmitting acquired habits. There are some few, very few, well-known instances of it in animals, but hardly any in man, while there are a vast number of other instances in which acquired habits are most assuredly not transmitted in any recognisable degree. The question is of extreme interest in its bearing upon the rate and direction of evolution, and therefore every bit of evidence about it deserves the closest scrutiny; but M. Ribot passes complacently on, careless and unconscious.

It is necessary to draw serious attention to the large amount of unacknowledged plagiarism which characterises this book. M. Ribot has been immensely indebted for its general design, and for very many facts, to the well-known work of Dr. Prosper Lucas, *Hérédité Naturelle*, as the reader will sufficiently recognise by comparing the two tables of contents, but I myself am aggrieved yet more directly. I find the tables and genealogies that I had compiled, after very considerable research and sifting, and which I published in *Hereditary Genius*, appropriated without a word of acknowledgment. They are clipped and condensed, and a trifling number of names are varied, but that is all, and M. Ribot thinks fit to give this plagiarised version of the families of the principal poets, painters, musicians, men of science and of literature, statesmen, and commanders, ex-

actly as if they were the fruits of his own discrimination and research. Nay worse, he mentions in three separate cases out of the whole number of them, that the genealogy of those cases was given after me, thereby implying that I had nothing to do with the rest. It is the more vexatious because he shows himself incapable of making the most of the materials he has thus conveyed to his own use, as, for example, in his tables of maternal and paternal influence, where he quotes a few cases on either side merely as anecdotes, and does not attempt to work the subject quantitatively.

The book improves towards its close, because the topics with which that portion of it deals, are more in accordance with the bent of the author's mind. He develops with effect the views that have of late become familiar to English readers, of the large part played by unconscious cerebration in intellectual acts, and in one of his best passages he ascribes genius (as I myself have lately done, in ignorance that M. Ribot had anticipated me) to a large development of that portion of the mind. He says:—

"The highest creations of the imagination spring from the unconscious. Every great inventor, artist, man of science, artificer, feels within him an inspiration, an involuntary invasion, as it were, coming out of the depths of his being, but which is, as has been said, impersonal. All that comes under consciousness is results and not processes. The difference between talent and genius is the difference between the conscious and unconscious. Artists, prophets, martyrs, mystics, all those who in any degree have felt the *furor poeticus*, have ever acknowledged their subjection to a higher power than their own *ego*, and this power is the unconscious overlapping the submerged consciousness."

The word "talent" in the above is open to objection, because it is usually understood to mean an "instinctive gift," and instinctive motives are not necessarily "conscious." The phrase ought to run "between steady brain-work and genius." I may add, that a woman's intelligence appears to have a larger proportion of the unconscious element in it than the man's, for it is notorious that she frequently arrives at just conclusions, though the only reasons she is able to assign may be eminently illogical.

Much is said in the book about free will, but nothing worthy of note is advanced. There is also an eloquent passage about the decay of the Greek genius, which is ascribed to the effects of "nature," but unhappily, the author does not even profess to understand the meaning of that phrase. He says:—

"Clearly heredity has nothing to do with this decay; but then if it is transmitted to the next generation, and if, further, the same causes go on acting in the same direction, it is equally clear that heredity in turn becomes a cause of decay."

These "ifs" and the uncertain conclusion, and the general haze that overspreads the passage, are characteristic of the author's style of reasoning.

In conclusion, I would remark, that it is usually as profitless as it is an ungracious task to pick out the defects in a man's work. Both the critic who studies it for his own information, and the reader of his criticism want, or ought to want, nothing else than to learn all of sterling worth that it contains.

But in the present instance, no choice seemed open to me but to find fault, for I laid down M. Ribot's volume after honestly reading every line of it, with a weary sense of many wasted hours.

FRANCIS GALTON.

SCIENCE NOTES.

PHYSICS.

The Theory of Mouth Organ Pipes.—The process by which the air in an ordinary mouth organ pipe is set in motion is usually represented plausibly as follows:—The current of air which issues from a narrow slit comes in contact with a sharp edge on which it breaks, producing a hissing sound which is supposed to be made up of an unlimited number of notes each with an independent pitch of its own. The air-column of the pipe selects and strengthens that particular note of the confused sound with which it can vibrate synchronously, and renders it musical. According to another view of the matter, a portion of the air which issues from the slit and strikes against the lip of the pipe is urged into the pipe, there producing a compression which reacts on the air-current and deflects it. This phenomenon is repeated periodically, the length of the air column in the pipe determining the time of a vibration. M. Sneebeil, in *Pogg. Ann.* cliii. p. 301, describes experiments which induce him to regard the production of a note in a mouth organ pipe in a different light. He considers that the air-current which issues from the slit builds there a sort of air-reed, whose action in the excitement of vibrations in the mass of air in the pipe is analogous to that of the tongue of a metal reed in an ordinary reed pipe. If the slit be adjustable and be so placed that the stream of air falls entirely on the outside of the lip, the pipe gives no sound until by pressure from without the air-formed reed is bent inwards. A similar application of external pressure is required to deflect the air-reed when the slit is so arranged that the current of air passes entirely inside the lip. In a series of letters recently published in *Nature*, Mr. Herman Smith has expressed views which appear to be in close agreement with those of M. Sneebeil.

Frigorific Effects produced by Capillarity combined with Evaporation.—Professor Decharme (*Annales de Chim. et de Phys.*, sér. v. tom. iii. p. 236) states that when a roll of bibulous paper is placed vertically with its lower extremity dipping into bisulphide of carbon, the liquid rises by capillary attraction, and after a few minutes the upper portion of the paper is covered with a layer of a white semi-crystalline substance which gradually extends downwards to within two centimetres of the surface of the liquid. The formation of this solid substance arrests the further capillary ascent of the bisulphide. The deposit was found on examination to be ice, its formation being due to the condensation of the aqueous vapour in the atmosphere, brought about by the cold resulting from the evaporation of the bisulphide of carbon over an extended porous surface. The temperature of the air at the time was 20°C., but the phenomenon was equally striking at higher temperatures, and even when the bisulphide of carbon was in a state of ebullition. When the bibulous paper enveloped the bulb of a thermometer, the temperature fell from 20° to -16°. The author proposes to employ an arrangement of this kind as a hygroscope. Water in a thin test-tube may be readily solidified in this way, the test-tube being enveloped in a roll of blotting-paper the extremity of which is dipped for a moment in bisulphide of carbon; according to the size of the test-tube and the quantity of water in it (less than five centimetres in height) will the time required for the solidification vary from two minutes to half an hour. If the bisulphide contains substances in solution (e.g., sulphur, phosphorus, etc.), the same phenomenon takes place, with this exception, however, that the deposit

now contains a certain quantity of the matter dissolved. Effects similar, though not so striking, are produced when liquids with low boiling-points other than bisulphide of carbon, and when other porous solid bodies are employed.

The Freezing of Alcoholic Liquids and Wines.—The object of the experiments of M. Melsens (of which an abstract is given in the *Annales de Ch. et de Ph.* sér. v. tom. iii. p. 527) was to settle the question, about which different opinions have been expressed by observers, whether, when wine containing 10 or 12 per cent. of alcohol is frozen, the ice produced gives, on liquefaction, pure water or an alcoholic solution. According to the decisive statement of Boussingault, the ice gives, on being liquefied, an alcoholic liquid. M. Melsens, however, regards his experiments as having conclusively proved the contrary so far as the matter is of interest for practical or industrial purposes. The wine was placed in a freezing mixture, in which it became, as a whole, semi-solid. This mass consisted of a network of ice particles of pure water imprisoned in the liquid wine, like snow impregnated with coloured water. The solid particles were separated from the liquid wine by a centrifugal force turbine. In this way a large quantity of ice particles was obtained almost colourless, even when the wine operated on was red. The liquid obtained from the fusion of this ice was without taste, contained no appreciable quantity of alcohol, and only a small amount of organic matter soluble in water. The author is of opinion that the method of congelation may be efficaciously employed to improve poor wines by separating from them pure water.

Several points connected with the freezing of alcoholic solutions, incidentally noticed by M. Melsens, are very interesting, and some of them rather startling. We are somewhat startled, for instance, at learning that not only may brandy or rum be drunk (out of a wooden cup) at a temperature of thirty or thirty-five degrees below zero Centigrade without any disagreeable sensation of cold, but that even the mellowness of the beverage improves as its temperature is reduced. A paste of brandy or rum may be made at a temperature $-50^{\circ}\text{C}.$, and is no colder on the tongue than an ordinary ice. If the temperature be pushed as low as $-71^{\circ}\text{C}.$, the effect produced is similar to that of a spoonful of soup a little too hot.

Spectra of Metallic Solutions.—In the last published number of the *Annales de Ch. et de Ph.*, Messrs. Delachanal and Mermet describe a form of apparatus (spectro-electric tube or fulgurator) for the observation of the spectra of metallic solutions. It consists of a capillary tube traversed by a platinum wire, which moves in it with sufficient freedom to allow the liquid to flow through drop by drop. The capillary tube, surmounted by a reservoir containing the solution for examination, passes through the cork of a second larger tube placed immediately below it. Through the bottom of this latter passes the second platinum wire, the extremity of which is brought within a short distance of the extremity of the upper one, while the liquid drops between the two. The advantages claimed for this arrangement are that the spark has a fixed direction, and permits the prolonged observation of constant spectra; and secondly, that the electrodes are enclosed in a tube, and the spectroscope thus secured from chance of damage. Finally, by a special arrangement, the liquid employed is collected as it drops.

The Behaviour of Iron and Steel Bars in a Galvanic Circuit.—M. Hermann Herwig's experiments on the changes in the electric conductivity of iron and steel bars brought about by the passage of voltaic currents round and through them, and on the induction currents developed, described in *Pogg. Ann.* cliii. p. 115, are instructive and suggestive. The author first quotes and discusses the experiments of Villari (*Pogg. Ann.* cxxvi. p. 120, and cxxxvii. p. 569), who found that no change in the electric conductivity of iron

rods took place in consequence of the magnetising effect of the current in the surrounding helix. Villari also observed that when a rod of iron through which a strong current had been passed was connected in a circuit with a galvanometer, and smartly struck, the galvanometer gave evidence of an induction current in the circuit, and Wiedemann showed that a similar effect is produced when the wire is twisted instead of struck. To determine the influence on the conductivity of the bar of the transversal (magnetising) currents, M. Herwig employed a modified Kirchhoff-Wheatstone Bridge. A bar of iron 170 centimètres long and 1 centimètre thick, was balanced against a copper bar 350 centimètres long, so that no current passed through the galvanometer. When now the battery circuit was suddenly broken, a strong momentary current passed through the galvanometer, the deflection of the needle being in the direction which would have been produced by a sudden diminution of the resistance of the iron. When the battery circuit was closed again, an equal momentary current in the opposite direction was produced. These were induction currents (extra-currents). With iron bars of various thicknesses balanced against the same copper bar, it was found that the thicker the bar the stronger was the extra-current. The extra-currents in the case of steel bars were much more feeble than in the case of iron, as Villari also found in his experiments cited above, the amount of difference varying with the hardness of the steel experimented on. In general with iron and steel rods, a small continuous increase of electric resistance with the continued passage of the current—more pronounced with iron than with steel—was observed. If the bars were allowed a long rest after a current had been passed through them for some time, they returned to their original state. This increase of electric resistance was observed in a great variety of cases, care being taken to eliminate changes of resistance due to changes of temperature. The direction in which the current passes through the iron or steel bars is of importance in considering the change of resistance. The resistance is greater in the direction in which the current has been passed for a considerable time than in the opposite direction. If the above experiments be tried with copper or brass instead of iron or steel, no such phenomena as those described are exhibited.

THE news just received of the complete success of the English party for observing the Transit of Venus at Rodrigues is important, as southern stations are necessarily few, the islands being thinly scattered in a wide expanse of ocean. Both ingress and egress have been well observed at this island, which is more favourably situated than Mauritius or Bourbon; and Janssen's revolver apparatus for securing photographs at the instants of contact external and internal has worked well, nine plates, each containing sixty small photographs taken at intervals of a second, having been exposed at various phases of ingress and egress, besides fifty-eight ordinary plates. The success of the British enterprise is thus secured, independently of what has been done by other nations, even though the observations at Kerguelen Island should be lost. Ingress has been observed at the Sandwich Islands and at Rodrigues, and egress in Australia (which is practically equal to New Zealand, where the observations were unfortunately lost), and in Egypt, making two pairs of stations for comparison by Delisle's method; and, what is of very great importance, the eye observations have been supplemented by a large number of measures, near the times of contact, with Airy's double-image micrometer, the success of which has been perfect. As all nations have co-operated in the great work, it is satisfactory to find that this country has done its part well, and will be able to contribute to the general result sets of observations which are complete in themselves.

MEETINGS OF SOCIETIES.

PHYSICAL SOCIETY (Saturday, January 16).

DR. J. H. GLADSTONE, F.R.S., President, in the Chair. Mr. W. H. Perkin, F.R.S., Mr. Lemann, and Mr. W. Bottomley, were elected Members of the Society. Dr. Gladstone read a paper on "The Electrolysis of Solutions of Metallic Chlorides," by himself and Mr. Tribe. The phenomena chiefly discussed were those which take place when a voltaic circuit is formed by means of platinum, a second metal, and a solution of the chloride of the second metal. With platinum, copper, and solution of cupric chloride, the result of the action was to cause a deposition of cuprous chloride upon both the platinum and the copper. With platinum, iron, and solution of ferric chloride, there was formation of ferrous chloride in contact with both metals. When mercury and solution of corrosive sublimate were used, there was similarly deposition of calomel on the mercury as well as on the platinum. With gold in place of platinum in conjunction with mercury and solution of corrosive sublimate, mercury was reduced to the metallic state in contact with the gold, and amalgam of gold was formed.—Professor Guthrie communicated the results of further experiments on crystalline hydrates formed at temperatures below $0^{\circ}\text{C}.$, a class of substances termed by him *Cryohydrates*. The experiments, of which those now communicated are a continuation, were briefly reported in the ACADEMY (see report of Physical Society's meeting on November 7, 1874). Among other results, Professor Guthrie finds that in freezing-mixtures, formed by mixing pounded ice with various soluble salts, the temperature of the mixture is, within very wide limits, independent of the proportions in which the ingredients are employed, or of the conditions under which they are mixed together. He also finds that, with very few exceptions (among about thirty salts examined), the temperature of a freezing mixture formed with a given salt is identical with the temperature of solidification of the corresponding cryohydrate; and that the lower the temperature at which a cryohydrate is formed, the smaller is the number of molecules of water contained in it in combination with one molecule of salt. Experiments on the freezing of mixtures of water and alcohol in various proportions (from 5 per cent. to 30 per cent. of alcohol by weight) showed that, for low percentages of alcohol, the depression of the temperature at which congelation begins below the freezing point of pure water is nearly proportional to the quantity of alcohol present. When dilute spirit is partially frozen, the crystals first deposited are almost pure ice, so that a concentration of spirit takes place in the portion remaining liquid; but with a mixture of four molecules of water with one molecule of alcohol (corresponding nearly to 59 per cent. water and 41 per cent. alcohol), the solidified portion and what remains liquid are identical in composition. When stronger spirit is cooled sufficiently to cause freezing to take place, the frozen part contains water and alcohol in the above proportions, and the liquid part is pure alcohol. In fact, Professor Guthrie's experiments seem to show that a definite compound is formed by water and alcohol in the proportion of four molecules of water to one molecule of alcohol, and that spirit containing more alcohol than this is a solution of this compound in absolute alcohol, while that containing less alcohol is a solution of the same substance in water. The freezing point of the hydrate of alcohol in question is $-34^{\circ}\text{C}.$ It was pointed out by Dr. Dupré, in the discussion which followed Professor Guthrie's paper, that four molecules of water to one of alcohol is the proportion in which the mixture of these substances is accompanied by the greatest evolution of heat.

ASIATIC SOCIETY (Monday, January 18).

THE Right Hon. Sir H. Bartle E. Frere, President, in the Chair. Mr. W. R. Cooper and Mr.

P. N. Narasimmiyengar, of Mysore, were elected members. Five distinguished foreign Oriental scholars, viz., Professor T. Benfey, of Göttingen, Professor R. Lepsius, of Berlin, M. E. Renan, of Paris, Professor W. Grigoryeff, of St. Petersburg, and Professor R. G. Bhandarkar, of Bombay, were elected honorary members. Mr. A. Grote presented two photographs of a beautiful Graeco-Bactrian head, belonging to General Sir W. Baker, and obtained by him from Lord Napier of Magdala (then Colonel Napier), who found it at Peshawur. The Secretary exhibited a number of impressions taken from Sanskrit inscriptions in Kotah, and recently brought home by Captain W. S. W. Muir, of the Rajpootana Agency. A brief examination showed that several of these documents were of considerable interest, supplying as they did some fresh dates and names, chiefly of Kings of Málavā. The Secretary expressed a hope that Captain Muir would supply the Society with photographs also of these inscriptions, and thereby enable them to publish them in their Journal. Professor J. Dowson read a paper on a Bactrian Pali inscription, brought home from Takht-i-Bahi by Dr. Leitner, and now in the Lahore Museum. The document consists of six lines of writing, of which the first two, containing the name of the king and the date, are alone intelligible. The king's name and title are "Maharajasa Gunu . . . pharasa" (genitive), which in *Trübner's Record* in 1871, both Professor Dowson and General Cunningham, independently from each other, referred to Gondophares. They disagreed, however, as to the date, Professor Dowson reading it as the twenty-sixth year of the king, on the seventh day of the month Vaisākha, while General Cunningham read it as the year Samvat 103 (A.D. 43), the fourth day of Vaisākha, in the twenty-sixth year of the king's reign. Professor Dowson has now taken the inscription up again, and adopts General Cunningham's interpretation of the word *samvatsara* as the Samvat era. His revised reading of the date is, "in the twenty-sixth year of the king, the year 100 of the Samvat, the third day of Vaisākha." If this is really the correct interpretation of the word *samvatsara*, the inscription would be of considerable importance, since it would show that era to have been in actual use at a much earlier period than most scholars are hitherto inclined to admit. The Report of Dr. G. Bühler on his recent examination, for the Bombay Government, of the libraries in Cambay, Limdi and Ahmedabad was then read. This brief memoir is of considerable interest to Sanskrit scholars, the examination of those collections having brought to light a number of very ancient Jaina palm-leaf manuscripts and several hitherto unknown highly important Sanskrit and Prakrit works.

NUMISMATIC SOCIETY (Thursday, January 21).

A MEETING of the Numismatic Society was held at the new rooms of the Society at 4 St. Martin's Place, Trafalgar Square, which contrast most favourably with the dingy apartments at Gate Street, and where accommodation for the library, &c., has been secured. Papers were read—(1) Written by M. J. P. Six, of Amsterdam, on a Coin of Lykkenis, King of Paonia, on which the king's name appears written thus, ΛΥΚΚΕΙΟ. M. Six further illustrated the coinage of the kings of Paonia, especially in the light of an inscription published in the *Éphéméris Archæologiké*, recording an alliance of Ketriporis of Thrace, Grabos of Illyria, and Lyppeios of Paonia, against Philip II. of Macedon. (2) By Mr. Henfrey, giving some particulars with regard to the Culloden medals.

ROYAL SOCIETY (Thursday, January 21).

THE following papers were read:—"On the Origin and Mechanism of Production of the Prismatic (or Columnar) Structure of Basalt," by R. Mallet; "On the Anatomy of the Connective Tissues," by Dr. Thim.

LINNEAN SOCIETY (Thursday, January 21).

DR. G. J. ALLMAN, President, in the Chair. Dr. Hollis read a paper on the Pathology of Oak-galls. He divided oak-galls, the species of which are very numerous, and made by a variety of insects, into two classes, the unilocular and the multilocular. To the former class belong the woody marbled oak-galls, the ligneous galls of Réaumur, and the currant-galls; to the latter the spongy "oak-apple" and the "oak-spangles" of the leaves. The author described the structure and mode of development of the different kinds, entering into some detail in the case of several instances. He expressed his belief that all the different kinds, with the exception of the "spangles," are formed during the growth of the leaf, the egg being laid in the bud. The pathological differs from the healthy development in the more rapid growth of the cells and the larger size they attain, combined with a smaller amount of differentiation. The origin of the different layers of tissue in the gall itself the author believed could be traced to the different layers of the leaf which produces it. The paper was illustrated by a splendid series of specimens from the Bethnal Green Museum, lent by Mr. A. Murray. In the discussion which followed some difference of opinion was expressed as to whether it was universal for a gall to be developed from a bud; and the President called attention to the remarkable simulation by certain galls of the fruit or other organ of the plant on which they are produced. This is a phenomenon which appears at present to admit of no explanation.

ROYAL INSTITUTION (Friday, January 22).

On the *Relations of English Wild Flowers to Insects*. By Sir John Lubbock, Bart., F.R.S., M.P., Vice-Chancellor of the University of London. The lecturer followed out in general the line adopted in his just published work on *British Flowers considered in Relation to Insects*. He commenced with a short history of the subject, referring in terms of warm praise especially to the labours of Sprengel, Darwin, and Müller. Sprengel pointed out the close relations which existed between flowers and insects, and the service rendered by the latter in transferring the pollen from the stamen to the pistil; but Darwin was the first to perceive that the importance of this consisted, not merely in the transference of the pollen from one organ to another, but from one plant to another. Everyone indeed knows how important flowers are to insects; everyone knows that bees, butterflies, &c., derive the main part of their nourishment from the honey or pollen of flowers, but comparatively few are aware, on the other hand, how much the flowers themselves are dependent on insects. Yet it is not too much to say that if flowers are very useful to insects, insects, on the other hand, are in many cases absolutely necessary to flowers: that if insects have been in some respects modified and adapted with a view to the acquirement of honey and pollen, flowers, on the other hand, owe their scent and colours, nay, their very existence, in their present form, to insects. Thus, the lines and bands by which so many flowers are ornamented have reference to the position of the honey; and it may be observed that these honey-guides are absent in night flowers, where they of course would not show, and would therefore be useless; as for instance, in *Lychnis viscaria*, or *Silene nutans*. Night flowers, moreover, are generally pale; for instance, *Lychnis viscaria* is white, while *Lychnis diurna*, which flowers by day, is red.

This transference of the pollen takes place in almost all species; but, while in most flowers it is effected by insects, in some cases it is simply caused by the wind. Wind-fertilised flowers, however, have no colour, no scent, and no honey. The self-fertilisation of flowers is provided against in three principal ways. Sometimes the stamens and pistil are situated in different flowers; some-

times they come to maturity at different times; sometimes they are so arranged that the pollen from the stamens could only reach the pistil with greater or less difficulty. In those plants in which the stamens and pistil are not mature simultaneously, the pistil in some cases ripens first, as in the *arietolochia* and arum; but in the great majority the stamens ripen before the pistil.

In illustration of the great influence which insects exercise over plants, the lecturer then called attention to those cases in which within a single genus we meet with species having large, and others with small flowers, as, for instance, in *epilobium* and *geranium*; and pointed out that the large flowers were those most dependent upon insects.

Of course these conclusions implied that insects were capable of distinguishing colours, and the lecturer then proceeded to mention some experiments which he had made, and which seemed to prove directly that this was the case. For instance, he placed some honey on a slip of glass, and put the glass on coloured paper. He then put some honey in this manner on a piece of blue paper, and when the bee had made several journeys, and thus become accustomed to the blue colour, he placed some honey in the same manner on orange paper. Then during one of the absences of the bee he transposed the two colours, leaving the honey itself in the same place as before. The bee returned as usual to the place where she had been accustomed to find the honey; but though it was still there she did not alight, but paused for a moment, and then dashed straight to the blue paper. No one, he said, who saw this bee at that moment could have had the slightest doubt of her power of distinguishing blue from orange. He mentioned one other experiment. Having accustomed a bee to come to honey on blue paper, he ranged other supplies of honey on paper of other colours, yellow, orange, red, green, black and white. Then he continually transposed the coloured paper, leaving the honey on the same spots, but the bee always flew to the blue paper wherever it might be.

Sir John then proceeded to describe a number of common flowers, and to show how beautifully they are adapted to secure and profit by the visits of insects, taking as illustrations the barberry, heath, deadnettle, salvia, sweet pea, daisy, cypripedium, &c.

He then passed on to those cases in which cross-fertilisation is secured by the relative position of the stamens and pistil; especially in the cases of primula and lythrum. He then referred very briefly to the modifications undergone by bees in order to adapt them to flowers, and after mentioning the well-known cases of the sleep of flowers, as being possibly connected with their relations to insects, and recording some observations on this part of the subject, he ended by saying that the observations commenced by Sprengel, and carried on recently by various botanists, but especially by Darwin and Müller, have shown that insects, and especially bees, have an importance in relation to flowers which had been previously unsuspected.

To them we owe the beauties of our gardens, the sweetness of our fields. To them flowers are indebted for their scent and colour, nay, their very existence in its present form. Not only have the brilliant colours, the sweet scent, and the honey of flowers been gradually developed by the unconscious agency of insects, but the very arrangement of the colours—the circular bands and radiating lines, the form, size, and position of the petals, the arrangement of the stamens and pistil—all have reference to the visits of insects, and are disposed in such a manner as to ensure the great object which these visits are destined to effect. For it is obvious that any blossom differing from the form and size best adapted to secure the due transference of the pollen would be less likely to be fertilised than others; while, on the other hand, those which were rich in honey, which

were the sweetest and the most conspicuous, would most attract the attention and secure the visits of insects; and thus, just as our gardeners, by selecting seed from the most beautiful varieties, have done so much to adorn our gardens, so have insects, by fertilising the largest and most brilliant flowers, unconsciously, but not less effectually, contributed to the beauty of our woods and fields.

FINE ART.

SIXTH WINTER EXHIBITION OF OLD MASTERS AT THE ROYAL ACADEMY.

(Fourth Notice.)

WE come to-day to an order of subjects which occupied the ancient masters little, but which occupies the modern, and especially the modern English, more than any other—that is, subjects of history and imagination not religious. To tell a story, and tell it in a moving and expressive way, has always been one of the objects of painting, and sometimes its first object. With the painters who first gave life to their art in Italy at the end of the thirteenth century, to tell the unlearned the great stories of the Old and New Testaments, and of miracles nearer their own day, was the first object. And it was the glory of that school—but above all others the glory of Giotto its sovereign—to find out what was the right way of telling a story in painting. Giotto and the early Florentine school felt that what makes a story moving and expressive in painting is not the same thing as what makes it moving and expressive in reading or recital. They felt, and acted upon the feeling, that painting dictates its own laws of composition. They saw that the actors of a painted story must before all things be so disposed as to please the eye, while at the same time they make it clear what they are about; in other words, that the painted space has to be filled with figures and groups of figures which, while they severally and all together conduct the action in a clear and noble manner, at the same time form noble and agreeable arrangements of lines and masses in various relations of balance and rhythm. Thoughts and significations the most ingenious and profound, or the most simple, may equally well lie beneath a composition so conceived; but so conceived the composition must be, or else the result will not be a picture.

To feel this, I say, and act upon it, was the glory of the Florentine school. But for a long while it was only sacred stories that painting concerned itself to tell. The demand for profane stories dates from soon after the spread of ancient learning at the beginning of the fifteenth century. By the middle of that century, a merchant of the city must needs have his daughter's marriage-quest painted with scenes from Ovid or Virgil by Pesellino or Benozzo Gozzoli. Small mythologies in tempera or oil for marriage chests, large mythologies in fresco for palace galleries and ceilings, these are the staple commissions of art other than sacred. But even by the time Savonarola rose against such things, they bore a very small proportion to the sacred art produced in Florence. In Venice, in the next century, during that sudden and mighty and prolonged climax of Venetian art, the secular and mythological phases of painting did hold a somewhat larger proportion beside the sacred and devotional phases. With the splendour of the Venetian mythologies we are familiar. There are three slight examples here. Among these, No. 126, *The Triumph of Love*, holds the first place. It is not a case of story-telling; only a baby-Cupid on a toy-lion in a landscape. It was bought, I believe, for a small sum in a sale-room last year. No hand but the master's own could have put such a quality into the landscape; the part to the right, where the lion's tail comes against the distance, has a singular resemblance to

a passage in the *Bacchus and Ariadne* of the National Gallery. The child, too, with his rosy knees and elbows, is a consummate piece of the Venetian richness in slowness; and the toy-lion is turned into something quite splendid by the style of his design, and the magic touches which bespeak the master in his eyes and the fur of his legs. No. 117 is a small copy, though a very glowing and pleasing copy, after one of the two great mythologies of the Bridgewater Gallery. The sight of it renews one's grudge against that view of an inheritor's obligations which keeps the original from public view. No. 135 is a singularly pure and lovely little romance of Tintoret's, in silvery tones. And lastly among the Italians, a Ferrarese under Venetian influence shows us an example of foolish composition and splendid colour in the scene from Ariosto (162). The fantastical, or as I repeat foolish, landscape and composition is Ferrarese, and belongs to Dosso Dossi as a member of that school; the Venetian part of him is his colour; and scutcheon and pennon and armour and marble in this interesting piece are luckily as perfectly preserved and fresh as when they were painted.

To pick up secular story-painting again in the Exhibition, one needs to come down almost to our own time. The first great English painter indeed, Hogarth, launched upon art a new order of secular story-painting, the principles of which it is well worth pains to apprehend. But there is no room for enquiring into them here, even if his early little picture of *Falstaff and Shallow* (for his I believe it is), or his other picture of *Calais Gate*, were sufficient to give us the clue (28, 37). But we can merely pause at the *Calais Gate*, for its interest in the biography and psychology of this honest bull-dog spirit, and notice the strong direct painting of it as of all Hogarth's work, and what outrageous skinny caricatures these French sentries are. Another order of story-painting flourished in English art fifty years after Hogarth—the idyllic and domestic order which had its origin in the illustration of novels and tales, and which looked to Raphael and the antique, as Hogarth had by no means looked, for hints of grace and composition. This order is represented by a couple of charming little ovals by Stothard (24, 250) and by two or three scraps of Smirke. We cannot attend at length to it either.

But the present is the great century of activity and range in pictorial story-telling. English art has concentrated itself on nothing so much as on the painting of episodes from universal history and literature. Wilkie for one, an artist of the transition between the last century and this, introduced a new and very popular art way of treating history and literature in painting. This was neither the amiable way which succeeded so well, and had such a charm as far as it went, with Stothard and the idyllists, nor the ambitious way which led Fuseli and Barry beyond their strength. It was another, a more trivial and a less artistic way. Those who followed it made their chief points of two things, costume and the picturesque for one, facial expression of the momentary kind for another. Effectively to dress and point an historical anecdote, or a scene out of a novel or a play, became the most popular task of the painter, and has remained so to our own day. A vast amount of talent has been spent, or misspent, upon the task: for the desire of dressing and pointing an anecdote or a scene, coming as it did simultaneously with that disappearance of the sense of colour of which I spoke last week, is apt to lead to a habit of mind the reverse of the artistic, and to appeal to perceptions the reverse of refined. I hold it to be indisputably true, that in the vast bulk of paintings of history or imagination which our school has yielded within the last fifty years, the proper appeal of painting by noble and agreeable arrangements of lines and colours and masses has been forgotten, and that the story has been conducted and made clear, if at all, not through these, but

through schemes of costume and gesture and facial expression sinning by a gross want of beauty and dignity, by a shallow coarseness of emphasis in humour or pathos, and by the endeavour to insist on points of the kind which it is not the business of painting to insist on. A few years ago the Royal Academy gave us the opportunity of studying the work of one of its members who was in the first half of the century the foremost master of pictorial humour, I mean Leslie. This year they give us the opportunity of studying the work of another late member, who put into the art of illustrating history and literature, as that age conceived it, the most of learning, of invention, the strongest native powers of mind, and the most determined thoroughness. The name of Maclise is justly honoured. If hard things have to be said of his art, they strike not at a memory which many still love and mourn, but at the mistaken tendencies to which he gave expression. And it is not possible to look at his fifteen paintings here assembled, and covering the interval from 1832 to 1868, without feeling that these tendencies can never come to good in art. From first to last there is the evidence of a mind which by another channel might have conveyed meanings interesting and admirable. But from first to last these are pictures, as pictures, repulsive, and (there is no good mincing it) vulgar. The series begins with the *Bottom Disenchanted* (47), of 1832. Maclise had lately come upon the town, well recommended, having cultivated in his boyhood at Cork a vigorous knack of portrait drawing; being well read, and of fine presence and manners. He made a brilliant Academy student, and was immediately successful both in society and in his art. The disenchantment of Bottom is a fair subject both for ugliness—or rather for the grotesque, the one form of ugliness which art admits—and for a theatrical play and incidence of light. But this half-naked misshapen wretch, who yawns at you till you see his uvula far down his horrid throat, is merely revolting, not grotesque; and the lights that strike upon his body, and upon the sprites flying about him and the green of the thicket, are merely broken and cutting and unpleasant. Still worse is the illustration to *Lalla Rookh* of the next year. Lord Lytton's admiration for this picture in its day is on record. I think the present generation may fairly congratulate itself on an improvement of taste. This loathsome Mokanna with the lidless glassy eyes and lipless grinning teeth would scarcely be admired to-day; nor the shrill green of the veil, nor Zelica's foolish gesture, nor the absolute want of pictorial dignity and conduct. The next year, however, shows us something very much more promising. *The Installation of Captain Rock* is one of the best products of its unlucky time. There is indeed much ugliness, and not a little extravagance of action; but then the subject allows it; an oath of vengeance sworn among a crowd of shouting Irish allows plenty of vehemence and tumult; it is even allowable that the central figure with his upraised arm should be melodramatic. And among the tumult there are plenty of incidents that are very shrewdly observed and not overstrained at all. A boy lying in the right foreground while a sinister old villain teaches him pistol-practice; the rollicking yelling couple who flourish bottle and crutch and wooden leg as they dance, these are as good in their way as possible. And there are passages of real prettiness and tenderness in the head and shoulders of the girl lying down in the left foreground, and in the woman suckling her baby on the right. Again, there is some agreeable colour, particularly in the landscape we see through the abbey window. Maclise's manner is not yet formed, and there is much to hope from such exuberant vigour and invention. But the next picture belongs to 1840, and does show a formed manner. It is the Banquet Scene from *Macbeth*; and in it the artist has arrived at many things from which he never afterwards departs. First, there is that disagreeable uniform texture,

rd leathery smoothness; with a sort of jappaned e in the high lights; and with that, the total nce of pleasurable colour, livid flesh and inky low and chilly light. Next, there is the atrical exaggeration of expression. Having ery rare power of seizing character and ex- sions, Maclise uses this with no reserve or e, but piles on the palsied abjectness and : terror of Macbeth's countenance, the imperious dness of Lady Macbeth, to a pitch of insuffer- : excess. Again, the neglect of nature: Mac- : a powerful draughtsman, and to some extent : apable designer; he is never at a loss for orous and learned attitudes and combinations attitude; but they are poured forth from what knows, not studied from what he has had re him; and sometimes the learning is a little low, and the drawing, instead of being really : rful, only has the look of power. These are s which no abundance nor ingenuity of inven- : , no scholastic thoroughness of details and : ssories, can ever make up for. The lowest at of taste is perhaps reached in the *Sleeping uly* of 1841, with its odious sugar-candy : ce, its ingenious literary invention of persons : incidents, and the inexhaustible care with : ch the furniture of the princess's boudoir and : gar trinkets of the dressing table are made out. : e highest mark is touched in the *Carton exhibit- : his Printing Press* of 1851, and the *Marriage : Eva and Strongbow* of 1854. But when all : tice has been done both in one case and the : er to the power of inventing and combining, : learning and research, the thorough working : and exactness of all the parts, and to the : ible impression of an individuality which : es its colour to everything it touches—when all : tice has been done to these, there remains the : iness, the want of pleasurable colour and tex- : e, nay of pleasurable form and distribution : , for in the forms and their distribution : re is character and energy but no charm; there : ains the vulgarity, the want of taste or retic- : e, the importunate excess of crowding, of : emence, a staginess beyond that of the stage : lf; there remains the fatal way of driving : ne the literary points of the scene or anecdote : forgetting the artistic points. The distinction : Maclise is, that where so much contemporary : ck in the same order suggests nothing but dis- : eise, the matter for praise and regret also is to be : nd in his.

SIDNEY COLVIN.

JEAN-FRANÇOIS MILLET.

E news of the death of Jean-François Millet, : illustrious French painter of landscape and : ant life, reached London too late for our last : ek's issue. He died on the 20th inst., in his : se at Barbizon near Fontainebleau, and was : ied on the 23rd in the neighbouring church- : d of Chailly, which is the burial-place also of : odore Rousseau and several other painters who : l made their home on the skirts of the forest of : ntainebleau. There has been no more single- : nded artist in modern times, nor one whose : ius was more completely the expression of his : aracter. After a few years of studentship and : periment, he devoted himself consistently, : d in the teeth of neglect and poverty, to : nt the class of men and the occupations : th which his origins had made him familiar. : is in art the poet, and at his best a poet : mirably sincere and delicate and profound, of : icultural and pastoral life as they really are in : country. Ploughed fields on a grey autumn : y, the folding of sheep by sunset or moonrise, : ing and garnering, seed-time and harvest—the : th of these things, with its grave variety in : motony, its solemn earnestness and pathos and : ience, its tranquil harmonies, had never found a : nter before. And he was to a greater or less : tent the teacher of all those who in recent : rs have followed the same path—of Jules

Breton, Ch. Jacque, and the other *peintres de la campagne* in his own country; of Mason and partly of Walker in ours.

The painter was himself by birth a peasant, born sixty years ago at Gréville near Cherbourg. He attracted the notice of the authorities at that town, who sent him to study art in Paris under Delaroche, with a pension of 1,200 francs a year. In return for this stipend he had to supply a certain number of paintings annually to the Museum at Cherbourg; and a correspondent sends us a story how the authorities complaining from time to time that the pictures he sent were too small, he one day composed for them in indignation a subject of *Moses breaking the Table of the Law*, which still exists in the Museum. The influence of Paul Delaroche might have kept a weaker pupil in the remunerative path of history and costume painting. But Millet's vocation was too strong, and after a few undecided efforts in that vein he abandoned it, and gave himself up to the painting of country life. He married early, and retired to live in a cottage in the village of Barbizon. He first exhibited in 1844. For many years he had a hard struggle against neglect and poverty, and lived with his family literally the life of a peasant. The *Semew* was among the first of his successes. A series of pictures in the same vein—*L'Angelus*, *La Tondeuse de Moutons*, *La Récolte des Pommes de Terre*, two versions of *La Charrue Abandonnée*, the picture of a sheepfold by moonlight, the *Novembre*, and others—presently established him in high reputation among the lovers of serious and original art. "Je n'aime pas les tableaux qui partent comme un coup de pistolet," he used to say: "il faut regarder longtemps mes tableaux pour en sentir l'impression." Out of a great series of the *Seasons*, upon which he had been long engaged, we believe that only the *Spring* was finished. Several of his more important works have been of late years exhibited at the Society of French Artists in Bond Street; but he has never been fully appreciated by any large section of our public. On the other hand, he has found admirers and purchasers in America.

Fame and comparative ease made no change in Millet's habits of life. He lived in his cottage at Barbizon surrounded by his children and grand-children, and known by his neighbours as the *Patriarch*. The cottage is a long low building, with one window only upon the street, and the others looking upon a garden, through which the inmates used to pass directly into the field or forest. Millet was a tall man, and in latter years very stout, with a short beard and small piercing eyes. In his studio he wore sabots and a long woollen waistcoat. The studio was very scantily furnished: a few broken chairs, a few shabby easels, some slabs in plaster from the Parthenon frieze, some old wood-carvings, a number of canvases turned to the wall, "and," adds one of our correspondents, "a piece of dried-up thistle, which he held in his hand, making me admire the delicacy of the drawing, the quiet beauty of the colour; an oyster-shell; &c." Both the dislike of official circles and the enthusiasm of friends chose to see something revolutionary in his subjects and his manner of life, but this he would not have. "On veut faire de moi un drapeau rouge," he said, "parceque je peins des paysans; mais je ne veux pas qu'on me prenne pour un mot d'ordre. Je peins les paysans parceque je suis un d'eux, parceque je connais leur vie. Je veux peindre le travail dur, sans relâche, sans récréation, le travail qui donne des ampoules et des maux de reins." He would keep by him for many years one of the pictures which most interested him, and work on it from time to time until he had finished it to his satisfaction. It will remain a kindly and reverent recollection with many, how upon the introduction of some common friend they were received by the patriarch in his painting room in the forest village, and with what simple originality and weight he would talk while he showed them his

work. "Last September," writes one of the correspondents to whom we are indebted for several of the above particulars,

"returning from a Sunday-afternoon tramp in the Fontainebleau forest, the low sun lighting up the mossy tree-trunks and the leaf-carpeted path where the children were at play, I saw just inside the forest, beneath a venerable tree, a group of ladies and artists in their forest costume, and laughing children gathered round an old man in the centre. The group was such as to recall Brion's picture in the Luxembourg of a *Protestant Service in the Wood*. As I passed in, greeting and receiving greeting, and turned again in the distance to look back at the picturesque company of the artist and his family, I little thought I had looked for the last time on Millet."

The funeral was altered from Friday of last week to Saturday; so that many friends and admirers who went down from Paris on the former day were disappointed. The body was, however, followed to the grave by a group of artists living in the neighbourhood, and a crowd of the peasants who had been the models of Millet's art, as well as by a few journalists and picture-dealers from Paris, by the President of the *Comité de Protection artistique de la Forêt de Fontainebleau*, and by an official representative of M. de Chennevières, the Director of Fine Arts.

ART SALES.

THE sale of the Flemish tapestries from the Hôtel Van Susteren-Dubois took place on the 18th inst. They were purchased by the Belgian Government for the Museum of Armoury, at the moderate price of 23,000 francs (920*l.*), 100,000 francs (4,000*l.*) being the sum at which they were estimated. The princely house on the Place de Meir from which they are derived (now in the possession of M. Osterreith) was bought in 1649 by a Milanese merchant, Giacomo Antonio Carena, who decorated it in accordance with his fortune and artistic tastes. In the great room he placed these tapestries, made to his order at Brussels, together with paintings by Rubens and Jordaens.

These tapestries are five in number, and represent scenes in the life of Achilles—Thetis plunging her Son into the Styx, his Education by Chiron, his Wrath against Agamemnon, Chryseis restored to her Father (the finest of them all), and the Death of Achilles—the whole surmounted by a border of flowers, fruits, squirrels, parrots, &c., in which the Carena arms are introduced, as also the double B, separated by a kind of escutcheon (a modification of the two B's or fusils and flints of Philip the Good of Burgundy), which are assigned by archaeologists as marks of the manufactories of Brussels.

That these tapestries are Flemish admits of no doubt, and it is equally established that they are after the designs of Rubens, who, according to Smith, made eight sketches for tapestry from the Life of Achilles for Charles I., which were sold at the dispersion of his collection; two were bought in Italy by Mr. Vernon. According to D'Angerville, Rubens executed a series of the same subject for Philip IV. of Spain. There must have been duplicates, as in 1830, copies existed simultaneously in England and France. These sketches were engraved by Ertinger in 1679 at Antwerp, and by Baron in London. They are eight in number.

The five subjects in the tapestries have been slightly modified, and some shortened, probably to keep the "giusta misura" referred to by Carena, in his will, as having been prescribed to the tapestry maker. They were executed after the death of Rubens, probably about 1655, and have never until now been removed from the hôtel for which they were originally executed. It is satisfactory to find that the Belgian Government have secured these fine specimens of their national industry for their own museum.

THE sale took place, on the 18th, at the Hôtel Drouot, of the collection of paintings of the late

M. Edwin Cliff, of St. Quentin, one of the most wealthy manufacturers of the department, who has brought the lace industry to its present perfection at St. Quentin. The paintings were mostly of the Dutch and Flemish schools, and of undoubted authenticity. *A Fishwoman*, by Jordaens and Snyders, a most important work, sold for 4,300 fr.; Ruysdael, J., *Stream Running through a Wood*, 1,820 fr.; Bergen, Van, *Shepherds and their Flocks*, 920 fr.; Berghem, *Animals in a Landscape*, 1,600 fr.; Delen, Thierry, &c., *Interior of a Palace*, 725 fr.; Franquelin, *The Departure*, 1,000 fr.; Hue, J. B., *A Calm*, 1,800 fr., and *A Tempest*, 500 fr.; Molenaer, J., *Flemish Kermesse*, 2,850 fr.; Molyn, P., *A View in Holland*, 910 fr.; Pynaker, *Animals in a Landscape*, 1,360 fr.; Vernet, C. Joseph, *A Seaport*, 1,310 fr.; Waterloo, *A Landscape*, 840 fr.; another, 790 fr.; Watteau, L., called the Watteau of Lille, *Fête Champêtre*, 1,420 fr.; Wouvermans, P., *The Sleeping Horseman*, 1,520 fr., and *The Sportsman*, 3,900 fr.; Wynants, *Landscape with Figures*, 1,520 fr.; Wynbraek, *Dutch Interior*, 920 fr.; Zorg, *The Dutch Musician*, a fine specimen of the artist, 1,080 fr. Among the modern paintings, *Cows in Repose*, by Cooper, a very important composition, sold for 3,750 fr.; Courbet, *The Roebuck*, 5,800 fr.; Isabey, E., *A Superb Landscape*, 1,650 fr.; Laugée, *The Reapers*, 2,050 fr.; Manchot, *Mosque of Kaid Bey, at Cairo*, 1,020 fr. The sale produced 74,812 fr. (2,992l. 10s.).

THE second sale of the objects discarded from the Musée Carnavalet took place this week, and produced 24,000 fr. A sledge sold for 360 fr.; two screens, 410 fr. and 355 fr.; two Louis XVI. sofas, 1,505 fr.; a bronze clock, 1,600 fr.

On the 22nd there was offered for sale at Messrs. Christie's, a portrait of Shakspeare, supposed to be the original portrait by Burbage, or Taylor the Water poet. It was formerly in the collection of Lord Lumley, of Lumley Castle, Durham, and lately passed into the possession of Mr. G. Rippen, of North Shields, and exhibited by him at the Tercentary Exhibition at Stratford-on-Avon. The portrait was valued at 100 guineas, but the public did not view it in the same light as the vendors, and it was bought in for 30 guineas.

NOTES AND NEWS.

In October, 1870, the workmen engaged in digging prior to laying the foundations of the new parish church of Saint-André, near Bruges, came upon a tomb at a depth of 3 feet below the pavement level, the walls of which were painted in distemper with figures of our Lord on the cross between St. Mary and St. John, of the Madonna, and of two angels censuring, on a ground diapered with crosses and flowers. The armorial bearings proved this to be the tomb of Sir Roger de Straten, 1335. Shortly after, two more such tombs were found, one of about the same date, the other rather earlier.

Within the last few days another tomb has been discovered in a garden adjoining the church on the south, and occupying the site of the cloister of the old Benedictine Abbey. It measures inside 6 feet 10 inches in length, by 2 feet 2 in breadth, and 3 feet in height. The coffin, the greater part of which had crumbled into dust, had been raised off the ground and supported by two rows of bricks running across the tomb. The interior of the walls is covered with a thin coat of plaster, on which are paintings in distemper still in a good state of preservation. On the eastern wall is our Lord on the cross between the Blessed Virgin and St. John; at the opposite end, a figure of a saint, unfortunately mutilated by the workmen when opening the tomb. On each of the side-walls, diapered with cinquefoils, are three large trifoliated crosses and two figures of apostles with their emblems. As a matter of course, the work is rough, the time for both designing and exe-

cuting the work having been necessarily very brief; but the figures have a good deal of character and expression, and the draperies are really well arranged. An old inhabitant of the village informed our correspondent that, some thirty years ago, a number of similarly painted tombs had been discovered on the site of the old Chapter House, but had all been demolished without any description or drawing having been made of them. Careful tracings of those recently discovered have been made and placed in the Archaeological Museum at Bruges.

AN Exhibition of Prints by Wenceslaus Hollar is now open at the Burlington Fine Arts Club, to members and their friends. The gathering includes one hundred and thirty-six prints, or sets of prints, and yet is representative of merely a small portion—though that, the most important—of the life work of one of the most indefatigable artists that ever lived. The Exhibition is formed from the collections of Mr. S. Addington, Mr. Seymour Haden, the Rev. J. J. Heywood, Mr. A. Morrison, and Mr. R. P. Roupell, Q.C., and is rendered doubly instructive by the timely issue of a catalogue with many comments on the works and a pleasant biographical sketch of the worker. Born at Prague in July, 1607, and dying in London seventy years afterwards, Wenzel Hollar's artistic career lasted nearly through the reigns of Charles the First and Second, as well as through the Protectorate, and much of the history of all that time is written in his etchings. A first glance at the work of Hollar seems, indeed, to promise an historical or antiquarian rather than an artistic interest, for the artist did not disdain to execute a map of England and a view of London many feet long—more accurate than picturesque. The artistic interest is, however, very evident on any further acquaintance. Hollar was a poor man, and could not refuse any kind of work that was offered to him. The booksellers kept him going, at poor pay. Accordingly he had not very much time, even in his long and busy life, to do whatever work he liked best. Perhaps, however, he had no personal preferences. He seems at least with well-nigh equal care to have etched illustrations for all sorts of volumes, designed frontispieces, made elaborate drawings of St. George's Chapel, copied the prints of Martin Schöngauer, and the portraits of Vandyke and Holbein, and copied sea shells and ladies' muffs, and executed symbolical figures for the Four Seasons. And in technical qualities he is unsurpassed. Often, too, he is unsurpassed in drawing; for notice the exquisite delicacy of some of his views of suburban London, or of the city itself. He is at home when sketching the neighbourhood of the Water-house at Islington—its lines of roof and half-spoiled field and low grey sky—and when jotting in, with utmost accuracy, yet with picturesque effect, the objects that were to be described far down below the battlemented top of Arundel House in the Strand. He is at home in following every possible intricacy of vaulted Gothic roof; and again he can reproduce the directness of Holbein and the grace of Vandyke. Set to chronicle a great national and dramatic event, such as the Execution of Strafford, he does not seek in the first place to make a picture so much as a record. He makes almost a *plan* of Strafford's execution: shows where everybody stood and who everybody was, and so is far enough removed in aim, as well as result, from the modern popular illustrator. But, undoubtedly, what he did generally best was anything that gave special room for the exhibition of technical mastery. Thus his sets of muffs and shells can hardly fail to be always valued. Some of his shells challenge comparison with the famous "Damier" shell, of Rembrandt—the most notable etching of still-life in existence. One thing, however, must be singled out, even in a notice brief and slight as the present one, for special remark, and that is the wholly exquisite composition, *Youth Playing a Mandolin* (No. 96 in the collection).

This little print possesses an interest greater than can possibly attach to works whose value is in purely technical skill, and its interest is not likely to be held to be less because of its immense rarity. It is so rare that it escaped the observation of Parthey, the Berlin doctor who catalogued Hollar's works, and the only two copies known to exist are the one in the British Museum and the one in the present exhibition belonging to Mr. Morrison. A youth sits near an open window. His face, if somewhat feminine, is entirely sweet and graceful; his hair falls long and thick, and is a little tumbled. He is happy with his music, and the fingers bend over the instrument they wake, with exquisite curves and delicate modelling, which not even the grace of Marc Antonio could do more than equal.

On the 22nd and 23rd were exhibited at the South Kensington Museum the works of the Society for the Promotion of Arts (S. P. A.), a society of ladies, amateur artists, who select the subjects for their drawings, which they meet twice a year to exhibit, and to give prizes, which, this time, have been awarded by Mr. Redgrave. Among the subjects for competition this year is *Colour*, well exemplified in two drawings where the same subject has been taken for illustration—the orange fungus or agaric, shown by Miss Powell, accompanied by a branch of bramble with autumnal tints; the other, by Miss Halkin, intermingled with fern—both most brilliant in colouring. Miss A. Harvey gives a good example of "colour" in a red brick house with cart and other accessories. *Water Mills* are represented with great freedom by Misses Webster, Powell and Smith. *Watching*, another subject, is variously exemplified—the Mother watching her Infant, the Sailor Family on the Look-out on the Sea-shore, the Sick Child, Hero watching for Leander, the Cat for a Mouse, &c. Among these, most notable is a life-sized portrait of an aged woman in red handkerchief, by Miss A. Smith. In *Ruins*, Miss E. Utterson gives us Porti Clais; and in *Repose* we have a most comfortable old lady knitting in perfect repose in her arm-chair, admirably drawn in "fusain" by Miss M. Buist. The exhibition is highly to the credit of the artists.

THE *Cologne Gazette* of January 25 reports the proceedings of the first meeting of the Archaeological Institute at Athens, under the presidency of the Director, Dr. O. Lüders, which took place on January 16. Dr. Lüders exhibited a drawing of a massive marble vase, which has recently been found near the Hôtel Grande Bretagne. It represents in relief two groups of figures, in one of which Hermes is seen in the act of seizing upon a woman, who with a mournful countenance looks back towards a man, who is trying to retain her hand. In the other and smaller group three other men are represented trying to rescue the woman from Hermes, who is evidently here the messenger of Pluto, come to carry the wife away from her sorrowing husband to the lower world. It is believed that this vase has formed part of a funeral monument similar to those discovered at Naples in the Villa Albani, and belonging apparently to the second or third century B.C.

M. CH. GARNIER, the architect of the New Opera House, has been decorated as officer of the Légion d'Honneur, and MM. Jourdain and Louvet, who also took part in the works of the Opera, have been created Chevaliers of the order.

EVERY student of mediæval art who has had the good fortune to visit the important collection of M. Basilewsky in Paris will be glad to learn that the owner, assisted by M. Darcel, has recently compiled a descriptive catalogue of his treasures, which he now offers to the public. To the catalogue, which contains 560 numbers, is prefixed an essay or treatise on the Industrial Arts of the Middle Ages, by M. Darcel, which contains much valuable information. The catalogue is illustrated by prints, many of them in chromolithography.

full of faults: personages are introduced who never appear before or afterwards, who are all of a conventional type, who succeed sometimes in raising a laugh, but who do so only by descending to the realms of farce. The course of the dialogue shows that Boulmier is bent upon bringing about the marriage of his daughter with Dalème at all hazards, and that Duluc is equally bent upon preventing it. Boulmier, aware of the inventor's *liaison*, has discovered the dwelling-place of Marthe, who has left Dalème for fear of compromising his future, and has begged her to give him an interview that evening at his house. Meanwhile Duluc manages to find Geneviève alone and profits by the opportunity. It seems that he has spoken much to her of his admirable friend Marthe, and she is anxious for further information. The poet upon this launches into a rhapsodical description of nature in the month of March: he describes with enthusiasm the rare glimpses of brightness from the sun, which are received with scant gratitude, although they are at work in vivifying the earth. In this speech there is some poetical feeling, which is made the most of by Porel. Duluc concludes his burst of emotion by saying, "Mon amie Marthe c'est le soleil de Mars," and then goes on to recount her history and Dalème's to Geneviève. The emotion of the girl in listening to this unexpected recital is well rendered by Mdlle. Baretta. There is much grace and there is real feeling in the look and action with which she takes the bouquet given to her by Dalème from the vase where she has kept it, and puts it away, with the words "Le soleil de Mars a passé par là." The sudden change to gaiety and carelessness on the entrance of her father is also given with just that touch of exaggeration which belongs to an assumed feeling. In the following scene between Deneuve and Boulmier, wherein the latter expresses his determination to break off the relations between Marthe and Dalème, and the course which he has determined to pursue, some fun is made by Richard out of the rather exhausted situation of an old man dwelling with vanity upon the disreputable reminiscences of his youth. Then comes the interview between Boulmier and Marthe. He has prepared to offer a large sum if she will formally renounce all claim upon Dalème. He is embarrassed by the restraint which her dignity imposes upon his vulgar nature, and after many shuffling attempts at an explanation, he finds no better way of conveying his meaning than by laying the money upon the table and explaining his meaning with a brutal plainness. Then Mdlle. Leblanc proves that she is worthy of a better part than that which M. Daryl has given her. Marthe's hardly mastered grief, her impatience at the apparently useless questioning of Boulmier, her shame and indignation when the truth bursts upon her, are interpreted with the skill and feeling of an artist. As Marthe flings the money which Boulmier has offered her upon the ground with an outbreak of scorn, Duluc and Geneviève enter. Marthe falls exhausted upon the sofa. Geneviève, divining at once who she is, rushes to console her. Duluc, on learning what Boulmier's conduct has been, is about to express his rage in a tangible form, when he is stopped by an imploring cry of "C'est mon père" from Geneviève. Marthe and Geneviève embrace, and the curtain should fall upon what is the one really effective situation in the play. The opportunity is spoilt, however, by the anti-climax of a tirade directed by Duluc against Boulmier, which he concludes by observing that he would have wreaked instant vengeance upon him—"mais une ange a prié pour vous."

This is the culminating point of the piece, and from this the last act falls off in interest, although it is infinitely better than either of the first two. It brings us back to the country house of Dalème, upon whom the ruin which has been impending is now about to break. Marthe and Duluc meet in the garden, and she explains her plans to him. She has found a place as *dame de compagnie*, and is going

to leave Dalème in order to avoid bringing upon him more trouble than she has already brought upon Duluc. He begs her to take no further step until he has seen Dalème, and when she has left him there enters a *huissier*, who has come to take stock of the house. Here again the farcical element is introduced, and with even less success than before. While the *huissier* is in the house, Dalème enters, followed by Deneuve, the banker, who implores him to marry Geneviève, in order to avoid the disgrace of bankruptcy. Dalème hesitates between his love for Marthe and his regard for his reputation, much to the indignation of Duluc. Finally Dalème goes off to find Marthe, announcing with a generosity which seems a little tardy, that he prefers her happiness to his own respectability, and then a goddess from a machine appears in the person of Geneviève. She has just come of age, and is therefore entitled to receive from her father a sum of money which is more than sufficient to extricate Dalème from his embarrassments, and to carry him to certain success. She intends that she and her husband shall invest this sum in Dalème's affairs at once. "What husband?" enquires Boulmier, who has appeared upon the scene. "He whom I have chosen," she replies, indicating Duluc. This point is marked by Mdlle. Baretta with a charming mixture of modesty and *naïveté*. It is noteworthy that Duluc himself is so little prepared for this event that he imagines Geneviève's gesture refers to Vernier, a friend who is standing close by him. Boulmier bursts into a violent explosion of rage, but is reconciled in an improbably short time to the inevitable by his daughter's caressing persuasions. Dalème enters with Marthe, having learnt the good news of her freedom; Duluc and Geneviève pair off, and the play is brought to a happy conclusion. It would be more satisfactory if the process of arriving at that conclusion were less tedious. The weight of the play is lightened by Porel, Richard, and especially by Mdlle. Baretta; but it is at times so heavy, that scarcely any exertions could make it tolerable. One comes away, it is true, with a feeling of some satisfaction; but it is difficult to determine whether the pleasure derived from the last two acts ought not to be referred to the reaction consequent on the pain caused by the first two.

WALTER HERRIES POLLOCK.

We hear that Mr. Irving has some intention of giving a reading of *Hamlet* on Ash Wednesday, but that there is at present a difficulty in getting a suitable place in which to make the experiment on that day.

We hear that Miss Amy Fawsitt will appear at the Court Theatre, in the first comedy to be produced under the management of Mr. John Hare.

The Good Samaritan is the promising title of Mr. Albery's new play, which will be produced at the Olympic Theatre directly *Two Orphans* can be withdrawn.

She Stoops to Conquer was played last Saturday morning at the Gaiety Theatre: Mrs. Kendal appearing as Miss Hardcastle and Miss Furtado as Miss Neville, and Mr. Arthur Cecil making a noteworthy success as Tony Lumpkin. Of course the bright comedy part of Miss Hardcastle presented no difficulty to Mrs. Kendal—here on the whole seen to far greater advantage than in the tearful drama of Lord Lytton's at the Globe—while the part of Miss Neville was within the range of Miss Furtado's ability. The same performance will be repeated to-day.

A *strong matinée* is promised us at the Gaiety next Saturday. *As You Like It* will be performed then, and once again a week afterwards. Rosalind will be represented by Mrs. Kendal, Orlando by Mr. Kendal, Jacques by Mr. Herman Vezin, Adam by Mr. Maclean, and Amiens, with his songs, by Mr. Cotte. Thus will be very worthily continued that series of morning performances which have

given us, even during the run of the pantomimes, something more than usually interesting and desirable to see.

MR. ARTHUR SULLIVAN is at work upon the arrangement of a new comic opera for the Royalty Theatre, and in this piece both Miss Selina Dolaro and Miss Nellie Bromley will appear. Meanwhile the little theatre will open, as we have announced, with *La Perichole*—Miss Dolaro in the leading part—and this will be preceded to-night (the opening night) by Mr. Campbell Clarke's adaptation from the French, known as *Awaking*. Mr. Rayne appears in this; and Messrs. W. Fisher and C. W. Norton are engaged together with some others—two or three of whom are, we believe, unknown to fame—at least to the fame that comes of acting opera-bouffe.

IN aid of the Cospatrik Fund, they give a special performance this morning at the Princess's, of *The Hunchback*. Mr. Ryder acts Master Walter, Mr. Terriss, Sir Thomas Clifford; Mr. A. Nelson, Modus; Miss Alleyne, Julia; and Miss Erskine, Helen.

IN a little paper in the *Era Almanack*, Mr. Clement Scott—writing on a subject which will interest many playgoers—puts in his plea for the pit; the pit which in recent years has been treated somewhat scurvily in our theatres. The pit used to be a power, and even now the most habitual and devoted playgoers probably frequent it. Mr. Scott is jealous for its privileges, for he writes:—

"Had not the position of the pit been sadly altered, had not the conditions of pit criticism been changed, had not the voice of the pit been stifled, many of the recent scandals would have been avoided, and we should not have found, as now, a kind of civil war being waged in all matters of theatrical interest—on the one side those who love the art, on the other who view it merely as a commercial speculation, or possibly something worse. Had the pit been left in its old form and strength, had this large and generous assemblage, with no piques or prejudices, been permitted to remain and watch with eager eyes over the interests of art, the difficulties of the critic would in a great measure have been removed, and all authoritative interference would have been unnecessary. That which was once done by the loud, strong, and manly voice of the people is now forced upon the representatives of the newspapers, whose opinion may be in harmony with that of the people but cannot be publicly endorsed by them. That which is now done by the distinct order of the Lord Chamberlain would, once upon a time, have been settled in a manner not quite convenient and comfortable for the manager. Let those who abolish the pit and introduce risky performances, songs, personalities, and dances, remember what a Dublin audience did when Sheridan insulted them. Let them, in connexion with other matters, remember that there are such letters in the theatrical alphabet as O. P. Let us see, however, what has been done with the poor old pit, what treatment has been extended to the honest gentlemen who, in fair weather and foul, have remained at the helm of the dramatic ship. They have been driven back, back by these ten-shillings stalls, until the place of the pit is a pen, and the pit's protection is no longer a power."

AT the Théâtre Lyrique Dramatique they have revived the *Filles de Marbre*, a five-act drama by Lambert Thiboust and Théodore Barrière.

MONSIEUR LOUIS DENAYROUZE, the writer of *La Belle Paule*, which was reviewed in the ACADEMY about eight months ago, had a fair success on the first night of his comedy called *Mademoiselle Duparc*, at the Gymnase. The main theme is more like *drame* than comedy: the comedy element is to be found in the secondary characters and episodes. *Mademoiselle Duparc* has one very strong situation, which would have gained immensely had it been naturally led up to, and led away from. Its presence, where it is not natural, is what justifies us, we think, in speaking of the work as being more nearly related to *drama* than to pure comedy, for in *drame* the effect obtained counts unmistakably as the first thing, while in pure comedy one may more legitimately demand that effect shall never be obtained at the

expense of justice of observation and accuracy of portrayal. In *Mademoiselle Duparc*, a certain countess discovers her husband coming out of the room of her governess; but being a *dévoté* of a very peculiar kind she has learned, thinks the author, to have faith in women and indulgence towards men. She does not know, and is not apparently over anxious to know, whether the governess has encouraged the advances of her husband. In real life, whether the governess had encouraged the husband or not, the governess would certainly have been asked to withdraw, for the peace of the house and its decency. But that would not only have finished M. Denayrouze's comedy as soon as it had begun; it would also have barred the way to the dramatic situation which M. Denayrouze had in store for us. So the governess is not requested to find some other place. Presently there is an evening party, at which a young man, who is somebody's secretary, recognises the governess, and reminds her, with unmatched audacity, of an old love-affair she had had, in another house. On this the governess bids him begone, and he answers that there is only one person who can tell him to go, and that is the mistress of the house. The governess crosses the stage, and says to the countess, "Madame, voici Monsieur qui m'accuse d'avoir eu un amant. Si vous le croyez, chassez-moi; si vous avez foi en ma parole, je suis chez vous—chassez-le!" And the countess, put to this test, bids her remain. Here is the situation. But some time afterwards, the count falls ill, and in his delirium murmurs no other name than that of the governess. More than that, he demands to see her, and the doctor has said, especially, that no strong wish of his must be denied. The wife will allow the governess to sit by his pillow; but her uncle positively and at all cost forbids it, and the sympathy of the audience is undoubtedly with his act. The governess rejoins the countess in the salon; the two are alone, and before the eyes of the governess the countess attempts suicide, telling Mlle. Duparc that she may be Countess de Meursolles. Mlle. Duparc prevents the suicide, and a sister from a convent conveniently coming in, she asks to be allowed to follow her. She herself will be a recluse, and the peace of the household shall be broken no longer. So the piece ends; but what does the end really settle, in the difficult relations of husband and wife? The suicide of Blanche de Chelles in the *Sphinx* was consistent with the reckless character of such a creature of impulse; and moreover, it may have made upon Mme. de Savigny's husband a lasting and wholesome impression of remorse and amendment. But what impression, one wants to know, can be made on Mme. de Meursolles' similarly placed husband by the withdrawal of this governess into a convent? Nothing is really settled. And in all likelihood, if we looked into their lives beyond the play, there would be another governess, sooner or later, and another convent, too.

MDME. FARGUEIL has appeared at the Ambigu, in *Rose Michel*, by M. Ernest Blum. Rose Michel is the wife of a villainous innkeeper, who murders a guest for money—Rose Michel seeing the deed. In time, an innocent young man is accused of the murder, and it is plainly enough the duty of Rose Michel to denounce her husband, rather than that the innocent shall die. Nor has her husband inspired her with any feeling that would prevent her denouncing him, but her child is betrothed to an honest man, keenly sensitive on points of family honour, and his abandonment of the marriage with Rose Michel's child would be the sure result of the public knowledge of the crime of Rose Michel's husband. There is a long scene in which the mother tries to see if the daughter could endure to be parted from her betrothed. But her love is too much engaged, and she can only reiterate that she should die if she lost him. All this conflict of the mother's between duty and affection—nay, sometimes between two clashing duties—makes the strength and point of the

piece. The piece, writes M. Sarcey, suffers from being written too exclusively for the actress, and Mme Fargueil suffers by the strain put upon her, and the repetition of emotions, the expression of which even her art cannot vary. But nevertheless it is agreed that the piece is a striking one, and that the power of Mme. Fargueil over her audience was never more plainly manifested. Her exhibition of art is admitted to be great, subtle, and genuine.

THE last *matinée littéraire* of M. Ballande was an occasion of unusual interest, M. Legouvé having delivered an admirable lecture on the great actor Samson, who was long one of the glories of the Théâtre Français. "M. Samson," said M. Legouvé, "a eu cette fortune bien rare de réunir en lui seul plusieurs réputations. *La Belle-Mère* et *le Gendre* et *La Famille Poisson* montrent un poète comique plein de finesse, un spirituel disciple de Collin d'Harleville et d'Andrieux. Le poème de l'*Art théâtral* semble parfois comme un dernier chant de l'art poétique. Enfin, M. Samson a laissé à la Comédie-Française une trace qui n'est pas effacée. Héritier légitime des Dugazon et des Dazincourt, il a grandement ajouté à leur héritage; il a su, avec un art merveilleux, rester valet et devenir maître, porter la livrée et l'habit brodé, passer de Scapin ou de Mascarille au comte de Rantzau, au marquis de la Seiglière, au marquis des *Effrontés*, et ces personnages nouveaux il les a si fortement marqués de son empreinte, qu'aujourd'hui encore ils gardent quelque chose de lui; quand d'autres artistes les représentent, on y entend toujours M. Samson. M. Samson comptait plusieurs jeunes filles du monde parmi ses élèves, et nul art en effet ne convient mieux aux femmes. Elles y sont même plus propres que nous. On ne voit guère de grands tragédiens de vingt ans, de grands chanteurs de vingt ans; or, la Malibran était déjà la Malibran à dix-huit ans; Mlle. Rachel a débuté à dix-neuf; Mme. Plessy a fait sensation à quinze, et Léontine Fay a fait fureur à huit. Les railleurs diront sans doute que cela ne prouve qu'une chose, c'est que les femmes sont plus naturellement comédiennes que nous. . . . Non, messieurs." Having spoken of several points characteristic of Samson, M. Legouvé continued:—"The study of diction and reading has a third advantage, for to learn to read is to learn to judge. There is nothing like reading a work aloud if you would penetrate into all its beauties, or even all its faults. M. Sainte-Beuve, coming away on one occasion from a reading-lesson of M. Samson's, uttered this pregnant phrase: 'Je viens d'apprendre qu'un grand lecteur est un grand critique.'" Many of our readers would gladly hear in London one of these lectures on literary and dramatic art which M. Legouvé knows so well how to prepare and deliver. M. Legouvé makes a short lecturing tour every spring in the north, from Paris; giving these conferences of his at Brussels and Lille; and it would be exceedingly interesting and valuable to many of us if he could be persuaded to prolong his journey and let us share the literary and artistic treat which he can give.

MUSIC.

CRYSTAL PALACE CONCERTS.—HERR WILHELMJ.

LAST Saturday's concert at the Crystal Palace was in more than one respect of special interest. Chief in importance, undoubtedly, was the first appearance at these concerts since 1866 of the virtuoso Herr August Wilhelmj. This great violinist had played on the Thursday evening previous at the Royal Albert Hall. I was unfortunately prevented from attending that concert; but my regret was materially lessened by the fact that he was announced to play the same concerto on both occasions—that by Mendelssohn in E minor. There is probably no concerto in the repertoire of violinists so familiar to the majority of our audiences as that of Mendelssohn, and there is none which affords more legitimate opportunity

of display to the player, whether as regards technical dexterity or intellectual conception. There is also none which is more frequently selected by soloists, and it therefore offers peculiar facilities for comparing the styles of various players. Within the last ten or twelve years I have had the opportunity of hearing the work from Joachim, Wieniawski, Sivori, Viouxtemps, Sainton, Mme. Norman-Néruda and Mme. Camilla Urso, and a comparison of the various "readings" would be interesting, did space permit. It is, however, better to speak of Herr Wilhelmj absolutely rather than relatively. The first and most remarkable quality of his performance, and one which on Saturday seemed to strike everybody before he had played twenty bars, is his wonderful tone. I can say without hesitation that I never remember to have heard such mingled richness, fulness, and purity of tone, whether on the highest or lowest notes of the instrument, from any violinist. Great power, especially on the violin, is often accompanied with a certain amount of coarseness—one hears more or less the scraping of the bow on the string. But Wilhelmj's tone is, to use Mozart's expression, "as smooth as oil;" at times it seemed almost to remind one of the quality of a fine oboe or clarinet rather than of a violin. With this marvellous richness is combined the most unimpeachable accuracy of intonation. The performer's mastery of the fingerboard is equal to his control of the bow; while his phrasing is broad and masterly, and free from any trace of exaggeration or sentimentalism. His reading of Mendelssohn's Concerto differed in some important respects from that adopted by most of his distinguished contemporaries; the first and last movements were taken perceptibly slower than we are accustomed to hear them. It is by no means certain that this was a disadvantage; what was lost in brilliancy was undoubtedly gained in clearness, and the minuter details of the music were presented with a distinctness such as is not often heard. It is the fashion on the Continent to compare Wilhelmj with Joachim, some critics even ranking the former the higher of the two. It is impossible to pronounce a decided opinion after only one hearing; and, moreover, while these two great artists have much in common, they have also differences which make a comparison extremely difficult. As regards quality of tone, the palm must undoubtedly be given to Wilhelmj; in absolute mastery of the technique of the instrument, there is probably nothing to choose between the two; while they also closely resemble one another in perfect freedom from exaggeration, and the absence of what Germans so expressively call "Effekthascherei"—straining after effect. But whether Wilhelmj possesses in the same degree as Joachim that power which in the playing of the latter constitutes the greatest charm—the power of throwing himself so completely into the spirit of whatever he plays that one thinks not of the performer but solely of the music—is a question which can only be answered after repeated hearings. It is enough now to say that Herr Wilhelmj's first appearance was a brilliant and fully deserved success. In his two short solos later in the concert—arrangements by himself of an air by Bach and a nocturne by Chopin, he fully confirmed the impression he had already produced.

In addition to the appearance of Herr Wilhelmj, the concert of Saturday was interesting from containing in its programme a symphony by one of the first living English musicians. This was Sir W. Sterndale Bennett's symphony in G minor, which had only once previously, (on March 5, 1870) been given at the Crystal Palace. This work, the only published symphony of its author, was written for the concerts of the Philharmonic Society, where it was produced during the season of 1864. It at that time (like Schumann's "Overture, Scherzo and Finale") consisted of three movements only, but was subsequently completed by the addition of the charm-

ing Romanza which now precedes the final Rondo. Like all Bennett's compositions, it is characterised rather by melodious grace and exquisite finish than by grandeur or breadth of style. The first movement is throughout extremely pleasing; but the second and third are the gems of the work. The former is one of those quaint old minuets, in slow time, which are by modern composers almost always discarded in favour of the more brilliant scherzo. The delicate grace of the daintily-tripping principal theme reminds one of the old ballet-airs of the last century; and the trio, written for the brass instruments alone, is the more effective as these instruments, with the exception of two horns, have been entirely suppressed during the earlier part of the movement. The third movement, the Romanza already mentioned, is a very graceful "song without words" given to all the violas. It is but seldom that this valuable department of the orchestra has any opportunity for special display. Most composers use the viola merely to complete the harmony. Among the great masters Mendelssohn is almost the only one who seems to have appreciated the capabilities of the instrument. To quote but one example of many which will occur to those acquainted with his scores—the beautifully subdued and yet rich tone-colour of the accompaniment to the song "Lord God of Abraham," in *Elijah*, arises from the fact that the melody is almost entirely given to the violas, instead of (as usual) to the violins. In the present Romanza the effect of their employment is no less charming; and a word of special praise ought, in passing, to be given to the gentlemen who played those instruments on Saturday for the really admirable way in which they did justice to the music. The finale of the symphony is the least important portion, and, though full of pleasing matter, calls for no special comment. The performance of the entire work was worthy alike of the music, the band and the conductor.

The concert commenced with Cherubini's overture to *Les Deux Journées*, with respect to which it is necessary to make a protest which I have never before had to make regarding any performance at the Crystal Palace. Who on earth was responsible for those additional brass parts which were played on Saturday? Cherubini's score contains only three horns and a bass trombone. Beside these there were introduced two trumpets and alto and tenor trombone, the result being that in the *forte* passages the brass overpowered everything else, and the effect was simply distressing. Mr. Manns is such a conscientious conductor that it is impossible to conceive that he was responsible for the alteration; still it was an incomprehensible one. The concluding piece was Beethoven's great *Leonore* (No. 3) overture.

The vocalists were Mdle. Johanna Levier and Mr. Sims Reeves. The lady sang the air "Ach, ich fühl's," from the *Zauberflöte*, and two songs by Mendelssohn ("Frühlingslied," Op. 71, No. 2) and Schumann ("Der Nussbaum"), fully confirming the favourable impression produced by her on her previous appearance at the Albert Hall; while Mr. Sims Reeves gave the beautiful song "Refrain thy voice from weeping," from Sullivan's *Light of the World*, and Schubert's "Ave Maria," the latter a strange choice for a tenor!

This afternoon Beethoven's Mass in C will form the principal attraction, and Brahms's variations on a Theme by Haydn will also be repeated.

EBENEZER PROUT.

At the last Monday Popular Concert Mdle. Krebs was again the pianist. She selected as her solo Beethoven's Sonata in D, Op. 10, No. 3, and also played, with Mdme. Norman-Néruda, Mozart's beautiful, though somewhat old-fashioned Sonata in G for piano and violin, and, with the same lady and Signor Piatti, Chopin's piano trio in G minor—this last named work being produced on this occasion for the first time at these concerts. Like most of Chopin's larger works, this trio is inferior

to his nocturnes, mazurkas, and other pieces cast in smaller moulds. The very difficult and brilliant piano part was played to perfection by Mdle. Krebs, who seems equally at home in all styles. The quartet which opened the concert was Haydn's in G, Op. 54, No. 2, which was given with great effect by Mdme. Norman-Néruda, Messrs. Ries, Straus, and Piatti, the minuet being encored. Miss Antoinette Sterling was the vocalist.

THE Royal Albert Hall concerts were resumed on Thursday week with a grand orchestral performance. The special feature of the evening was the first appearance for several years of Herr Wilhelmj. Of this gentleman we have spoken above; and, as our reporter was unable to attend this concert, we must content ourselves with mentioning that the chief orchestral works produced were the "Pastoral" symphony, the overtures to *Guillaume Tell* and *St. John the Baptist*, and Wagner's "Kaisermarsch." On Tuesday evening *Israel in Egypt* was given. The next of these concerts is to take place this evening (Saturday) and will be a Popular Ballad night. Mdle. Levier, Miss Antoinette Sterling, Mr. Sims Reeves (who is to sing Blumenthal's "Message," and a serenade by Berthold Tours) and Mr. Whitney are the vocalists; and Herr Wilhelmj, who created so great an impression on his reappearance last Thursday week, is to play a Concertstück by Dr. Hiller, for the first time, and a Chaconne (for violin alone) by Bach. Part-songs and madrigals by the Part-Song Choir of the Royal Albert Hall Choral Society, under the direction of Mr. Barnby, complete a very interesting programme. The next orchestral concert will take place on Tuesday, February 2, when several important orchestral pieces (notably Mendelssohn's Italian Symphony) will be performed. Herr Wilhelmj is to play a concerto by F. Hégar, for the first time, and his own arrangements of Wagner's "Albumblatt," and Chopin's "Notturmo." Mdle. Johanna Levier and Mr. Sims Reeves are to be the vocalists. The concert will be conducted, as usual, by Mr. Barnby. It is to be hoped that on this new system this excellent enterprise will receive the support which it well deserves.

MONDAY last being the Feast of the Conversion of St. Paul, a special musical service was given in the afternoon, in accordance with the precedent of the last few years in St. Paul's Cathedral. The choir was largely increased, and a full orchestra engaged. The anthem consisted of a large selection from Mendelssohn's *St. Paul*, commencing with the scene of the conversion, and comprising in all the latter half of the first part, and a considerable portion of the second part of the oratorio. Thanks to the joint efforts of the organist, Dr. Stainer, and the authorities of the Cathedral, the orchestra seems now to have become an established institution on festival occasions in St. Paul's.

A CORRESPONDENT from Glasgow informs us, *à propos* of the orchestral concerts at present in progress in that city, that last Monday there was to be a grand "Wagner" night, for which Dr. Bülow was engaged as solo pianist and conductor. The programme included Schumann's First Symphony, Beethoven's E flat Concerto, Liszt's Hungarian Fantasia, the overtures to *Euryanthe* and *Tannhäuser*, and Wagner's "Huldigungsmarsch" and "Kaisermarsch." The same programme, with the same band and conductor, is to be subsequently repeated at a concert of the Edinburgh Choral Union.

THE recent success of Handel's music in Paris is directing the attention of musicians in that city to the history of the art in this country, in which all his greatest works were produced. The last number of the *Revue et Gazette Musicale* contains the first of a series of articles by M. Octave Fouque, entitled "Les Précurseurs de Händel; Coup d'œil sur l'histoire générale de la musique en Angleterre du XVI^e au XVIII^e siècle."

THE committee for the erection of a monument to Auber in Paris have bought a site for that purpose in the cemetery of Père-la-Chaise, at the cost of 6,300 francs. The municipality was unable to present them with the ground, as they have no power to make such a concession except in favour of those who have rendered special services to the city of Paris.

THE *Neue Zeitschrift für Musik* states that both Gade and Brahms have promised large works for the next Birmingham Festival, which takes place in 1876.

According to the Bayreuth *Tagblatt*, the preparations for the representation of *Reinhold Wagner's* national piece, *The Ring of the Nibelungen*, are so far completed that the times of the rehearsals and the date of the festival itself have been fixed. It is announced that the first rehearsals for the vocal parts will be held on pianoforte accompaniments weekly in the week of next July, when the four main divisions of the works, viz., *Rheingold*, *Die Walküre*, *Siegfried*, and *Götterdämmerung* will be taken separately and in succession. The same parts will be rehearsed early in August, while it is expected that the more difficult scenic representations will be sufficiently developed to admit of their being tested by the end of the month. The final complete rehearsals will not take place till June and July, 1876; and in accordance with the present programme the first definite public representations will be held in the first week of August 1876, in the following order: Sunday, at 4 p.m. the *Rheingold* will be given; Monday, *Die Walküre*; Tuesday, *Siegfried*; and Wednesday, *Götterdämmerung*. Each act is to be followed by a long interval, for the rest and refreshment of the audience and performers, the latter having pleasant gardens and covered-in summer-houses specially provided for them. The whole course of the representation is to be repeated in the latter week of August, beyond which the committee have not yet made known their plans.

THE *Kölnische Zeitung* announces that on March 17 next, the first part of Wagner's *Wallenstein* will be given at Cologne, under the direction of the Wagner Verein, who are at present busily engaged in completing the necessary preliminary arrangements.

LITERATURE.

Recollections and Suggestions, 1813-1873.
By John Earl Russell. (London: Longmans & Co., 1875.)

(Second Notice.)

LORD RUSSELL had the good fortune to have travelled in Spain and visited the headquarters of the Duke of Wellington before he entered Parliament, and to begin his public life at a period when he was no longer likely to be affected by the fatal fallacy which had so deeply compromised the Whig party, and neutralised its just claims on popular support. The notion that Bonaparte was the "child and champion of the Revolution," and that the aggressions of the Empire were in some degree connected with, and justified by, the philanthropic ideas of the great European convulsion, however pardonable in France until the History of M. Lanfrey and the fall of the Vendôme Column, is one of the strongest instances how party feeling can maintain an erroneous impression once implanted in honest minds. And it may be that his recollection of the outburst of national independence at that moment may associate itself with the unqualified admiration with which he regards the Germany of to-day, and on which he believes the best hopes of Europe and the wisest policy of England to rest. It is thus that his views of foreign policy have been consistently far-seeing and liberal, and though, no doubt, he lectured foreign governments too much in a professorial tone, he kept himself above any such personal feeling as induced Lord Palmerston to find satisfaction in the fall of the Orleans dynasty, and to regard with comparative favour the rise of the Second Empire, until undeceived by the annexation of Nice and Savoy. It shows, indeed, his ardent confidence in the liberal future of Europe, that Lord Russell's reminiscences of the oppression of the Holy Alliance do not inspire him with any anxiety as to the result of the union of Germany, Austria, and Russia, "banded together in spirit, if not in form." The interesting, and to most of us novel fact, that before the war of 1870 Prussia had an understanding with Russia to use force, if necessary, to prevent Austria from rendering assistance to France, will increase, if it is possible to do so, the astonishment of the historian at the blindness of French diplomacy. And when Lord Russell expresses his trust that England will defend either Holland or Belgium against any unprovoked aggression, he hardly seems to take into account the magnitude of the forces which

she may have to encounter. It would have been expected from his general censure of Mr. Gladstone's conduct of foreign affairs that he would have spoken with reprobation of Lord Granville's revision of the Treaty respecting the Russian ports and the Black Sea; but his sense of the impolicy of inflicting that humiliation on Russia, which was shared by other statesmen and doubtfully approved by Lord Palmerston himself, has made him overlook the inopportunities of the demand, to us at the least uncourteous, and to France most cruel in the hour of her defencelessness and despair.

It is on the questions of the policy of England towards Ireland and of National Education that Lord Russell is most explicit in his suggestions. On both these grave matters he has a full right to speak, and even to teach, for they have been in his thoughts through his whole Parliamentary life, and have affected his political fortunes. Thus, though in his statement of either case there is nothing very new beyond the precision of the ideas and the epigrammatic turn of the expression, the very definite conclusions at which he has arrived have both an individual and general interest, and if the remedies he proposes seem impracticable to us, it does not at all follow that they do so to a statesman who has always looked on his superiority to circumstances as the chief pride of his career.

It must have been a day of justifiable satisfaction to the mind of Lord Russell when the Royal Assent was given to the disestablishment of the Irish Church. His imagination must have taken him back to the time when the most moderate reform of that institution had been regarded as a sacrilege, and when the proposal to transfer some of the revenue of the Church to general purposes of education was urged by himself, Lord Althorp, and Lord Durham, on the Cabinet of Lord Grey, and urged in vain;—to the time when his own increasing influence carried forward the principle of Appropriation, to the extrusion from the Government of Lord Ripon, Mr. Stanley, Sir James Graham, and the Duke of Richmond, the first of these maintaining

"that if the revenue of the Church in a particular parish was to be regulated by the number of the Protestant population in that parish, then the principle on which alone the Established Church existed was destroyed;"—

and so onwards to the later date when he overthrew the Government of Sir Robert Peel on the Appropriation Clause. Upon this subject there are two sentences in different parts of this volume which deserve consideration. The first is the expression of the belief that

"if this contest had been continued in every session for some forty years, it is probable that little progress would have been made, that parties would have been marshalled against each other every year, and that popular interest on the subject would have languished, and perhaps have perished."

Is this very inconclusive proposition intended as an argument, it may be excuse, for the coldness of the Liberal party on this question for so many years, and for its relegation from Parliamentary discussion after it had caused a change of Administration?

Perhaps the real result is to be found in the later passage where, after stating that—

"to have quietly removed the most odious and offensive emblem of the corruption and the intolerance of England, the target against which the arrows of Ireland's best archers were always aimed, without disorder, without riot, is a great feat in the history of any statesman;"

he adds:—

"The attempts to remedy this portentous injury without extinguishing the Church, to turn the curse into a blessing, were sure to prove, as Lord Althorp, Lord Durham, and I contended in Lord Grey's Cabinet they would be in 1833, stupendous failures."

How far Lord Russell can trust to the accuracy of those distant convictions it is not for us to say. It certainly does read strangely in the history of modern statesmanship to find that remedies assented to, and even proposed by, leading Ministers should by them have been believed to have been useless palliatives, disturbing the course of English administration, and leaving the just grievances of Ireland very much as they were.

But now that the work is done by other, and then opposing, hands, Lord Russell joins in the common disappointment that the turbulent ecclesiastical spirit of Ireland is as unappeased as ever; and that the Protestants, who looked on the Establishment as the main link of their connexion with England, are alienated, without any prospect of Catholic loyalty and content. He draws, indeed, attention to a fact hitherto singularly overlooked, that although the Hierarchy of the future is abolished, and ultimate religious equality secured, yet at the present time the Protestant Church retains all the appearance, and much of the reality, of dignity and wealth, and that it must take a considerable time for priests and people to realise the change in the position. And even when this has come to pass, Lord Russell very reasonably doubts whether the political evils incident on the entire dependence of the Catholic clergy on a poor and excitable population will not still continue to influence and embitter the popular mind; and he is driven to look back to the solution, so often proposed and so long rejected, of the endowment of the Catholic priesthood by the State. Now, he says, the funds are there, avowedly superfluous for the objects to which they have been applied. You speak of giving them to hospitals, to lunatic asylums, or other indifferent institutions: why not use them for the only purpose which can ensure religious satisfaction and national content?

Has Lord Russell, when he makes this suggestion, seriously considered why this has not been done long ago? It has never wanted proposers or advocates among the wisest of Englishmen. It was practicable at the time when Catholic Emancipation was granted, but it was too much for the Duke of Wellington, who said that the one great action was enough for him to undertake, and he could not afford to make it more difficult. It was possible for Sir Robert Peel, at the time that he confronted the angry Protestantism of the country on the question of Maynooth College, and could hardly have excited more violent and unreasoning opposition for a great than for a comparatively

small object of conciliation. It was, lastly, not only possible and practicable, but easy for Mr. Gladstone when in the progress of the Bill for disestablishing the Irish Church, the House of Lords in committee adopted the principle in the most effective and simplest form of securing glebes and houses to the Catholic priesthood. When such opportunities as these have been lost, what hope can Lord Russell himself entertain of the success of any proposal in this direction, by any Minister however powerful. It is no exaggeration to say that the English people in their present temper and thought would prefer a civil war.

The "Suggestions" on the subject of National Education would hardly be intelligible without the knowledge of the deep sense of the indefeasible rights of the religious conscience which has ever been to Lord Russell not only a political conviction, but an hereditary principle of action. In this view it is not surprising that he should sympathise with the scruples of the extreme Nonconformists, and he carries this feeling to the extent of being prepared to sacrifice the whole of Mr. Forster's scheme, rather than maintain the obnoxious provision. He entirely assimilates the grievance to that of the exaction of Church-rates from conscientious Dissenters, and places the demand for its relief on a level with the reclamation which was satisfied by the Act of 1868. On the other hand, he fully approves of Mr. Forster's principle to "supplement the existing education, and not build a new house from the beginning." "Indeed," he adds, "if such had been the attempt, the Government would have been guilty, not only of a large superfluity of grants and much waste, but of great ingratitude." He therefore regards the discharge of this disputed payment, either by a Parliamentary grant, or out of the existing funds of Church schools, as indispensable if the present scheme is to be continued. But the rough sketch which he gives of a plan of National Education really supersedes the whole system of school-rates altogether, and reverts to the Parliamentary grants which were the resource of former times. He would establish some six hundred free schools where the Bible should be daily read, to be maintained by payments from the Consolidated Fund, and he would subsidise sectarian schools, including the Roman Catholic, to the extent of half the yearly cost for ten years to schools built and founded before the year 1870, and of one-fourth of the yearly cost for five years to schools built and founded since that date—the whole to be under the direction of the Committee of Privy Council. The Revised Code should not be permitted or revived, and the teaching of geography and history, and the elementary parts of political economy, should be obligatory in the upper schools, and, in small districts, in the upper parts of the elementary schools. In such an arrangement as this, it is difficult to see where there is any place for any system of rating, which is the great innovation on our former practice, and which is believed to offer such substantial advantages. The main objections to Parliamentary grants for education were the continual discussions to which they gave rise, the uncertainties con-

tingent on the condition of the public revenue, the difficulties of the general application of any forms of education to the circumstances of different localities, and the want of that identification between local taxation and local interests which enables this country to bear cheerfully so large a weight of public expenditure for particular purposes. A National Education is now inaugurated and is spreading itself throughout the kingdom with a rapidity and facility which its warmest advocates could hardly have anticipated, and except for the partial clamour, which Lord Russell justifies, is gradually dissociating itself from our political and religious differences. Unless some unforeseen change occurs in public opinion there is far more probability that before long the slight anomaly which is contained in the Nonconformist objection will somehow be remedied, than that so great a work, the fruit of so much earnest zeal for the good of mankind, and so much disinterested endeavour, should be superseded or destroyed. Indeed the mind of the reader of this chapter cannot fail to be impressed by the conviction that here Lord Russell is speaking *ab extra*, without that real knowledge of the truth of the position of affairs which belongs to those who have mixed in the conflict of opinion and partaken of its hopes and fears. If he had done so, as no doubt he would have done had the discussion fallen within the range of his own political activity, there is little doubt that Mr. Forster would have found in him a resolute supporter, and might, perhaps, have derived from his mature judgment some counsel which might have anticipated and removed a difficulty that has now grown into such undue proportions.

Towards the conclusion of the volume Lord Russell reverts to the subject of Parliamentary Reform, and referring to the probability of a still further extension of the suffrage, invites the statesmen of the future to consider a project which certainly has been somewhat forgotten, namely:—

"The Government of the Commonwealth of England, Scotland and Ireland, and the dominions thereto belonging, as it was publicly declared at Westminster, December 16, 1853, at which time and place his Highness Oliver, Lord Protector of the Commonwealth, took a solemn oath for observing the same."

As this great document can hardly be well known to many of Lord Russell's readers, unless they have the good fortune to possess the facsimile printed for private circulation by the late Mr. MacCulloch in 1867, it would have been well if he had inserted it in his Appendix, and enabled them to judge of the value of his recommendation. With a good word for the Republic which, if it had continued, "John Milton and Algernon Sidney would have contributed to support, the one with his extensive learning, the other with his high spirit, and both by their lofty and unblemished characters," he utters a fervent and humble prayer for the maintenance of that hereditary monarchy, under which we enjoy "as large a scheme of popular freedom as any of the ancient Republics ever devised." It may, therefore, be assumed that it is to the portion alone of the Act that affects the popular representa-

tion that he desires to refer. If this plan should find favour with future reformers, we should have triennial parliaments, four hundred members for England and Wales, not more than thirty for Scotland, or for Ireland. Other peculiarities of the scheme are the large preponderance of County representation, the fewness of the towns returning two members—only twenty-two in the whole—no town in Wales returning members except Cardiff and Haverfordwest—and the appearance of the names of Leeds and Manchester, then in the commencement of their growth and importance, but not destined to acquire their fair rights till after the lapse of a hundred and seventy-nine years. We shall not, at any rate, revert to the exclusion of all "who do or shall profess the Roman Catholic religion," and there might be some difficulty in applying the test "that the persons who shall be elected to serve in Parliament shall be such (and no other than such) as are persons of known integrity, fearing God, and of good conversation." The County Franchise was given to "all and every person and persons seized or possessed to his own use of any estate real or personal to the value of two hundred pounds"—a tolerably high qualification when the difference in the value of money is considered, and not very susceptible of application to our times and circumstances.

Lord Russell's allusion to this interesting but somewhat obsolete effort at Reform of Parliament, therefore, may be attributed not to any very precise notion of the applicability of this incident in our constitutional history to modern times, but to that peculiar inclination, mainly personal, but not without relation to his Whig breeding and associations, to regard our political life as an historic whole, dependent upon great continuous principles, and little moved by special circumstances or individual men. It is thus that the politicians of our day have heard his frequent allusion to Magna Charta and the Bill of Rights with something of irreverent amusement, and have hardly done justice to that admirable harmony of thought and feeling which has given so much completeness and integrity to his life. It is with this impression that every Englishman will close this volume, and welcome it, not only as a valuable accession to our public annals, but as a testimony of the lofty aims and honest purpose that are compatible with strong party feelings and aristocratic impressions in such a nature as Lord Russell's, and under the happy conditions of the society in which his lot has been cast.

HOUGHTON.

The Life and Letters of Rowland Williams, D.D.; with Extracts from his Note Book. Edited by his Wife. In Two Volumes. (London: Henry S. King & Co., 1874.)

DR. ROWLAND WILLIAMS, in spite of some failings, was a remarkable man, and since his name must figure in every history of the Anglican Church, and his book on Hinduism and Christianity may possibly, in time, obtain some influence, which, however, is rarely achieved by prize works, it is the duty of those contemporaries who knew him best to take care that he occupies his proper place

in the English, or rather in the Welsh Wal-halla.

Attention, therefore, is requested to the following anecdotes, neither of which will be found in the two handsome volumes before us.

Just a quarter of a century ago, a tall thoroughbred stallion, rather wayworn, but still disposed to be vicious, bore a jack-booted rider to the door of a Vicarage in a Midland county. In front of his house the master himself happened to be standing, and to him the horseman, with a smile on his lips and a frown on his brow, thus spoke: "I have ridden across the country from Cambridge, can you put me up till Monday?" "Certainly, if you, who always carry sermons in your head, will preach for me to-morrow." "Excuse me," was the reply, "I prefer to listen to you."

Accordingly two sermons were preached, and the volunteered verdict was as follows: "Humph, I heard you imperfectly in the morning, but what I did hear struck me as very commonplace. As for the afternoon, you sent me to sleep at once." The rider on the vicious stallion was Dr. Rowland Williams; the part of preacher and host was enacted by the writer of these lines.

Another story is even more characteristic. Near the first turnpike on the road from Cambridge to Madingley there is, or was in the year 1838, a deep but dry ditch. At this point, in the course of their constitutional, two scholars of King's arrived one day. The shorter of the friends had been talking during the walk, while the other remained silent. Not to make any mystery, the speaker was Rowland Williams; the other, as poor Spankie of Eton used to say, was a man of no note. The subject was the Apocalypse. Is the Pope Antichrist? This, according to Rowland Williams, was absurd, for—but the reasons need not be given. In this view his silent friend acquiesced, and there was nothing more to be said on that side of the question. So Rowland Williams took up the opposite side, and with much learning proved that the Pope was Antichrist; and Rome Babylon. The silent Umbra looked a little surprised, but again he acquiesced. Instead of being flattered by this double submission, the controversialist shoved his companion into the ditch and walked home alone. These stories, it is to be hoped will throw some light upon the incidents which caused the late Vicar of Chalke to become known to the world. Of course, we refer to the part which he took in the publication of *Essays and Reviews*, of which book he was at one time supposed to have been the instigator and editor. It seems now that this distinction belongs to Mr. Wilson; but Dr. Williams did beat up for recruits, having succeeded, as he tells us, in securing the brother of the Bishop of Carlisle; and having failed, as the present writer happens to know, in his application to Dr. Badham. It was partly owing to these rumours, but chiefly to the peculiarities of his style (which, by the bye, are kept out of sight in the Memoir), that the Review on Bunsen gave more offence than all the rest of the matter put together. One hardly dares to say that Rowland Williams intended to produce this effect, but he certainly regarded it with feelings more akin

to satisfaction than to regret; for he knew that there are two ways of getting a hearing—the one is to be striking, and the other is to be struck. But, granting this, it may be asked how could a man—who, with such rare ability, had pointed out the superiority of the Gospel morality over the purest specimens of Hindoo theology—pour such a teasing fire into the Christian flank? The truth is that, while the discipline of Long Chamber had been wholesome, Roland Williams in after life had not been so fortunate in his surroundings. At the Junior Comby, and in the Combination Room of King's, there had been few companions of any sort and still fewer equals, which state of things, acting upon a temperament essentially Welsh, spoiled him (as has been seen) for peaceful companionship with weak people, even when they were disposed to be subservient. Then his residence at lonely Lampeter, and afterwards among the rustic Ritualistic Rectors of South Wilts, who knew nothing of Goronva Camlan, or of the famous Muir essay, tried his patience beyond endurance. To be surrounded by men who regarded themselves as parochial Popes, and who spoke of their Bible as though it had come down from heaven, printed by Spottiswoode, and bound in calf, became so intolerable that he was resolved to land them in a ditch, although, when there, they might be on the top of himself. And he was the less unwilling to give the impatient shove, because he had always felt a firm conviction that the ideal Church, the true House of God, would look more solid, when the shoring up of stupid people, which he calls (v. ii. p. 93) "forged texts, spurious creeds, and misunderstandings of orthodox bunglers," had been swept away. But while the Doctor meant to revenge himself, like another Juvenal, on these prosperous twaddlers, who had made him listen while they would not listen to him, and determined to do this at all hazards, he was by no means unaware of the great hazards which he had to run. Convinced then that he would madden both High Church and Low Church, and knowing that he had no party of his own, not even the Stanleyites, to back him, he deemed it prudent to advance by sap and mine and zigzag; in other words, with a free use of the innuendo, and the "as it were," and above all, with Bunsen before him, to play the part of a cowlifter, and thus to obviate the upsetting of the train. It was through these loop-holes and back doors, made familiar to him by a long indulgence in paradoxes, that the Vicar of Chalke escaped when brought to book by the Supreme Court of Appeal. But it was this policy of evasion which caused the seven Peers present at the hearing to withhold from Dr. Williams that admiration which had been roused by the saddened frankness of Mr. Wilson, who, like Dr. Williams, pleaded his own cause. It is true that the Lords appreciated the abundant learning, the astute ingenuity, and the indomitable pertinacity which the great Welshman exhibited; and possibly they reflected that he, who was then pleading before them for leave to retain a petty Vicarage, might have sat among them as a Bishop, if only he had been content to offer a little incense to those

exacting Potentates of Ecclesiastical England, "Parama" (vol. i. p. 304) "Humbdrum," and "Iswara" "Humbug" (vol. i. p. 304). They were, however, disposed on the whole to think that Dr. Williams ought to have been a Doctor without the prefix of Reverend; in other words, that he should have adopted the profession of a Proctor. And this work would have been congenial, if only there had been enough of it, which seems probable now. A Simeonite to be defended one day, a Mackonochie the next, and after that a Colenso. What could have been more agreeable to his versatile and eminently eclectic spirit? And then to think of attacking each of them in turn, by way of a change. How few of us know what our work in life should be; how rarely do we set ourselves the tasks which would suit us!

An abstract of the verdict which reversed that of the Arches, will be found at p. 149 vol. ii., and it is well worth reading. Dr. Williams, it seems, was not pleased with the word "unseemly," applied by Lord Westbury in reference to part of the Review; but he would have been still less pleased by an extra-judicial sentence which one of his judges is said to have passed upon him. It was as follows, and is attributed to Lord Kingsdown—"Do you want to know my opinion of Dr. Williams? Well: he has enormous brains, but he is a singularly little man."

Dr. Williams, however, was by no means a little man, except in stature. Indeed, intellectually speaking, he looks like a giant in comparison with the Dignitaries whom he demoralised in letters which are models of clearness and vigour. By the side of the great Bishop of St. David's the case is altered. It is clear, however, that the Bishop had a considerable respect for the Vice-Principal of Lampeter; and one of the most curious passages in the Memoirs is the description of a visit made by Dr. Williams to Abergwili Palace, on which occasion the two sat opposite, and eyed each other from time to time over the books which they pretended to be reading. The tour on foot is also admirably described. In the course of these walks he gave a refractory Piedmontese a sight of his pistol, and, denying that he was an Englishman, which was always a point of honour with Goronva Camlan, he was supposed by the Italians to be a German, and consequently incarcerated. He appears, however, to have lost nothing on the occasion except a tooth, which the Doctor of the prison of Isella extracted for him. Some people might think that if Rowland Williams had had more of his teeth drawn in the course of his life he would have been a better man. And this may be true. But a good man he undoubtedly was, and a tender-hearted man also. It is impossible for any one not to feel this as he reads the diary, the letters, or still more the prayers which were composed by him in great numbers throughout his life. Very touching, too, is the lament over his father, who had prospered greatly in the Church of Wales.

The keening over Llew, or Lion, a huge ferocious dog which he inherited from his father, is also very characteristic. But to appreciate its merits the whole story must

be told, of which we can only give part. Coming, as the big mongrel did, from the dear old home, the Rectory of Ysceviog, the brute was to be cherished at Lampeter, was to share the Vice-Principal's room and board, being his one ewe-lamb, at least until that peerless wife, whom he had met by chance at Heidelberg, should take the favourite's place. So man disposed, but the result was otherwise. On the first day Llew did not wait to be helped to his dinner, but he helped himself, taking for his share the whole leg of mutton. Now Rowland Williams was not the man to be treated in this way either by a Bishop of Salisbury or by a cur, however big. So he did battle at once, and thus scored another escape from death, in addition to many, the series of which had begun even in infancy, when a Welsh Sangrado bled him habitually to cure debility! However, if the dog did not kill his master, neither did his master kill him, poor Llew being reserved for a worse fate.

There is one fault to be found with the book over and above the misprints, which are frequent and annoying. This is the substitution of the dash (—) for proper names. Of course this must be done sometimes, but it need not be done as a rule, and apparently for no better reason than an inability on the part of the authoress or printer to make them out. But good as the book is, on the whole, the photograph of Dr. Williams, which it contains, is the best part. A truer likeness never was produced.

R. W. ESSINGTON.

Voltaire et la Société Française au XVIII. Siècle. Voltaire et J. J. Rousseau. Par Gustave Desnoiresterres. (Paris: Didier, 1874.)

M. DESNOIRESTERRES publishes this year the sixth volume of his long-sustained and exhaustive history of Voltaire. Again he reaches throughout that uniform degree of unusual and useful merit which the skilful execution of the earlier numbers of his series has prepared us always to expect from him. We have before called attention in these pages (Aug. 15, 1872) to the eminent degree in which M. Desnoiresterres possesses all those qualities which go to the making of an excellent biographer. He writes with ease and good breeding; he selects with superior intelligence from the vast mass of materials which lie at his disposal; he handles his matter with just judgment and discretion; and although he zealously explores every source of information, he keeps in place and order the varied crowd of details with able generalship, so that the reader, always interested, is never wearied or oppressed. There is yet another point especially worthy of notice, and that is the attitude of what may be called friendly impartiality which M. Desnoiresterres maintains towards his subject. He is perfectly honest, yet never unkind. He does not shrink from telling us clearly the ignoble facts of the famous quarrel with the President des Brosses (chap. iii.) about fourteen loads of wood which Voltaire had most certainly burnt, and for which he obstinately refused to pay, but at the same time he lets us see how this apparently niggardly ob-

stinacy had its source in springs which nourished some of the larger and more splendid virtues which distinguished his hero. We are made to feel that a connexion exists between the wrong-headed, fiery persistency which he sometimes showed in resenting a fancied wrong done to himself, and the noble tenacity of purpose and singleness of conviction which he displayed in his unselfish endeavours to right the wrongs of others. In the same spirit of fair dealing M. Desnoiresterres treats of Voltaire's attitude and action in religious matters. He never permits the special shade of his own sentiment on these subjects to betray him into an illiberal estimate. Though he clearly indicates his own distaste for the flippant blasphemies by which Voltaire and his *frères* constantly outraged the bounds of good judgment and good feeling, he does not emphasize it unnecessarily, but accounts these offences rather (as in truth they were) weapons hateful in themselves, the use of which was well nigh justified by the desperate nature of the situation in which they found themselves.

The volume before us opens with the advent of Mdlle. Corneille at Ferney, an episode in Voltaire's life which should ever be held in honourable memory. In this adoption of an unknown girl, whose only claim to his notice was her descent from a brother of the great Corneille, Voltaire gave evidence of the most uncalculating generosity. The varied obligations entailed by the due support of the burden which he had thus taken upon himself he fulfilled with unselfish and faithful zeal. For the course of her education, and finally for her suitable establishment, the most discreet provisions were made; nothing was omitted, nothing was forgotten which the care of a wise and affectionate father could have supplied. To the arrival of Mdlle. Corneille succeeds the affair of the curé of Moens, and here again we have (as M. Desnoiresterres happily says) the Voltaire "des bons jours." The curé of Moens was an excellent priest, who, disturbed by the news of the presence of three younger men in the house of a favourite female parishioner, and desirous of preventing the possibility of scandal, armed a troop of honest peasants with bludgeons, and, thus accompanied, set upon the three youths and successfully accomplished the feat of beating them within an inch of their lives. In order to make sure that the party were quite incapable of further mischief, the affair was concluded by trampling on their stomachs, after which they were left with the parting injunction, "to die like Huguenots"—i. e., without the sacraments. The relations of the youths were too frightened to resent the injury. Voltaire constituted himself their champion, and declared his intention of procuring for M. le Curé an "emploi dans les galères." But the clergy came to the rescue with the Bishop of Annecy at their head (the bishop, indeed, was of opinion that the curé had been guilty only of a somewhat ill-considered zeal), and so obstinate a defence was made that Voltaire was reluctantly obliged to relinquish his hope of rewarding the curé according to his deserts, and to rest contented with an award of "quinze cent livres, sans détrimen, bien

entendu, de tous les frais." In the second chapter Rousseau comes upon the scene. Julie, after having turned the heads of all Paris, arrives at Ferney. Voltaire, already recklessly insulted by Rousseau, attacked his famous romance in four letters, the first of which bore the name of the Marquis de Ximenes; but this deceived no one as to the true author, and the breach which was soon to end in total rupture now grew wider and wider.

Mr. Morley, in his chapter on Voltaire at Ferney (p. 327), has shown a force of true insight in stating the causes which made the quarrel between these two men inevitable. He seizes the essential nature of the antagonism which slowly developed itself, and which had its origin, not in accidents of popular rivalry, but in the very quality of their respective genius and character. It is a remarkable testimony to the justness of Mr. Morley's judgment that M. Desnoiresterres (who works on quite another line and method) furnishes us as he groups his facts with precisely the illustrations suitable to the different stages of Mr. Morley's argument. Rousseau, as Mr. Morley tells us, thought, or rather felt, with passionate sentiment about the wrongs and misery of suffering men and women, while Voltaire's single object was to reinstate the understanding in its full rights, to emancipate thought. He never contemplated a social revolution, and M. Desnoiresterres (p. 238) remarks, in commenting a letter written by him to D'Alembert in 1757:—

"Voltaire, qui n'aspire qu'à l'affranchissement du genre humain, mais qui ne suppose point que l'on puisse se passer de laquais, exclut, comme on le voit, la canaille de sa république. La vérité n'est pas faite pour les classes inférieures qui peuvent aller à la messe et au prêche, même au grand avantage de leurs maîtres."

Voltaire, indeed, was, on the whole, eminently successful; as M. Thiers has said, "on pardonne volontiers à un ordre de choses dans laquelle on a trouvé place." This success in itself was an eyesore to Rousseau. As long as he himself was obscure, as long as he was unambitious of literary distinction, he could give himself up without afterthought to the sentiments of pleasure and admiration with which certain works of Voltaire inspired him. When, however, he too became famous, the irritable vanity which coated the natural moroseness of his temperament was aroused, and Voltaire was hated as a rival (Desnoiresterres, p. 83)—a rival who was enjoying in his native town the place which of right was his, and from which he was virtually excluded. In 1756 Voltaire's poem on "Le Désastre de Lisbonne" appeared, and a Genevan pastor applied to Rousseau as the champion best fitted to refute the theory which it contained, and which was of so flagrantly impious a nature. Rousseau thus called into the arena warmed to the fight, and closed the letter which he addressed to Voltaire on this occasion with an open declaration of his hate. After this the obligations of friendship no longer existed, and when the *Nouvelle Héloïse* appeared Voltaire spoke his mind frankly, but he does not seem to have gone beyond the limits of his real convictions. "The very language of

Rousseau," says Mr. Morley, "was to Voltaire as an unknown tongue, for it was the language of reason clothing the births of passionate sensation." Rousseau's powerful dialectic can perhaps scarcely be called the language of reason, though sometimes, as in the *Lettres écrites de la Montagne* it almost wears its semblance. To the positive, reasonable turn of Voltaire's genius, the morbid sentiment and unhealthy exaggerations of Rousseau were additional causes of offence. Yet, despite his antipathy, no sooner did the persecution of Rousseau commence, than Voltaire opened his doors to one whom he had never ceased to regret as an able soldier deserted from the good cause. This has been by Rousseau himself strenuously denied, but the documents brought forward by M. Desnoiresterres, and the arguments with which he accompanies them, place the fact beyond doubt, and it is clear that Voltaire was equally zealous and sincere in making the offer.

The terrible dramas of Calas, Sirven, and De la Barre close the present volume. Space forbids us to enter into the melancholy details which are in each case recounted by M. Desnoiresterres with a scrupulous fidelity to facts, a fidelity which admits of no concealments or omissions. Such circumstances as might tell against the innocence of the victims are set before us with unshrinking precision. The materials on which the statement of the case of Calas is founded are gathered in the main from M. Athanase Coquerel's judicious history of the proceedings, a work to which M. Desnoiresterres pays a just tribute of praise, warmly acknowledging the services which the author has rendered. The task of collecting and sifting the evidence has been thoroughly performed, and throughout the enquiry has been conducted in a judicial tone and moderate temper, even when the reader might have expected and excused a violent outburst of indignation. That Calas was a victim as absolutely innocent as Sirven no one now should doubt. Yet quite recently there have been those who have undertaken the hopeless task of rehabilitating the tribunal which sacrificed him to the mad fury of popular prejudice. The work of M. Coquerel is, however, the only one which takes into account the totality of the evidence, all other authors having been content with documents derived exclusively from one source, and having neglected those to be found in the national archives. Thus M. Charles Barthélemy, though writing four years after M. Coquerel (of the very existence of whose book he appears to be ignorant), relies wholly on the reports of the trial at Toulouse, and passes over in silence the evidence furnished by the enquiry at Paris. The conduct of Voltaire in these affairs was nobly great. When all the world, terrified by the risk of incurring useless odium, rested in shuddering silence, Voltaire spoke. With self-sacrificing devotion he put aside the occupations which were dear to him. Night and day for seven years he never relaxed his efforts until he had aroused the popular conscience, and backed by a public opinion which he had himself created, wrested from a jealous and unwilling authority tardy sympathy and succour for the innocent, and the condemna-

tion of the unjust judge. Other episodes in these pages place "le bonhomme Voltaire" before us in the same light. Not once only does he come bringing deliverance to some member of the faithful company of martyrs sent to the galleys "pour avoir prié Dieu en mauvais Français;" and the irrefragable contemporary testimony which M. Desnoiresterres has wisely placed before us is sufficient to convince the most prejudiced of his perfect disinterestedness, of the perfect purity of his humane enthusiasm.

The volume closes with the year 1756. When the entire work is completed we shall have in our hands not only a complete collection of all the information concerning Voltaire which can possibly be desired by those who do not wish to be at the pains of investigating original sources; but we shall find in M. Desnoiresterres' biography the indispensable book of reference for those who may be engaged in independent study of the same subject. E. F. S. PATISON.

Historic and Monumental Rome. A Handbook for the Students of Classical and Christian Antiquity in the Italian Capital. By Charles Isidore Hemans. (London: Williams & Norgate, 1874.)

MR. HEMANS, who is so well known for his writings on mediæval and sacred art in Italy, published in 1865, at Florence, *The Story of Monuments in Rome and its Environs*. The aspects of the subject have so much changed, and its field has been so much enlarged of late years, owing to the progress of the excavations and the amount of recent researches devoted to Roman antiquities, that the author has entirely rewritten his former work, for the English public. His long residence at Rome, and his love for the subject, have given him peculiar advantages, and he largely shares in the fascination which the Eternal City seems to exercise on the North. Ampère admirably expresses the feeling in his *Histoire Romaine à Rome*, but it cannot be more strongly depicted than it was long ago by the Gaulish poet Rutilius, a poet of the fifth century, who adhered to paganism, and who expresses, when obliged to quit the charmed scene and return to the cold North, the sorrow of an exile blent with enthusiasm for the Imperial City, her temples, theatres, aqueducts, and all the sunlit splendours of her seven hills, which he was leaving for ever. No critical enquiries can deprive the ruins of Rome of their charm, though we no longer (with Petrarch) mistake a pyramid tomb like that of Cestius for that of Romulus, or the enormous arcades near the Forum for the Temple of Peace founded by Vespasian; and though modern writers have analysed to its depths that Christian mythology which is, in fact, the contemplation of theological subjects and saintly examples by the popular mind in a devout but little educated age. Rather it might seem that modern enquiry has given a larger interest to archaeology, and invested it with a more deeply-felt reverence; while the researches in the catacombs and other primitive Christian monuments have brought to light far more which confirms and accords with truths embraced by all Christians, than any elements

proper to the region of controversy, or capable of being used for refutation or attack.

In his first chapter, therefore, Mr. Hemans rightly gives us an account of the "literature illustrative of Rome;" and in the second, of "the sources of early Roman history." The scepticism as to Romulus and his successors is not of modern growth. Plutarch, who was long resident in Rome, and certainly not inclined to disbelief, distinctly asserts that Roman history had been corrupted, and its earliest documents destroyed. In his life of Numa, too, he says expressly, "a writer named Clodius" (perhaps Claudius Quadrigarius), "in a book of his entitled *Strictures on Chronology*, avers that the ancient registers of Rome were lost when the city was sacked by the Gauls; and that those which are now extant were counterfeited, to flatter and serve the humour of some men, who wished to have themselves derived from some ancient and noble lineage, though in reality with no claim to it." Tradition, as summed up by Livy, Dionysius, and Plutarch, is in favour of this view, and Mommsen has done much to prove it independently.

The following chapters Mr. Hemans devotes to a series of walks among the ruins, on the Northern Hills, the Palatine, the Forum, the Capitol; then turns his steps to the Colosseum and the Catacombs; afterwards considers the main classes of buildings separately—mausolea, arches, theatres, aqueducts, temples, churches; concluding all with some account of recent discoveries, especially as regards the walls of Rome. While pointing out the services of several of the great popes in preserving the ruins of antiquity, our author has to lament over much which others have done in the way of destruction. Honorius I. stripped the gilt bronze tiles off Hadrian's Temple of Venus and Rome for the adornment of St. Peter's Basilica. Sixtus IV. did even worse, for he took down some beautiful arches to convert the stone into cannon balls! Sixtus V. destroyed the splendid Septizonium of Severus, that its marbles and columns might adorn his own buildings. Paul III. ruined the *Thermae* of Antoninus. It was long before the general opinion of Europe made itself felt in the Vatican. But Mr. Hemans also describes at length the efforts and liberality of the later popes for the preservation of the classical monuments, and does every justice to their policy. We have read the book with great interest, and trust the author will be enabled to communicate to us the results of the excavations now so rapidly progressing, in a third edition of his entertaining and instructive work. The science of archaeology is founded on a deep interest in the history and the works of man, and in Rome every epoch is represented, from the Stone age to that in which we live.

C. W. BOASE.

Shakespeare's Centurie of Prayse. Being Materials for a History of Opinion on Shakespeare and his Works, culled from Writers of the First Century after his Rise. By C. M. Ingleby, D.C.L. (London: Trübner & Co., 1875.)

DR. INGLEBY'S very careful compilation is meant to include almost all the passages

alluding to Shakspeare which occur in books or writings between 1592 and 1693. Similar collections have been projected before, notably by the late Mr. Bolton Corney, but have never been completed. The series of Shakspeare Allusion-books which Dr. Ingleby is publishing for the New Shakspeare Society is nearly the same in design as the present work, the difference being that the series professes to give the whole or an integral portion of the books, while the *Centurie of Prayse* gives only the passages in which the allusions occur. Dr. Ingleby, in a modest preface, states the difficulty of his task, and the unlikelihood that the first attempt to attain completeness should be entirely successful. Indeed, when the whole literature of a hundred years has to be searched, it is hard to see when the collection can be pronounced complete: there may lurk so many allusions which want an Oedipus to unriddle; so many obscure passages may have been wrongly tacked on to Shakspeare; and so many rare books or manuscripts may still be extant which have not been read by any one sufficiently on the look-out for such passages. There is one whole class of allusions which Dr. Ingleby hardly knows whether to acknowledge or ignore—the imitations or quotations from Shakspeare which occur in such multitudes in succeeding dramatists. A few such passages are printed in their proper places; one or two more are found among the “supplementary extracts;” and a postscript adds a few more, as “a very small contribution” towards “tracing the influence of Shakspeare’s works on his successors of the seventeenth century.”

In the classes of extracts where Dr. Ingleby approaches nearest to completeness there are some notable omissions. For instance, although he quotes (p. 45) from the Third Report of the Historical Manuscripts Commission, p. 148, Cope’s letter to Lord Cranborne about Burbage and *Love’s Labour Lost*, yet he misses the very curious postscript from a letter of Lady Southampton to her husband, on the same page of the same Report, which seems to refer to Shakspeare under the name of Falstaff:—“All the nues I can send you that I think will make you mery is that I reade in a letter from London that Sir John Falstaf is by his Mrs. Dame Pintpot made father of a godly milers thum, a boye thats all heade and veri litel body; but this is a secret.” That Shakspeare was sometimes called by the name of his favourite character is evident from a letter, apparently of the first decade of the seventeenth century, in the *Collection of Letters made by Sir Tobie Matthews*, p. 100:—“I must tell you, I never dealt so freely with you in anie; and (as that excellent author Sir John Falstaff says) what for your business, news, device, foolery, and liberty, ‘I never dealt better since I was a man.’” It would be interesting to know what Lady Southampton meant when she made Mrs. Pintpot Falstaff’s Thalia; whether she likens him to Ben Jonson, inspired by pottles of sack and canary; or whether Pintpot is only the surname of Quickly, and hints at the “post-haste” rate of the poet’s pen. The description of the product, “all head and very little body,” shows possibly that even Shakspeare might sometimes be con-

cerned in a “displeasing play,” or, at any rate, in one where the dramatic interest was outweighed by some extrinsic relation; and the conclusion, “this is a secret,” may show that he sometimes wrote for private theatricals, and perhaps explains how *Troilus and Cressida*, in 1609, had been “never stal’d with the stage, never clapper-claw’d with the palms of the vulgar,” though evidently written, in great part, long before.

A third document that should come into Dr. Ingleby’s next edition is a letter from Sir Charles Percy to Mr. Carlington (Carlton?), of Dec. 27 [1601] (Record Office, Domestic, Eliz., of that date). Sir Charles had accompanied the Earls of Essex and Southampton into Ireland, and was now returned to his manor of Dumbleton, in Gloucestershire:—“Mr. Carlington, I am here so pestered with country business, that I shall not be able as yet to come to London; if I stay here long in this fashion, I think at my return you will find me so dull that I shall be taken for Justice Silence or Justice Shallow. Wherefore I am to intreat you that you will take pity of me, and, as occurrences shall serve, to send me such news from time to time as shall happen; the knowledge of the which, though perhaps they will not exempt me from the opinion of a Justice Shallow at London, yet, I will assure you, they will make me pass for a very sufficient gentleman in Gloucestershire.” Can Sir Charles have been the object of any occult chaffing when Falstaff enquires “What said Master Dombledon about the satin for my short cloak and my slops?” (2 *Henry IV.* i. 2. 32.)

These omissions are involuntary on the part of Dr. Ingleby. There are others purposely made, because he judges the allusions to be irrelevant (see the “list of exclusions,” p. 358). Perhaps it is a pity not to leave readers to form their own conclusions upon Nash’s Epistle, prefixed to Greene’s *Menaphon*, or his *Anatomy of Absurdity*, or Spenser’s *Tears of the Muses*, especially when we have Harvey’s letter of September 1592, noted as doubtful by Dr. Ingleby, and proved by me to be irrelevant in the *ACADEMY* of October 17, 1874, and Ben Jonson’s forewords to *Sejanus*, where he notices the “second pen” which had a good share in its composition. This second pen has been shown by Dr. Brinsley Nicholson to be, not Shakspeare, but an obscure poet named Samuel Sheppard. Dr. Ingleby not only supposes Shakspeare’s to have been the second pen, but on this error builds a further hypothesis that Shakspeare helped Jonson in earlier works. “We apprehend that it would not be difficult to extract from some of Ben Jonson’s earlier plays the lines contributed by ‘so happy a genius’ as Shakspeare.” And he proceeds to quote a “transcendently majestic passage on poetry,” spoken by Lorenzo junior in the last scene of *Every Man in his Humour* (1601). This passage is in its construction, in its words, and its phraseology thoroughly characteristic of Jonson; in it he poses himself as the virtuous censor and critical poet, whom he names sometimes Crites, sometimes Macilente, sometimes Lorenzo, sometimes Horace, but who, as Dekker points out, is always Jonson.

Dr. Ingleby might have strengthened his proof of the relevancy of the extracts from Willobie’s *Avisa* (pp. 14–16), by comparing them with the poem (No. xix.) in the “*Pas-sionate Pilgrim*,” which begins, “When as thine eye hath chose the dame.” The subject and metre are the same; and the treatment is so similar that stanzas of the two poems might be interchanged without any manifest repugnancy.

The use of this collection of allusions and references is to enable us to trace the history of the appreciation of Shakspeare. Emerson in his *English Traits* paradoxically tells us:—

“The unique fact in literary history, the unsurprised reception of Shakspeare—the reception proved by his making his fortune, and the apathy proved by the absence of all contemporary panegyric—seems to demonstrate an elevation in the mind of the people. Judge of the splendour of a nation by the insignificance of great individuals in it.”

This might be good argument if all the other great poets equally lacked contemporary panegyric. The age was well aware that poets were living amid it, and it proceeded to adjudge the sceptre and crown to those it thought worthiest. It enthroned Spenser, or Marlowe, or Ben Jonson, or Daniel, or Drayton in the seat of honour. These greater poets, who bandy about each other’s names, or address one another pastorally, never mention Shakspeare, or address him. We do not find him named during his life by the great lights of literature, but only by its obscurer votaries. His name does not occur (except after his death) in the writings of Jonson, or Donne, or Drayton, or Daniel, or Chapman, or Marston, or Dekker, or Heywood, or Monday, or Beaumont, or Fletcher, or Massinger, or Webster, or any other of the greater writers of the day—only in some who are scarcely known but by their mention of him—Meres, or Barnefield, or the author of the *Return from Parnassus*. Emerson, as Dr. Ingleby’s book proves, was much more right in a previous criticism:—

“Our poet’s mask was impenetrable. You cannot see the mountain near. It took a century to make it suspected; and not until two centuries had passed after his death did any criticism which we think adequate begin to appear.”

To know the earlier criticism Dr. Ingleby’s book is indispensable. R. SIMPSON.

SIMPSON’S LEWIS THE PIOUS.

Jahrbücher der Deutschen Geschichte. Jahrbücher des fränkischen Reichs unter Ludwig dem Frommen. Von Bernhard Simson. Band I. (814–830). Herausgegeben durch die Historische Commission bei der Königlich Bayrischen Academie der Wissenschaften. (Leipzig, 1874.)

THIS magnificent collection of the *Annals of German History* originated with Leopold Ranke. It is now some forty years ago that the father of critical history in Germany was surrounded by a band of thoughtful and energetic young men, among whom were G. Waitz, W. Giesebrecht, S. Hirsch, and R. Köpke. He watched their progress with interest, and, after testing their powers by means of the exercises upon which he set them to work, he conceived

the idea of employing his best pupils in a common work upon the national history of their country. A theme was chosen in the grand epoch of the Saxon Emperors, in which the various races of Germany were more united than at any other time, and in which the Empire was most closely connected with Italy. As so many writers were to be employed, it was impossible to look forward to a regular historical narrative from 918 to 1024, and it was thought better that their attention should be turned to a critical investigation into the original authorities, in order that light might be thrown on the dark places of the history. The original materials would then be reproduced in the form of a chronicle, without any attempt to work them up into a connected whole, or to compose an historical narrative in the modern fashion. Each reign was then assigned to a separate editor, except that on account of its extreme length, that of Otto the Great was divided between two. The work of each was to be submitted to the inspection and criticism of all the rest, and as all were able to count upon the final judgment of the institutor of the enterprise, they entered upon their task in the full confidence of producing a monumental work which would last for ever. In this way the reign of Henry I. was treated by Waitz; of Otto I. by Köpke and Dönniges; of Otto II. by Giesebrecht; of Otto III. by Wilmanns.

In 1858, by the munificence of Maximilian II. of Bavaria, the Historical Commission of the Bavarian Academy of Sciences was founded and richly endowed for a long series of years. Leopold Ranke, who had been named President of the Commission, led its first deliberations into the track of his earlier designs. As the Commission had larger sums of money than Ranke had been able to dispose of at Berlin, and as historical knowledge had been vastly extended in the interval, he was able to improve upon his first plan. It was determined that the *Annals of German History* should begin with the commencement of the Carolingian Empire, and should reach to the end of the fourteenth century, though the hope was not abandoned of continuing the series to later times. The works already completed on the Saxon Emperors were to be submitted to a thorough revision.

The work thus commenced has been actively prosecuted, and a considerable portion has been completed. Bonnell has treated of the origin of the Carolingian Dynasty; Oelsner of the life of Pippin after his accession to the royal dignity; Abel, unfortunately snatched away from his labours by an early death, of the early years of Charles the Great. The later Carolingians from Lewis the German to Conrad have been dealt with by Professor Dümmler of Halle, in his *History of the East Franks*, a work to which the Prussian Government has awarded the prize of 1,000 thalers and a gold medal, which is distributed every fifth year for the best work on German history. Next comes *Henry I.*, by Waitz, whilst the reigns of the three Ottos have as yet not been treated of. Two volumes of Hirsch's *Henry II.* have, however, appeared, and the third, by the writer of this article, is in the press. Nothing has as yet been published

on the times of the Franconian Emperors, but the first volume of Steindorff's *Annals of Henry III.* will appear during the present year. Of the period of the Hohenstaufen we have Töche's *Henry VI.* and the first volume of *Philip of Swabia and Otto IV. of Brunswick* by Winkelmann.

As time has gone on, deviations from the original design may occasionally be remarked, some of the writers, especially Dümmler and Winkelmann, having allowed themselves to keep less strictly to the annalistic treatment proposed. Yet, though a difference will thus be noticed between some of the volumes, the series has, on the whole, well preserved its common character. Every work is conducted in the spirit of a thorough critical investigation, and is entirely on a level with the latest results of historical enquiry.

Bernhard Simson's book, of which we have especially to speak, treats of the reign of Lewis the Pious up to the moment when the Emperor, having been deprived of all authority and influence by the rebellion of his sons, succeeded, at the Diet of Nymwegen, in October, 830, in bringing about a thorough mutation of the political constellations, and in getting back into his hands the fulness of imperial power. The general character of his government is well known. It led the way to the breaking up of the Frankish Empire which Pippin and Charles had founded. The renowned clemency and liberality of the Emperor dwindled down into the most miserable prodigality. One by one the Crown estates were given or thrown away; and whilst the central power was weakened, that of the vassals was continually on the increase. The good-nature and kindness of Lewis, counterbalanced by no energy, ended in the merest weakness, through which he forfeited the respect of his subjects, and even that of his own children, and which made him the plaything of audacious and ambitious favourites. But above all, the main cause of his misfortunes is indicated in his name, which tells of a piety which had degenerated into a dull and lifeless bigotry. What an impression must it have made upon the popular mind, when the successor of the Great Charles was seen cowering before the threats of ecclesiastical penalties hung over his head by his monkish advisers, submitting at Attigny to the most degrading penances, and allowing the bishops to decide upon matters of a purely political character, and to inflict punishment upon him. During the next eight years his reign was a perfect model of a clerical government conducted after the mind of the hierarchy. In 823 the Pope treated the weak Emperor with scorn by executing two Roman judges who were considered as attached to the Frankish government. Lewis, it is true, ordered an enquiry to be opened, but when he found that the Pope maintained his ground firmly, he withdrew from all further investigation into the matter. Thus gradually a change came over the relations between Rome and the Empire. In the place of the submission of the Holy See to the authority of the crown, after the system established by Charles, there arose a new relation between State and Church, as between two equal powers, until

the latter acquired a preponderating weight over the former.

In the second volume we shall be called to witness the unhappy results of the Emperor's weakness. In his last years all forms of misfortune gather darkly round him, whilst the Empire is torn in pieces by civil war. But even the present volume shows that the Emperor himself was at fault in all the evil that came upon him. Gibbon once took Charles the Great to task for founding an empire which could not last, and which quickly fell to pieces in the hands of his son. There can be no doubt that the charge is unjust. A ruler with a character such as that of Lewis could not have defended the best institutions from destruction. The only fault which Charles committed lay in his entrusting to such a son the reins of government, which must of necessity slip from his hands after no long delay. The view which we have here taken is no new one; but it receives a new confirmation from Dr. Simson's book. HARRY BRESSLAU.

Harry Blount: Passages in a Boy's Life on Land and Sea. By P. G. Hamerton. (London: Seeley, Jackson & Co., 1875.)

A boy's book which contains true pictures of life, which neither varnishes nor depreciates it unduly, which deals with boys' pleasures and boys' interests as if they were worthy of respect and consideration, and yet does not give them a fictitious value, is always welcome and somewhat rare. The sensations of boys are keen, their judgments are rapidly formed and often correct, and every boy knows when an author is "writing down" to him, and resents it. He wants friendship, not patronage; to be informed, not sermonised; his interests are real to him, sometimes more real than those of grown-up persons, and he requires that those interests shall be dealt with in a just and equal spirit. It has been so difficult for those who are competent to write, to associate themselves with the interests of boy-readers, in every-day life, that the result has been an immense number of books of adventures, books representing, sometimes truly, more often untruly, phases of boy-life, which are beyond the range of boys' experience and consequently of their criticism. The love of adventure and of the marvellous is inherent in most boys, and as the author has found it easier to write about desert islands, lion hunts, whaling adventures, &c., which he has never seen, and the boy likes to read about things which he is never likely to see, both are contented. But it is far healthier for boys to read some books about their own ordinary interests. Every boy may not find his way to the interior of Africa, but every boy likes to know how to handle a gun. It is given to few to find the North-west passage, but to understand the different parts of a yacht is not an uncommon or useless attainment. It is with these every-day interests that Mr. Hamerton deals in *Harry Blount*, and in many respects it reaches the standard of a first-rate book for boys. The hero is a healthy English lad, with a very moderate capacity for work and a very large capacity

for amusement. His parents were drowned at sea, and he is left to the care of a sensible grandmother. We cannot help wishing that she had sent him to a larger school than Brambleby, and being so sensible in every other way, it surprises us that she did not. But it hardly mattered whether Harry went to school at all or not, so little does education, as derived from books, seem to be necessary to his future. He goes to the Brambleby Grammar School, which is said to be like a tadpole, because its whole catalogue of masters consisted of a Head and a Tail master. He is bullied in a brutal and systematic manner which would hardly be possible except at a small school, and he is befriended by a preternaturally excellent young man called Calverley. He goes through various phases of a schoolboy's career—bumptiousness, failure, success, and popularity—but all school interests are subservient to the absorbing pleasures of riding, hunting, shooting and yachting, each of which is treated in turn, the largest portion of the book being devoted to yachting. Squire Healaugh, who is Harry's good genius about hunting and shooting, is an ideal old English gentleman. A man who will change horses in the midst of a good run, to give a boy the chance of being in at the death, is little short of a hero; and when we read that he adds to his generosity by giving two good rifles as prizes to two schoolboys for an afternoon's shooting, we feel that he must belong to some extinct race of fairy godfathers.

The excellent young man, Calverley, takes Harry out yachting, and the unselfish and sensible grandmother is the victim in this case, and suffers untold anxiety while Harry wins his experience of the sea. The yachting adventures are very spirited, and the chief interest of the book is centred in the trip of the *Alaria*, which becomes really exciting when Harry and his friend Greenfield are adrift on the Atlantic by themselves. A passage may be quoted here to show how forcibly the situation is described. The two brothers Calverley, who owned the yacht, started on some geological excursion, and left Harry and his schoolfellow on board, under the charge of two sailors, who immediately went on shore and had so much to drink that they were unable to return to the *Alaria*. "Suddenly there sprang up a breeze from the east, which increased to a gale of wind. The *Alaria* dragged her anchor out into the deep sea, and floated away into the Atlantic Ocean." The boys become aware of their danger and make good use of the knowledge they have acquired—but they drift on helplessly.

"The situation was now really critical, the waves had grown to an awful size, towering like opaque black mountains behind the little yacht, and threatening to engulf her. Not a star was visible in the densely-clouded heaven, but lights of another kind began to be visible, and these only added to the disquiet of our two young friends. They were the lanterns of ships at sea which were battling with the tempest in their own way, and able to contend against it with the knowledge of experienced captains and the strength of sufficient crews. Greenfield's heart sank within him as he perceived this new source of danger. 'We are approaching the track of the American ships,' he said, 'and we may possibly get run

down, as we have not a spark of light to show where we are.'

"Nor was this fear a groundless one. The lights grew more and more distinct, and at length the red and green lights of an approaching steamer were visible in vivid colour. It was scarcely possible to affect the movements of the *Alaria* with the rudder when she had no sail on her but a storm-jib. It seemed as if out of that wide trackless ocean the steamer was choosing exactly the very line which would place the little *Alaria* precisely in her path. The lights grew more and more brilliant and shone like two baleful stars. 'I wish those coloured lights were away,' said Greenfield, 'I don't like them!'—still they grew and increased, until at length the sound of the paddles could be heard above the waves, and the steamer bore down upon the *Alaria*.

"She was a huge Atlantic liner, before whose sharp, thin cutwater the strongest yacht in England would have gone down like a fishing-boat. A hundred passengers were in her splendid saloon, comfortably warmed, brilliantly lighted, thinking only of themselves, and trying to pass the time in amusement or conversation so far as the motion of the ship would let them, but never once imagining the possibility that she might send two fellow-creatures to the bottom unseen, unheard, and unlamented. The man on the look-out, however, with that keenness of sight in the gloom which sailors acquire by practice, had a vague fancy that he distinguished something, and passed a cry to the steersman, who, by a turn of the wheel, made the ponderous mass of the vessel deviate a little from its course, and that little saved the *Alaria*. The huge paddle passed close to her, churning the sea into foam, the bubbling water left a whitened track, and that danger was over."

The situation is a strong one, no unnecessary words are wasted upon it, and the simple rendering of facts is forcible and artistic.

It is a pity that the language of the different characters is not equally simple. Calverley is an intolerable prig, in spite of his goodness to Harry. What schoolboy, or even private pupil, was ever known to make such a speech as the following in reply to a boy's question, "What is the use of Latin and Greek?"

"They are of use when thoroughly learned, but not of much use when learned as boys generally learn them in grammar-schools, when they go away at fifteen or sixteen to be articled to attorneys, or put into business, with a very slight knowledge of Latin, and just Greek enough to read the Greek characters. It is so with all knowledge. For instance, it would be delightful to be able to play really well on the violin, but what is the good of playing badly? But the truth is that even at sixteen we might know Latin and Greek far better than we do if only we worked with a hearty good-will as we do at boating and cricket. Our teachers ought simply to have to guide us, whereas they have to push us too, and keep us in motion, for we have no motion of our own, and as soon as they give up pushing, we stop altogether. If we were all like Lady Jane Grey, who was passionately fond of her classical studies, and worked with a will of her own, we might be as good scholars as she was."

There is too much of this stilted talk scattered through the book, but as a whole it is written with considerable sympathy for boys, it is clever and interesting, and will certainly be popular. F. M. OWEN.

THE first volume of a translation of Milton's chief political works, by Dr. W. Bernhardt, has appeared at Berlin (Koschny). A favourable review appears in the *Revue Critique*, from the pen of Professor A. Stern.

CURRENT LITERATURE.

David Friedrich Strauss in his Life and Writings. By Eduard Zeller. Authorised Translation, with a Portrait. (Smith, Elder & Co.) Want of leisure and materials are alleged by the author of this "biographical sketch" as the causes which deterred him from attempting a complete biography or full delineation of the life and character of Strauss. We can hardly regret the forbearance, for a voluminous Life and Correspondence, such as will probably see the light eventually, ought to be edited, if possible, by a friend whose ideas of illustrative criticism go beyond the enumeration of mental and moral excellences in his subject. Herr Zeller has great faith in the power of adjectives. As it is, the memoir gives in accessible shape an account of the few incidents in Strauss's uneventful career. He was born in January, 1808, at Ludwigsburg, in what the translator (who succumbs more than once in the struggle with German idiom) calls "the comfortable limitation of burgher circumstances." In his fourteenth year he was placed in the evangelical seminary at Blaubeuren, which he has himself described in the life of his friend and fellow-student Märklin. In 1825 he entered the University of Tübingen, and plunged into the most mystic abysses of Romanticism. Of the professors' lectures he attended, those which had most influence upon him were naturally those of Baur. In 1831 he went to Berlin and affronted Schleiermacher on his first visit by exclaiming, when he heard of the sudden death of Hegel, "It was for his sake that I came here!" His *Life of Jesus Critically Considered* was published in two volumes in the summer or autumn of 1835. The storm of opposition excited by this work was such as to put an end to his prospects of a professorship at home, and the offer of one at Zurich, though made, had to be recalled out of regard to popular excitement. His next work, the *Glaubenslehre*, was published in 1840-41, after which, for more than twenty years, he published little but critical and biographical studies. In 1842 he was married to Agnese Schebert, whom he had first seen and admired on the stage, and from whom he was separated, after five years, by mutual agreement. Two years ago his final *Confession* attracted general attention to an extent which the *Life of Christ for the German People*, published in 1864, had on the whole failed to do. Herr Zeller does not contradict the general impression that the latter half of his hero's life was clouded by the easy and complete *succès de scandale* attained by his early work, which made any lesser notoriety seem like failure, while he had not such a taste for martyrdom as to enjoy the tribute of denunciation. The last chapter contains a few short poems written during the illness which proved fatal after many months of suffering; their merits, however, are of a nature to evaporate in translation.

A Grammar of Political Economy. By Major-General W. F. Marriott, C.S.I. (H. S. King & Co.) This grammar is written with a good deal of clearness and method; but the author is not content to use his intelligence in expounding the views of recognised authorities; and a "grammar" in which the views of Mill and Ricardo on rent and value are alluded to and set aside in a short note upon a chapter—in one case of two pages—can scarcely be recommended as sole text-book for learners. Major-General Marriott observes that "a thoughtful man may criticise justly what he could not originate;" but the criticisms which naturally occur to students of mediocre original power are generally partial and fragmentary, and even when they have an element of truth, undue proportion is given to the points on which issue is joined, because the minute pseudo-correction is all that the writer feels himself to possess a complete mastery of. As a specimen of the present writer's qualifications may be instanced his anxiety to find a definition of rent which shall include "the price paid for the

use of fixed capital," as well as for that of land, though he has no fresh views as to the possibility of framing propositions which shall be true of the two kinds of rentable instruments.

Memoir of John Grey, of Dilston. By his daughter, Josephine E. Butler. Revised Edition. (H.S. King & Co.) We are not surprised to find that a second edition of this interesting little memoir has been called for: it appeals on different grounds to three or four classes of readers, and the worst that can be said of it is, that some of these may think their own special topics would have repaid fuller treatment. On the one hand we have a family chronicle, interspersed with old letters and traditional reminiscences of the childhood of two or three generations, of partings and reunions, deaths and marriages, and all the simple domestic incidents, which have a certain charm even for strangers when they group themselves with almost typical completeness round a finely simple, central figure, and in this case possess the further attraction of innocent personal gossip for an unusually large circle of friends, relations, and connexions of many degrees of remoteness. Side by side with details of a merely private character, there are references to public events, going back to the early days of the great peace, when the party of reform was so weak, that a single Liberal politician of high character and local influence, like John Grey, was a personage of importance and on confidential terms with the leading statesmen of his side, though he was never prevailed on even to offer himself for election to a seat in Parliament. In 1833 he was appointed manager of the Greenwich Hospital Estates, an office which he held for thirty years, with equal profit to the estate, the tenants, and the cause of scientific agriculture, and with satisfaction to himself, as the influence which he possessed as virtual landlord of property the annual income of which had risen before his retirement to 40,000*l.*, enabled him to do much to improve the character of the farming operations of a large district. He was interested in the Royal Agricultural Society from its foundation, and had an enthusiastic belief in the results to be obtained by an alliance between the practical farmer and men of science. As a public speaker he had the success which belongs to ready wit reinforcing strong convictions: a fair example of his eloquence is in a speech at a banquet of the Royal Agricultural Society in 1846, replying to the regrets of a Protectionist nobleman:—

"We have been told by the noble Duke that there is a limit to improvement, a boundary beyond which we cannot pass. I am not at all nervous about it: *it will not be reached in our day; it will not be reached while unimproved properties and annual tenures exist.*"

Various references to the habits and condition of the agricultural labourers in Northumberland have a fresh interest at the present time, and on page 64 there is a letter from Mr. G. A. Grey, the eldest son of the subject of the memoir, on the different rates of wages and of working power in the North and South of England, written in 1868, and confirming with curious exactitude the conclusions in Mr. Brassey's later volume on *Work and Wages*. In 1863, John Grey retired from his office at Dilston, and five years later died peacefully among his own people, leaving a memory which Mrs. Butler has done her best to preserve to another generation.

Sheridan's Complete Works. With Memoir and Illustrations. (Chatto & Windus.) The illustrations are well chosen, and pleasantly though slightly executed. The memoir of Sheridan is a readable cento from Moore, with especial reference to the growth of the works which Sheridan did execute, while his plans for those which he did not are included in a separate section of the works: the editor might have pointed out that a good deal of the material collected for the comedy on Affectation was used up for the *Critic*, and in

fact Dangle is the same person as Bustle; he might have pointed out also that the *Devils or the Foresters*, another name for a less outrageous form of the same plan, is a curious anticipation of Schiller's *Robbers*, and shows that it was not a mere accident that Sheridan turned to Kotzebue when his own invention failed. It is also curious that he should have been so fond of the plan, for the specimens of its execution are unpromising enough; the only explanation that can be given is that he often felt so spitefully towards all the decencies of civilisation, that it seemed to him as if a work in which he should always be saying spiteful things must be interesting and valuable. This spirit of revolt (which appears in a mitigated form in the *School for Scandal*) probably had no deeper ground than the contradiction between his circumstances as a poor man in an artificial society, and his joyous, genial, self-indulgent temperament, which he thoroughly understood and made the most of. It is the fashion to cite him as an example of wasted talents, and it is very likely true that with care and self-denial he might have achieved a more successful, and certainly a more respectable life, but it is not equally clear that he would have produced better work. He had received or inherited a fine sparkling shallow nature, and it was his system to deny himself as little as possible, to keep in as high spirits as possible, and watch to see what his mind would produce spontaneously under these favourable circumstances, to take all possible care of the product, and to turn it over and over till it settled into the best possible form, and upon these terms he produced three really brilliant plays and a good deal of declamation, not too gaudy or overloaded for contemporary taste. Of course a man working in such a spirit cannot take hold enough upon life to be really independent and original; of course, too, his work will be more or less frivolous and heartless and unreal. The want of originality strikes us most in the plays, the want of reality strikes us most in the extracts from the too celebrated Begum speeches. We feel that Sheridan is trying all the time to make a romantic mysterious tragedy out of a shabby family quarrel, which after all had two sides to it. No doubt Burke was exaggerated, and in a way unreal too; but then he was misled by a serious sincere apprehension of the substantial misery of the natives of India; he saw that the faults of Hastings' administration had a tendency to aggravate standing evils, and he shut his eyes to what the nation saw well enough, the general benevolence and beneficence of that administration. Perhaps it was as well to print the translation from Aristænetus: though it has no literary value, it illustrates the softness, almost tenderness, of feeling which was part of Sheridan's charm.

EDITOR.

NOTES AND NEWS.

THE originator and most indefatigable advocate of a reform in spelling, Mr. Isaac Pitman, has enlarged his establishment at Bath in order to be able to meet the increasing demand for phonetic literature. His *Phonetic Journal* has reached a circulation larger than that of most weekly papers, and the demand for phonetic reading books is greater than ever. If phonetic reformers, instead of trying to determine and represent minute shades of sound, would agree on some broad principles, like those laid down by Mr. Pitman, there might still be a chance of carrying out some practical improvement in the spelling of English. But if twenty-four letters have sufficed for all practical purposes for the last 3,000 years, it is not likely that people will ever submit to employ a larger number in writing their own language.

ON January 27 the University of Munich celebrated the centenary of Schelling's birthday. Professor Hubert Beckers, a disciple of Schelling, delivered an oration "On the Development of Schelling's Philosophy," which has been published by the Bavarian Academy. Schelling was the

tutor of the late King of Bavaria, Maximilian, and though the philosopher spent his last years at Berlin, the real home of his philosophy has always been Bavaria and the South of Germany.

IT has excited some surprise that Mr. Carlyle should have declined the Grand Cross of the Bath, after having accepted the *Ordre pour le Mérite*. There is, however, a great difference between the two. The *Ordre pour le Mérite* is not given by the Sovereign or the minister, but by the knights themselves. The King only confirms their choice. Secondly, the number of the knights of the *Ordre pour le Mérite* is strictly limited (there are no more than thirty German and thirty foreign knights), so that every knight knows who will be his peers. In Germany, not even Bismarck is a knight of the *Ordre pour le Mérite*. Moltke was elected simply as the best representative of military science, nor does he rank higher as a knight of that order than Bunsen, the representative of physical science, or Ranke the historian. Besides, the honour comes *trop tard*. Goethe was twenty-seven years of age when Karl August made him a member of the Privy Council.

GERMANY, France and even a Western State in America have all their journals devoted to psychology and philosophy; and at last England is to have one. It was organised last year by Professor Bain, of Aberdeen, and is to be edited by his pupil Professor Croom Robertson, of University College, London. It is to be called *Mind: a Quarterly Review of Scientific Psychology and Philosophy*, and is to be published next October by Messrs. Williams and Norgate. The range of the new journal is to include Psychology, Logic, Aesthetics and Ethics, and the ancillary sciences of Biology, Language, Anthropology, and Mental Pathology: the philosophy of the inductive sciences, and a critical appreciation of the great philosophical systems of the past. Beside original papers, there are to be reviews, summaries of scientific work, news, and correspondence; and every writer, we are glad to hear, will sign his name to his contribution.

THE Early English Text Society was not able to complete the issue for its Extra Series in 1874 within the year, but it has now Henry Brinklow's two interesting tracts on the condition of England and London in or about 1545—"The Complaynt of Roderick Mors," and "The Lamentacyon of a Christen Agaynst the Cytte of London,"—nearly through the press, edited by Mr. J. Meadows Cowper, enriched with details about Brinklow's family by Colonel Chester, and they will be ready early in February, with *The Bruce*, Part II., edited by the Rev. W. W. Skeat, and *Early English Pronunciation*, Part IV., by Alexander J. Ellis, Esq., thus completing the Society's issue in the Extra Series for 1874. At the same time will be issued for the Reprints, *Merlin*, Part I., re-edited from the unique MS. in the Camb. Univ. Lib. by H. B. Wheatley, Esq. Together with the following for 1875:—a thick Part II. of the *Cursor Mundi*, edited by the Rev. Dr. R. Morris, for the Original Series; and Part II. of *The History of the Holy Grail*, edited by Mr. Furnivall, for the Extra Series. The other 1875 books for the Original Series will be chosen from *Thomas of Erildoune*, a print of all the MSS. in parallel columns, edited by Dr. James A. H. Murray (all the text in type); *The Lay Folks Mass Book*, edited by the Rev. Canon Simmons (all the text in type); *Palladius on Agriculture*, Part II., edited by the Rev. Barton Lodge (all in type but the Ryme-index); *Bede's Day of Doom, &c.*, edited by the Rev. J. R. Lumby, B.D. (all the text in type); *The Blickling Homilies*, Part II., edited by the Rev. Dr. R. Morris (all the text in type); *Sir Generydes*, Part II., edited by W. Aldis Wright, Esq., M.A.; *Meditacions on the Supper of our Lord*, perhaps by Robert of Brunne, edited by J. M. Cowper, Esq. (at press); *The Gawayne Poems*, edited by the Rev. Dr. R. Morris. The other 1875 books for

the Extra Series will be chosen from *The Bruce*, Part III., edited by the Rev. W. W. Skeat, M.A.; An Alliterative Romance of Alexander, edited by the Rev. W. W. Skeat, M.A.; *Early English Pronunciation*, Part V., by Alexander J. Ellis, Esq., F.R.S.; *Guy of Warwick*, from the Cambridge University MS., edited by Professor J. Zupitza, Ph. D. (the first of the Series of *Guy-of-Warwick Texts*). During 1875 will probably be issued these other reprints, both of which are now at press: Thynne's *Animadversions* (1590) on Speght's *Chaucer*, re-edited from Lord Ellesmere's unique MS. by Mr. Furnivall; *Merlin*, Part II., edited by H. B. Wheatley, Esq.

THE death of Mr. John Ashworth, of Rochdale, has deprived the poor of a true-hearted friend, and has terminated a very uncommon career. Born and reared in the depths of poverty, he managed to raise himself to a comfortable position as an employer of labour. In 1858 he established a "Chapel for the Destitute," and worked with great energy among the poor. The knowledge resulting from his intercourse with them is embodied in a series of narratives, issued under the title of *Strange Tales*, which have had an extraordinary popularity. To literary culture Mr. Ashworth made no pretension, and everything he wrote is strongly flavoured with "evangelical" piety; but the narrow theology is forgotten in the glimpses which these tales afford of the actual home life of the poor. Although many of these are indeed strange as to incident and character, we have the author's assurance that they are relations of facts within his own knowledge, and in one case only has his accuracy been even questioned. They were originally issued in pamphlet form, and of these over three million have been printed, beside 196,000 in volumes. Portions have been translated into Welsh, French, German, and Norwegian. His other works (*Walks in Canaan* and *Simple Records*) have also been very popular. He died in his sixty-second year, after a painful illness, for several months having been unable to partake of solid food. Of him it may be said,

"If thou wouldst know his real worth,
Go ask it of the poor."

A REMARKABLE collection of autographs, &c., was disposed of a week ago by Messrs. Sotheby and Co. Among them may be noticed a long letter of General Wolfe, written from Portsmouth, February 7, 1758, relating to the capture of Louisburg and other military transactions, which fetched nearly 20*l.*; a long historical letter of Matthew Prior went for six guineas; Prince Rupert, 3*l.* 13*s.*; a signature only of Sir Isaac Newton, 3*l.*; the same of Addison, 2*l.*; of Congreve, 1*l.*, and of Algernon Sydney, 2*l.* Five long letters of J. J. Rousseau on literary subjects, written in 1767, fetched from 2*l.* to 3*l.* each. Other interesting lots were:—Bishop Bossuet, letter to Madame d'Albert, 2*l.* 2*s.*; Anne of Austria, Regent of France, signature, 1*l.* 15*s.*; Villiers, Duke of Buckingham, a short letter, 2*l.* 6*s.*; a letter of Thomas Campbell, 1*l.* 11*s.*; of the Empress Catherine of Russia, 1*l.* 3*s.*; the sign-manual of Charles Prince of Wales (afterwards Charles I.), 16*s.*; Sir John Fastolf, governor of Normandy, 2*l.* 7*s.* 6*d.*; Grimaldi, the clown, 1*l.* 18*s.*; Queen Henrietta Maria, 1*l.* 4*s.*; Hogg, the Fitzrick Shepherd, 1*l.* 5*s.*; Herschell, the astronomer, 1*l.* 10*s.*; David Hume, two long letters, 4*l.* 8*s.* and 5*l.* 5*s.*; General Lafayette, 2*l.* 14*s.*; Ninon de l'Enclos, 1*l.* 14*s.*; Lorenzo de Medici, 1*l.* 9*s.*; Leonardo da Vinci, letter and two sketches, 5*l.* 2*s.* 6*d.* Three scrap-books, fitted with autographs of royal and distinguished persons, fetched 7*l.*, 27*l.*, and 31*l.* respectively. Nine letters, written from Kensington by W. M. Thackeray, were also in the catalogue; but these were withdrawn from the sale at the last moment.

THE Brockhaus firm at Leipzig has announced as forthcoming its twelfth edition, in fifteen volumes, of the now celebrated *Conversations-*

Lexikon, which has served as the model, if not the direct source, of so many other encyclopaedias. Two of the 180 separate parts of which the new edition is to consist are completed, and from these samples it would appear that the present edition has undergone such thorough revision and modification as to be almost a new work.

WHETHER a diligent perusal of the various articles to be contained in the new edition of the *Encyclopaedia Britannica* will endow a man, having a good memory and some power of tongue, with the varied information and conversational capacities of a Macaulay or a Whewell, would form the subject of a curious experiment. The announcement of this leviathan work reminds us of a passage in the writings of that most genial of American humourists, Oliver Wendell Holmes, wherein he tells us of a friend whom he found very rich in information one day, when they were in company. The talk ran upon mountains. He was wonderfully well up in the leading facts about the Andes, the Apennines, and the Appalachians; he had nothing particular to say about Ararat, Ben Nevis, and various other mountains that were mentioned. By and by some Revolutionary anecdote came up, and he showed singular familiarity with the lives of the Adamases, and gave many details relating to Major André. A point of natural history being suggested, he gave an excellent account of the air-bladder of fishes. He was very full upon the subject of agriculture, but retired from the conversation when horticulture came under discussion. So he seemed well acquainted with the geology of anthracite, but did not pretend to know anything of other kinds of coal. There was something so odd about the extent and limitations of this person's knowledge, that our humourist suspected at last what might be the meaning of it, and watching his opportunity, put the question, "Have you seen the New American Cyclopaedia?" "I have," said the other; "I got an early copy." "How far does it go?" The questioned individual turned red and replied—to Araguay. Oh, thought the questioner to himself, not quite so far as Ararat, and that's the reason he knew nothing about it.

THE Germans have lately founded a Körner Museum at Dresden, in which the place of honour among the relics of the young patriot-poet is given to a mandoline, which, under the name of a "lute," is intended to illustrate his well-known collection of poems, the "Lyre and Sword," ("Leier und Schwert"). We are informed that the wooden case in which Körner carried the instrument, as well as the ribbon by which he suspended it round his neck, has been secured for the museum. The poet's cavalry sword, which would have completed the symbolical interest of the collection, is unfortunately not likely to be obtained by the Dresden Körner worshippers, as it rests on the monument in the mortuary chapel of Wöbbelin which was raised in honour of the patriotic young lyricist, who at the early age of twenty-two added his name to the long list of those who in 1813 bought their country's freedom at the cost of their life's blood.

THE eminent jurist, Dr. von Planck, Professor of Civil Law at the University of Munich, has, at the earnest solicitation of the King of Bavaria, declined the chair which was offered him by the Leipzig University with such flattering marks of respect, and it is now understood that he will remain at his old post.

THE last number of *Unsere Zeit* (January 15, 1875) contains an eulogium of the late eminent philologist, Councillor von der Gabelentz, whose devotion to the study of languages the very names of which are scarcely known to ordinary readers, placed his attainments far beyond the scope of ordinary linguistic critics. Besides writing grammars of the Dakota, Dajak, Kirri, Kassia, Mantchow, Samojed, Syrjami, and Mongolian dialects, he was the first to elucidate for his countrymen the difficulties of the Finnic

tongues, while his critical expositions of the Gothic biblical translation of Ulfilas, and his Gothic glossaries and grammar, are invaluable additions to German linguistic literature.

WE have received *The True and the False Infallibility of the Popes*; a Controversial Reply to Dr. Schulte, by Dr. Joseph Fessler, trans. A. St. John, M.A. (Burns & Oates); *An Inaugural Lecture on Albericus Gentilis*, by T. E. Holland, B.C.L., &c. (Macmillan); *The Vatican Decrees in their Bearing on Civil Allegiance*, by Henry Edward, Archbishop of Westminster (Longmans); *On the Policy of Liberalism*, by Daniel Grant.

NOTES OF TRAVEL.

LIEUTENANT CAMERON'S map and journal, which were unaccountably delayed at Aden, have now arrived in this country. The map of Tanganyika, in five sheets, supplies an accurate delineation of that important lake. The survey has been executed with great care. Every cape and indentation of the coast is shown, and the mouth of every river. The names are all given, and pains have evidently been bestowed upon obtaining a correct rendering of the sounds uttered by the natives. Lieutenant Cameron had not seen Dr. Livingstone's work, and both the agreements and differences are interesting. The naval officer, working from a boat, has delineated the coast line in more detail and with more accuracy, while he shows the general correctness of Livingstone's work. All doubt about the discovery of the outlet to Lake Tanganyika by Lieutenant Cameron is removed by the arrival of the map. The Lukuga river, at the bottom of a large bay, is shown flowing out of the lake, and the course is delineated for a distance of four miles. A range of mountains intervenes between the outlet and the mouth of the river Rugumba (the Logumba of Livingstone), which flows into the lake between the Lukuga outlet and the Kasengé Islands. Lieutenant Cameron observed regularly for the variation of the compass, and his general direction of the lake agrees well with that of Livingstone. The distance from Ujiji to the south end of the lake, according to Cameron, agrees well with Livingstone's latitudes.

THE Portuguese Minister, Andrade Cerro, has, at the request of Viscount Duprat, sent orders to the Governor of St. Paul Loanda to give all possible assistance to Lieutenant Cameron if he should reach the west coast of Africa; and our own Foreign Office has sent similar instructions to Her Majesty's Consuls. We sincerely trust that the gallant attempt of the young officer, who has already done so much for geography, will meet with the success it deserves. The achievement will certainly be among the greatest and most important that have been performed within the present century.

THE appointments to the Arctic Expedition have at last been completed; and it has been settled that Commander Markham will be second in command of the advance ship with Captain Nares. The depot ship will be commanded by Captain Stephenson, who was promoted out of the Royal yacht, where he had been serving for the last two years, on the 5th of last month. The preparations at Portsmouth are progressing under the constant supervision of Sir Leopold McClintock, who is making all the arrangements with respect to sledges and sledge equipments in accordance with the plans dictated by experience and by long and careful thought respecting each detail.

A PAPER on the route of the Arctic Expedition by Smith Sound will be read by Admiral Richards at the meeting of the Geographical Society on Monday. It will be illustrated by a large diagram of the region extending from Cape Shackleton, at the entrance of Melville Bay, to the North Pole;

and a good general idea will thus be conveyed to the public of the course that will be taken by the expedition, of the difficulties that stand in the way of progress, and of the methods of overcoming them. We understand that the officers who have been appointed to the Arctic Expedition will be present, and it is well that the gallant young aspirants for Arctic fame should know how deep an interest is generally felt in their enterprise.

THE Chilean Government is making very laudable efforts to improve the charts of the coast of that republic. Three separate marine surveys have been organised. The *Chacabuco* frigate is to explore and survey the western channels of Patagonia, and the gulf of Peñas. The *Astao* will survey the coast from Mexillones, on the Bolivian frontier, to Caldera; and the *Covadonga* takes up the portion between Metaquito and Talcahuano. The original survey of the west coast of South America by Admiral Fitz Roy can only be looked upon as a preliminary sketch, and was avowedly merely intended to serve until a more complete survey was undertaken. This has never been done, and the action of the Chileans is, therefore, most useful to navigation.

On Monday last Staff Commander Hall, the Superintendent of Charts in the Hydrographer's Office of the Admiralty, read a very important paper, entitled "The Unsurveyed World," at the United Service Institution. He showed, on a large chart of the world, by means of three colours, the extent of coast that has been surveyed, the extent that has been only partially surveyed, and the extent that has not been surveyed at all. Commander Hall made a striking comparison between the condition of the naval surveying service a quarter of a century ago and its condition now. He showed that in 1850 there were at least a dozen officers qualified to command a survey, and as many surveying ships in commission; while in 1873 the number of surveying commanders could be counted on the fingers of one hand, and the surveying fleet had been reduced to one vessel. Meanwhile, the enormous increase in the mercantile marine, and in the number of ports that are made use of, had increased the need for accurate charts a hundred fold. This state of things is most disgraceful to our Admiralty, and it is to be hoped that Commander Hall's well-timed and very suggestive paper may mark the commencement of a reform. England, for many years, took the lead in useful work of this description, and her rulers are bound to take care that she does not lose her pre-eminence. Better accommodation for the Hydrographer's department is also urgently needed. The way in which it is now crowded into garrets is very discreditable.

THE exact determination of the longitudes of various West Indian and South American ports by means of the electric telegraph is about to be undertaken by the Hydrographic Office of the United States—a method which has already been used with success by our own officers in India and Persia. The work will be done by Lieutenant F. M. Green, U.S.N., of the steamer *Fortune*, assisted by Professor Miles Rock; and the instrument used is a combination of the transit, zenith telescope, and alt-azimuth, with a Morse register on which the transits of the stars are recorded astronomically, as well as the second beats of the chronometer, and the time signals. The party commenced from Panama to Colon in January, and go thence to Kingstown, in Jamaica, Santiago de Cuba, Havana, and Key West, where the longitude has already been determined to Washington. Next year the work will be continued to the eastward in the West Indies, and also down the west coast of South America.

WE regret to learn that the expedition which the Peruvian Government had equipped for the exploration of the course of the river Chanchamayo, a tributary of the Upper Amazon, with the view of deciding the practicability of carrying a railway to the Marañon, in that direction, has met with

a temporary reverse. One of the two boats engaged in the expedition was capsized, with the loss of all the instruments and provisions; while the other boat, which succeeded in advancing a few miles further down the stream, got wedged in between two projecting masses of rock, and had its deck swept clear of everything by the strong currents. The Government engineer, Werthermann, and Señor Rivero, who had command of the boats, have returned to Lima with their several crews, excepting one man who went down when the first boat capsized.

IN the course of an interesting paper on the routes between Herat and Khiva, read on Friday, January 20, by Sir Frederick Goldsmid, before Lord Lawrence and a distinguished audience at the United Service Institution, the gallant lecturer announced that General Abbott, who in 1839-40 successfully made his way from Herat *via* Khiva and Novo-Alexandrovsk to Moscow, had placed at his (Sir F. Goldsmid's) disposal for publication, a document of great geographical value, i.e., a route survey, made from the saddle, of the line of march from Herat to Khiva. This survey is especially valuable, as Lieutenant Shakespeare, the only other traveller who has left a record of a journey by this route, has not given us any information which would enable one to map out the precise line taken by him. In the event of a Russian expedition against Merv or the Teke Turkomans, such a survey would prove of importance.

THE new edition of Stieler's *Hand-Atlas* is rapidly approaching completion. It will appear in ninety sheets, or thirty parts, and of these seven were published last year, while the remaining five will appear before next summer. The work has elicited a warm encomium from Baron von Richt-hofen, president of the Berlin Geographical Society, particularly with reference to the excellence of the compilation as regards Tibet and the ground covered by the work of the Jesuit missionaries and Prshewalski, while one of the chief officers of the United States Engineer Survey has confessed that it is the best map of the western half of their territory. Again, Mr. E. Giles, a noted Australian explorer, makes the same remark of the portion of the map relating to that continent. These testimonials leave little room for doubt that the work is clearly a standard production.

THE January Statement of the Palestine Exploration Fund contains several valuable contributions to Biblical geography. The importance of Mr. Henry Maudsley's discoveries in Mount Zion will be better appreciated when some supplementary works have been undertaken. He deserves great credit for his generosity. Lieutenant Conder's discovery of some twenty towns in the south country has been already referred to in the ACADEMY. His merits are those of a skilled and accurate observer, and so far as the identifications depend upon these, and not also upon Semitic scholarship, they are well worthy of consideration. The same remark applies to Mr. Conder's negative views. The woods of Hareth and Ziph may be fictions, but the strength of the argument does not lie in the use made by him of the Septuagint. Mr. Drake's report, however, contains one identification, that of Zarthan with Tell Sarem, three miles south of Baisan, which is supported by a happy use of the Alex. MS. of the Septuagint. Mr. Drake says that there are no such names known as Bir and Shaikh Salim, with which Van de Velde identifies Amon and Salim. This is important. Mr. Conder identifies Nob with Mizpeh, and Gibeon, and all three with Nebi Samwil, the first half of the name being a corruption of Nob. This is difficult to swallow. Much more important are his papers on David's outlaw life, and on the Levitical city of Debir. In the latter he makes the valuable remark, that each of the groups of towns in Josh. xii. contains at least one royal city, and that the districts into which the country is thus divided will be found on inspection to have natural boundaries, still to a certain extent pre-

served. Hence the royal cities are important as indicating the locality of other towns connected with them.

By far the most conspicuous paper in the *Geographical Magazine* for February, is an article on the important exploration of Lake Namcho (or Tengri-Nor as it used to be called), to which we called attention in our last number. Owing to the extreme height of the plateau of Tibet, the inclement season (December), and the heartless manner in which they were stripped of their belongings by robbers, the party appear to have suffered greatly. Nevertheless, they have achieved a most important discovery, and one which we doubt not will meet with some substantial reward at the hands of the Royal Geographical Society. A very exhaustive notice of the geology, climate, natural history, and general character of the country about Disco Bay in West Greenland is contributed by the pen of Dr. Robert Brown, F.L.S. Accounts of the Nicolars, the most recent addition to our Indian Empire, and of Amsterdam Island, a solitary speck in the Indian Ocean, are furnished, as well as an amusing and characteristic article by Colonel Yule, entitled "Some Unscientific Notes on the History of Plants," which, by the by, deals exclusively with fruit-trees. Among the usual varied collection of notes, is one giving an outline of the scope and contents of the forthcoming work on Bogle's mission to Thibet (1774); and some important correspondence on the diseases to which Greenland dogs are subject supplies hints worthy of the careful consideration of those who have the control of the sledging arrangements in the approaching Arctic Expedition.

THE LATE LORD ST. LEONARDS.

IN Lord St. Leonards, who died on Friday week, within a few days of his ninety-fourth birthday, English law has lost its most profound oracle and its most dignified representative. At his funeral there were present none but his own descendants, and a few others whose personal connexion with him was very close; but in any other country but ours, such an occasion would have formed an opportunity for a public demonstration on the part of the profession, of which in learning, in position, and in years he was the acknowledged head. He belonged, indeed, not only to a generation which is passing away, but also to a class of lawyers who have not left behind them any successors. It was as a conveyancer under the bar that Mr. Sugden commenced his professional career, and it is with such men as Hargreaves, Fearn, and Butler that his name may most properly be brought into comparison. The old-fashioned intricacies of real property had produced for their authoritative solution a series of eminent practitioners whose learning and ingenuity built up a body of customs and rules, which, even more than the decisions of judges, formed the framework of conveyancing law, and has always been recognised from the bench. Of this series of great men Lord St. Leonards was the last, and perhaps the greatest; for the circumstances of his time, and his own superabundant energy, induced him to pass from the sphere of chamber practice, to which alone his predecessors had confined themselves, to that of a regular advocate in the Courts of Chancery, and occasionally also of Common Law. He published his first Law treatise, entitled *A Brief Conversation with a Gentleman of Landed Property about to buy or sell Land*, in 1802, and he first accepted a brief in 1808; but between those dates he had published both the two great books on *Vendors and Purchasers* and on *Powers*, on which his reputation rests. As an advocate he speedily raised himself to the highest rank at the Chancery Bar, and is reported to have earned in a single year as much as 20,000*l.* in fees. As a judge, it was his misfortune not to retain the Great Seal for more

than nine months, but as Lord Chancellor of Ireland, and in his place in the House of Peers, he performed a large amount of useful judicial work. It is, however, as a writer of legal text-books that his name will be best known to posterity, and it is probably in this capacity that he would himself most desire to be remembered. He was not one of those who win their first fame by re-editing an old-fashioned manual of practice, and then leave to their pupils the preparation of future editions. He chose for his first work a subject which is almost co-extensive with the substantive portion of conveying law, and in his preface to the fourteenth edition, which he brought out at the interval of half a century, he could say: "Every case cited I have perused in the original report, and every line of the book has been written by myself." It is well known also, that in his own copy he has noted up the reports of decided cases till the last year of his life, so that his executors may, if they please, issue a fifteenth edition at once.

Closely connected with his very merits as a lawyer, were his defects as a man. His early education would seem to have been much neglected, nor does he ever appear to have spared time from his profession to devote to general study. His literary style is not good, and his earlier works especially are destitute of form and order. As a legislator he was not successful, being indeed as much superior in legal knowledge to some of those who preceded and followed him on the woolsack, as he was their inferior in political ability. As a law reformer he cannot stand comparison with many of his contemporaries; and he was possessed by a profound horror of any fundamental innovations. In short, he was a consummate lawyer of the old-fashioned English type, but nothing more; for his own disposition, intensified by the faults of his training, prevented him from adding to this the character of a man of culture, or a statesman.

JAS. S. COTTON.

THE LATE DR. HITZIG.

DR. FERDINAND HITZIG died at Heidelberg on January 22, at the age of sixty-eight. Great as an Orientalist, greater as a biblical critic, he was greatest of all as a disinterested, truth-loving character. From first to last he never wavered in his adherence to that dry, but clear-cut, sternly moral Rationalism, which he had received from his university teachers, Paulus and Gesenius. He was not indeed without his faults. He could not be induced to learn from any other but himself. His love of far-fetched etymologies—not all of them, we may hope, intended seriously—makes his works, especially the later ones, unreadable—*ungeniessbar*—to a pure philologist. This application of that method of criticism, which seeks to determine the date of a book from internal characteristics alone, led him to many results, especially in his work on the Psalms, which are not likely to hold their ground. But he knew Hebrew well; he had an exegetical tact far surpassing that of Ewald or any other scholar with whom we are acquainted, and the substance of his works has become the common property of critics. Two of these deserves special recognition—his suggestive and absolutely unrivalled commentary on Isaiah (Heidelberg, 1833), and his contribution to the *Exegetisches Handbuch* on Jeremiah (first edition, Leipzig, 1841), remarkable for its judicious treatment of the complicated question of the text. But his brilliant capacities were already fully displayed in a still earlier work, *Begriff der Kritik an Alten Testamente praktisch erörtert* (Heidelberg, 1831). He also wrote on the Psalms, the Minor Prophets, Ezekiel, Daniel, the Proverbs, and—but last year—Job. His *History of the People of Israel* (Leipzig, 1869) is in the highest degree stimulative, but too Hitzigian, if we may be allowed the term, to produce much effect on criticism. His raids on the New Testament were also of too divinatory a character to be successful. Nor will students of Cuneiform acquit

him of arrogance and unscientific haste in his unfortunate essay on the Language of the Assyrians. But his faults were those of a generation accustomed to a less severe philology than the present. His virtues were his own.

T. K. CHEYNE.

PARIS LETTER.

Paris: Jan. 22, 1875.

The first volume of M. Fustel de Coulanges' great work on the *History of the Institutions of Ancient France* (Hachette) has just appeared. I can say, without fear of exaggeration, that its appearance is an event of real consequence, and will mark an important era in historical studies. With a profound knowledge of all the original texts, with a style of admirable clearness and precision, M. Fustel de Coulanges, already favourably known by his *Ancient City*, combines an originality of thought and a degree of mental penetration which allow us to place his name beside that of De Tocqueville. Like De Tocqueville, he belongs to the school of Montesquieu: he is a philosophic historian as well as a distinguished writer, and he would be as thoroughly in his place in the French Academy as in the Academy of Inscriptions. The volume which he has just published deals with the period from the conquest of Gaul by the Romans to the Merovingian epoch. It is not my duty to give you here either an analysis or a review, as you will doubtless devote a special article to the book, but I may very briefly summarise its general tendency:—according to M. Fustel de Coulanges, Germanic manners, ideas, and institutions have had scarcely any influence on the formation of mediaeval France; everything in feudal society that is due to previous traditions and influences comes from the Roman world; all that does not come from the Roman world is original, and was produced by the new social conditions that resulted from the disorder of the barbaric age. This idea—entirely opposed as it is to the theories now in vogue, which attribute Feudalism to Germanic influence—is developed in detail from many different points of view, novel, original, and often even bordering on paradox. M. Fustel de Coulanges will not want opponents; but whatever be the fate of his system, whoever takes up this question hereafter will have to reckon with him. His second volume, which will treat of Feudalism, is already in the press.

Generalising and creative intellects like that of M. Fustel de Coulanges are rare, and the majority of students must be content with a more modest, but no less useful part. Some publish inedited texts, others explore points of detail little or imperfectly known. It is a task of this kind that M. Lecoy de la Marche has just undertaken in his *History of King René, 1409–1471* (Didier). He has illustrated by a host of unpublished documents the adventurous life of this curious personage, who was Duke of Anjou and Lorraine, Count of Provence and Piedmont, King of Naples and Jerusalem; and he has thrown special light on the services rendered by him to the progress of the arts in France. Thanks to the Ecole des Chartes and the Ecole des Hautes Etudes, works of detail on the history of France are multiplying rapidly; while in the first special attention is paid to the study of charters and diplomatic documents, in the second the object more particularly kept in view is the criticism of historical texts, and the preparation of a two-fold series of works on the ancient period of French history, critical studies on the sources, supplemented by critical studies on each reign taken separately. Beside these two schools, various societies are being founded, which call forth the zeal of students. The "Society for the History of Paris and of the Ile de France," not yet a year old, which has M. L. Delisle for its president, already numbers 400 members. It publishes a journal every two months, and is about to issue the first volume of its Proceedings,

which will contain, among other curious discoveries, a plan of Paris in 1551, hitherto unknown, and a paper by M. Siméon Luce on the treaty between Edward III. and Charles of Navarre, which was published by Rymer under the wrong date of 1351, and which must be attributed to the year 1358. Another Society was established only a few days since, under the presidency of MM. Paulin Paris and de Wailly, at the suggestion of MM. Gaston Paris and James de Rothschild, for the publication of Early French Texts. This will be the pendant to the Early English Text Society, and the names which have presided over its foundation are a guarantee that its future is assured from the financial as well as the scientific point of view.

The zeal for the publication of historical and literary texts goes on increasing; it received its great impulse in 1833, when M. Guizot, then Minister of Public Instruction, created the Historical Society of France, which publishes four volumes regularly a year, and the Committee of Historical Works, under whose superintendence appears the "Collection of Unpublished Documents relating to the History of France." M. de Wailly, head of the department of sciences and literature in the Ministry of Public Instruction, has just traced in a Report (Imprimerie Nationale) the history of this collection. Beside the numerous and important volumes which have already appeared, he indicates those which are in preparation, among which may be mentioned the Cartulary of Cluny, the Works of Chrestien de Troyes, a very important collection of the Charters of Metz, the Gascon rolls preserved at London, and an Anglo-Norman poem on the Third Crusade, by the jongleur Ambroise, which is the original of the *Itinerarium Ricardi Regis*, so admirably edited by Mr. Stubbs.

Not only the State, but the town of Paris also, is publishing historical documents. M. L. Delisle is about to publish for the great collection of the "General History of Paris," undertaken at the cost of the Municipality, the third volume of his remarkable work entitled *Le Cabinet des Manuscrits de la Bibliothèque nationale*. The provinces are not behind the capital in their ardour for historical studies. The "Society of the Historical Archives of Poitou" has just published two volumes of documents; the newly founded "Historical Society of Aunis and Saintonge" is about to issue the first volume of its Proceedings. Finally, the "Society for the History of Normandy," established in 1870, has already issued six volumes, among which the most important are the two volumes devoted to the works of Robert de Torigni, Abbot of Mont St. Michel, and friend of Henry II., surnamed Plantagenet, which are as important for the history of England as for that of France. For this edition likewise we are indebted to the indefatigable M. Delisle.

Beside these various publications I must also call your attention to two volumes on *St. Louis and his Time*, by M. H. Wallon (Hachette), a conscientious and well-written work, like everything from the pen of this excellent professor and academician. It is, however, written from a strongly Catholic point of view.

I scarcely know whether to class among historical works a new book by M. Alphonse Ekiros, well known by the excellent studies on England which he contributed to the *Revue des Deux Mondes* while he was living in London during the Empire. Unfortunately M. Ekiros does not treat the history and politics of his own country with the same impartiality as those of foreign countries. His *Bonhomme Jadis* (Dentu) is a very black picture of the social state of France before 1789. The picture has often been drawn before, and M. Ekiros has not brought novelty enough to his task for the book to produce a great sensation. He will in no wise diminish the impatience with which we are waiting for M. Taine's work on the Revolution, the first volume of which is almost finished, but which very possibly will

be given to the public till the whole is complete.

In this same domain of historical studies the part is advertised for an early date of two important publications, which cannot be completed a distant day. The first is a re-edition of *testant France*, a biographical encyclopædia of French Protestants of distinction, published by . Haag between 1846 and 1858. These two volumes, whose learning was only equalled by their lustre, lavished upon this work not only all pecuniary resources, but the utmost devotion and perseverance. Not until a very late period they receive from the public the support which they deserved. Isolated as they were, without the ordinary means required for so vast an enterprise, they could only produce a work imperfect in many respects. The "Society for the History of French Protestantism" has now undertaken to recast the previous edition of *Protestant France* on a much more extended scale, whereby its dimensions will be nearly doubled. Most all the articles will be corrected and supplemented, and a great number of new articles will be added to the old. A committee has been constituted to superintend the enterprise; but the sole honour of the work will redound to its president, M. Henri Bordier, who has an equal knowledge of the French Archives and of the history of French Protestantism. With rare disinterestedness he has devoted himself wholly to this work, without thought of any other reward than the honour of its accomplishment. It will be in three volumes, and will take from twelve to fifteen years to complete. The first part of the first volume is printed, and is about to be issued by Messrs. Sandoz and Fischbacher. The second of the publications on a large scale of which I am speaking is a great work on general geography, the execution of which has been entrusted by Messrs. Hachette to M. Elisée Reclus, author of the splendid work of geology and natural history entitled *Terre*, and an exile from French soil through unfortunate participation in the events of the Commune. His new work will be entitled *Terre et les Hommes*, and, although it is already in an advanced state, and the first part is to appear immediately, it is impossible to predict at its range will be. Geography at the present time is being constantly renewed, and is accumulating year by year fresh information and new materials.

An item of news which concerns historical studies in the highest degree is the sale which has just taken place of the complete works of Michelet. Messrs. Michel Lévy have become the proprietors of the sum of 56,000 francs. Thanks to a judicial decision just pronounced, by which the right of perpetuating the future editions of M. Michelet's works has been secured to his widow, we may hope that the papers left by the illustrious historian will be utilised. He leaves no unpublished work in manuscript; but his notes contain a quantity of interesting jottings which will serve to correct and to enrich new editions of his works. He had completely recast his *Origines du Droit*. He has left a portfolio full of materials for a History of Paris. He had made a complete abstract of the papers of the Commune of Paris during the Revolution, an abstract which has attained a high value since these papers were burnt by the Commune of 1871. Finally, there are in his private notes and in his journal many reminiscences of travel, in which the countries and antiquities visited are seen and studied in the light of history. Thanks to these notes, and the journal which M. Michelet kept uninterruptedly throughout the whole of his life, and which is now the special property of his widow, M^{me}. Michelet, with the help of her own recollections, will be able to supply a biography of her husband which will have the interest of an autobiography. Therein will be seen in all its beauty the soul of this man of genius, who, as the world will perhaps be surprised to hear, long made it his daily rule to read

a chapter of the Gospel and to practise mathematics. As to Michelet's correspondence, it might serve for his biography, but it will not afford material for a special publication. He always wrote very briefly, a few notes full of life and feeling, but without any attention to style; he never indulged in dissertations by letter; an extensive correspondence would have seemed to him a distraction and waste of thought. He was in this respect the very reverse of Proudhon, who carried into everything the temper of a publicist and a polemical writer, and found in the various branches of his correspondence little else than so many newspapers with more familiarity and less restraint. Three volumes of this correspondence have already appeared; the fourth, bringing us to the period of the Empire, is about to be issued. The interest increases with each volume, so great is the power of prevision displayed by the powerful intellect of Proudhon in the midst of the troubles into which the Revolution of 1848 had plunged the public mind.

History has so carried me away that I have scarcely any time or space left to call your attention to a few interesting novelties in other domains—not in that of literature strictly so called, which continues as barren as before. The only event which has made any noise, has been the preface written by M. A. Dumas fils for a new edition of *Manon Lescaut* (Glady): unfortunately, the noise arises not from the admiration, but from the scandal caused by this preface. M. Dumas has constituted himself during these last times a preacher of morality; he has even become somewhat mystical, and preaches a new religion with closed doors; but he speaks of morality with the same freedom from restraint, the same sensuality of tone, as might be assumed by a preacher of immorality. Nay, the more austerity he affects in his principles, the more free and easy does he become in his expressions, and he preaches his Gospel in accents which would only pass muster in the guard-house or worse. This absence of good breeding and of good taste is the most remarkable feature in the preface in question, which will only live by reason of the splendour of the edition which it accompanies. In point of literary talent, M. Dumas has sensibly deteriorated during the last few years. May we expect him to reach a higher level again in his *discours de réception* at the Academy? Meanwhile this speech, though not yet delivered, is already making a great noise. It contains, under the form of a eulogy of A. Dumas père, a sharp lesson addressed to the Academy, which would never admit him to its bosom. It is doubtful whether the venerable assembly will submit to be thus lectured, and it will be difficult to make an author yield who, though he has lately taken up with the belief in a God, has none the less preserved the fervent faith which he has always had in himself.

In the midst of our poverty in the literature of the imagination, it is toward serious books that we must turn to find work of interest. In this number will certainly be the work about to be published by M. Schuré on *The Music Drama*. The first volume will be devoted to the lyrical drama of the Greeks, the liturgical dramas of the Middle Ages, and the history of the Opera. The second volume will treat of the ideas and the works of Richard Wagner, who, according to M. Schuré, has in his compositions, in which the lyrical and the dramatic are combined, realised with the modern sentiment the ideal dimly discerned by the Greeks. M. Schuré, who as an Alsatian combines the intellect of Germany with a literary genius which is thoroughly French, is perfectly qualified to be the interpreter to the Parisian public of Wagner, against whom the national prejudice is just at present very strong, but who has won over to his side in the world at large the younger musicians and many passionate admirers.

M. Renan, too, has been one of the interpreters of Germany. When he had to oppose her pen

in hand, he did so with a breadth and equitable spirit which his adversary Strauss failed to preserve. He will publish very shortly a volume which will be in the main a reprint of his philosophical articles in the *Revue des Deux Mondes*, but which will contain also a great philosophical essay, which all the lovers of good style and noble thoughts are already anticipating the pleasure of reading. We fear, however, to find in it that disdainful dilettantism, that contempt of men, that vague and ineffectual groping after an ideal not to be realised, which is the habitual philosophical note of M. Renan. His transcendental scepticism tends to the negation of action, and to the egotistic contemplation of the world and of self. The brilliant variations which M. Renan is wont to execute on this theme appeared charming in the time of the Empire to minds that were utterly disgusted and disillusioned; but now, after so many cruel experiences, we need more masculine and more vivifying principles. In pursuit of these some turn toward scientific research, others would fain renew spiritualism, and give it a more solid basis. Hence, a twofold philosophical movement of deep interest, of which I have not time to speak to-day, but which, with your consent, shall form the subject of a future letter. G. MONOD.

CORRESPONDENCE.

THE FIRST BOOK PRINTED IN SPAIN.

Upton, Essex: Jan. 27, 1875.

Permit me to give the following notices with regard to page 88 in the number of January 23, 1875. As the first book printed in Spain, I find: Bartolom. Mates, *Libro pro officio orationibus sec. artis gramm. leges* (25 folios, 8vo, 1468. Barcelona). And as the first printer in Barcelona, Joannes Gerling, Alamannus. Both notices are to be found in *Die Druckorte des XV. Jahrhunderts und die Erzeugnisse ihrer erstjähriger typographischer Wirksamkeit* (Augsburg: F. Butsch. Published by the Benedictine Father, Gottfried Reichhart). In the same catalogue I find: Valencia. Bern. Fenollar, *Certamen poetich en lahor de la Concepcio*,

4to, 1474, which is very probably the same work as that mentioned in your number of the 23rd inst.

A PEHLEVI MS. RECOVERED.

Oxford: February 2, 1875.

Many years ago, not long after my arrival in England, the late Professor H. H. Wilson gave me a portion of a Pehlevi MS., containing Sanskrit, Persian, and Pazend translations, and asked me to find out what it was. He had for the same purpose given other portions of that MS. to other scholars, but, as far as I know, he never himself published any account of the MS. and its contents. From a letter, dated December 3, 1836, it is clear that the MS. was originally sent to Professor Wilson by Mr. Romer, a gentleman who took a warm interest in Zend literature, and published several essays in order to prove that Zend was an artificial language. I give this letter, as it contains some interesting notices:—

"13 Cambridge Terrace, Regent's Park: Dec. 3, 1836.

"Dear Sir,—I have now the pleasure, herewith, to send you the duplicate part of Moolla Feeroz's book, containing extracts from the *Deen-kurd*, and a short account of the work.

"To these I have added a few sheets of an unfinished polyglott copy of the *Boon-dihish*. This I had made for me at Surat, with the design of comparing the Puhluwee with the Zund, and both with Sanskrit—an object hitherto unaccomplished—from my want of a competent, I ought rather to say any knowledge of these languages beyond that of their letters.

"The original Puhluwee stands to the right, on the right-hand page, then the Zund version—both being underlined by transcriptions of their characters in modern Persian letters, so far as this can be done in the absence of letters to represent the short vowels, all written at length in the Zund, though not so in Puhluwee, which in this respect is the same as Persian. Next, the Sanskrit translation, and lastly one in modern Persian.

"The Zund version and Persian translation were made by a Parsee Dastoor employed for the purpose. The Sanskrit is transcribed from some of the old translations in this tongue extant among the Parsees. Of what age it I cannot say—nor am I able to judge of its purity—or whether it appears to be or bears any mark of Hindoo or foreign composition, or whether it is not a *Prakrit*—points which you, at once, will determine.

"May I likewise beg your acceptance of a duplicate copy I had made of the inscriptions on the *Nugsh-i-Roostum*, underlined with modern Puhluwee letters, to show how far they approximate to or diverge from the ancient characters; and should the Boondihish be found worthy your attention and interest you, what I have, consisting of a few more *jooz*, is much at your service.

"I am, dear Sir,

"Yours faithfully,

"H. H. Wilson, Esq."

"J. ROMER."

"The following dates professed to be those in which the original *Deen-kurd* and the copy were written, I had extracted in the handwriting of its owner, from a very old MS. of the book at Surat:—

"I, Mawundad, son of Buhran Mihiban, finished this book, *Deen-kurd*, on the day *Deen* (24th) of the month *Teer* (fourth) in the year of Yuzdjird 369'—30th July, 999 A.D.

"I, Shuhuriyar Urdsher, son of Eerich, son of Roostum, son of Eerich, son of Korbad Eeranshah, finished writing this copy on the day Oormuzd (12th) of the month Isfundamoorz (twelfth), in the year of Yuzdjird 865'—1st November, A.D. 1496.

"The late Moolla Feeroz, with reference to the antiquity and authenticity of this book, quoting the third Dufur of it in his treatise named *Kitab-i-Uweezukh-Deen*, says: The translator of the *Deen-kurd* from Greek into Puhluwee himself states that the original *Deen-kurd* was written in the time of King Gooshtasp, and that the book in Puhluwee, now known by this name, is not the original *Deen-kurd*, that book having been burnt by Alexander. That translations of it into Greek, made by order of Alexander and afterwards of Ardsher Babagan, were, however, preserved, and remained extant until Persia was conquered by the Arabs. That subsequent to this event the reliques of these ancient and worn-out transla-

tions coming into the hands of a learned man named Adurbad, he formed from them the compilation of a new book in *Puhluwee* as intelligible as he could make it from such materials. It is, nevertheless, doubtful, according to Moolla Feeroz, whether the *Deen-kurd* extant is the work of Adurbad (the supposed time of whose living is not mentioned) or of some other person. However this may be, the name of the author is given in the text with the date of writing the original, and that of the copyist with the date of the copy, as is shown above. Moolla Feeroz mentions another copyist, named Mawundad Buhran Urdsher Toorkabad, as writing A.Y. 1009 or A.D. 1639, and that the work, as it now exists, was brought into India from Persia.

J. R."

I showed the portion of the MS. which was left in my hands to several Pehlevi scholars who came to visit Oxford, Professor Spiegel, Professor Haug, Dr. West, and they all agreed in their regret that so interesting and, in some respects, unique a work should have been dispersed, and part of it probably altogether lost. Dr. West, one of our best Pehlevi scholars, wrote the following account of the MS.:—

The accompanying twenty-two folios of polyglot (Pahl.-Paz.-Sans.-Pers.) MS., pages 32-63 and 82-93, contain about one-eighth of the *Shikand-gumani Vajär*, or "dispelling-doubt exposition," one of the later Pahlavi works on the physics and metaphysics of good and evil. Its author calls himself *Mardān-farūkh-i Aūharmazdād*, and states that he has collected his arguments from the writings and records of the ancient learned, especially from the *Din-khird* (now unknown) of the blessed *Ādar-Pādiyāvandān*; he has also studied the *Din-kard*, in a thousand chapters, of the most learned *Ādar-Frōbāk-i Farākh-zādān*, and the *Rōshan* of the blessed *Rōshan Ādar-Frōbāgān*. In the earlier part of the work he replies to questions which had been propounded to him by his friend the all-successful *Mihryār-i Māhmāzān* of Isphāhān (see pp. 37 and 38).

There appears to be no complete MS. of this work in Europe, but the longest is a Paz.-Guj. MS. in Professor Haug's library (H 19); it starts from the beginning, but breaks off abruptly at the end as if unfinished.

Anquetil's MS. at Paris (P 18) is Pahl.-Paz., and extends from I. 1 to V. 92, which is only two-fifths the length of H 19.

A MS. copy of the Pahl. text of Dastur Hoshangji's edition, sent to Professor Haug, is no longer than P 18.

A copy of the Pahl. text, extending from I. 1 to V 70, occupies the last thirty-six folios of the London India Office Library MS. (L 15); this is three-eighths the length of H 19.

And the India Office Library MS. (L 23) is a copy of the Paz. text, beginning with I. 34, and extending to one-half the length of H 19.

The Copenhagen MS. (K 28) is Pahl.-Paz.-Sans., but is very imperfect, as fols. 17, 18, 23, 24, 49-96, 105, 106, 111-120, 130-135, 137, and all beyond are missing; but its length has not been compared with that of H 19.

The accompanying twenty-two folios contain the Pahl.-Paz. text from I. 51 to IV. 1, and from IV. 28 to 60, and the Sans.-Pers. text from I. 47 to III. 34, and from IV. 20 to 56, or one-eighth of H 19. The Paz. version has evidently been copied from a previous MS. like the Pahl. and Sans.; and the Pers. paraphrase is probably too carefully composed to be the off-hand work of the actual copyist. This paraphrase contains many additional explanations and some interesting legends such as the following (p. 46, bottom):—

"It is declared in the religion that, in the days of King Gushtāsp, the righteous Zaratusht, the apostle, had brought a fire from the Court of Aūrmazd, the lord; it was ever brilliant without fuel, and in the council-chamber of the King all men joined hands, and there was no burning; that fire, in the days of Alexander went back to heaven. And the fire of heaven, which is warm and brilliant, had no burning in it; but the fire of hell is from drought, and the burning from smoke, in which there is no light; and

in this double-natured world, the fire of drought became mingled with the fire of warmth, whereby burning became manifest; that which is light is from Aūharmazd, and that which is smoke is from Ahriman."

Page 90, bottom:—

"Every time rain should fall, the demon Spōzgar becomes terrible, and forms a barrier, so that rain would not fall in the world till the creatures should die; and the star Tishtar, who is superintendent over the rain, in order to make rain fall in this world, quarrels with the demon Spōzgar (Z. Spējaghra), and offers him battle and defeat, so that rain begins to fall in the world and makes the world habitable."

Page 92, top:—

"And the fire named Vājist (Z. Vāzishta), which is an angel who at the time of rain struggles with the demon Av-ush (Z. Apaosha), and the conflict is such that the fire Vājist, which they therefore call the fire of lightning, becomes suddenly flashing and brilliant from weapons of surprising splendour, such as sword and club, &c., which offer battle and defeat to those demons (v and Ush formed out of the one Apaosh apparently) till they become feeble and flee; then those weapons hurl flashes at the backs of the demons, so that wherever the lightning of the weapons falls, the place is quite burnt; then the rain falls heavily. In this manner always are the conflicts with the demons Av-ush."

These legends are not in the original Pahlavi, which merely alludes to the last two.

When after the death of Mr. E. Norris, his library was sold, no trace appeared of the missing MS. I then wrote to Dr. Rost, an intimate friend of Mr. Norris, and asked him to make enquiries; and I am glad to say that, after some further researches, some of the missing leaves have now been found. In order to secure so valuable a MS. against further accidents, I have handed over my portion of it to the library of the India Office, as the most likely place in which Mr. Romer and Professor Wilson would have wished the MS. to be kept, and I am able to announce that the other portion, which belonged to Mr. Norris, has likewise been secured for that library. Thus, after some perilous vicissitudes, the MS. has found a safe resting place, where, however, I hope it will often be disturbed by Pehlevi scholars.

MAX MÜLLER.

P.S. I take this opportunity of enquiring whether there are now living any relatives or friends of the Rev. Dr. Stevenson. He lent me a most valuable MS. of Sāyana's Commentary on the *Rig-Veda* (B. 1), and in a letter, dated Ladykirk Manse, January, 1856, gave me permission to keep it till my edition should be finished. Dr. Stevenson is dead, and I have therefore deposited the four volumes of his MS. in the library of the India Office, where at any time they can be claimed by his relatives or friends.

OUR OLDEST MANUSCRIPT AND WHO MUTILATED IT.

Clapham: February 2, 1875.

I was wrong, it seems, in supposing that Mr. Ffoulkes was unacquainted with Dr. Maassen's great work. But how could I refrain from this supposition on finding no allusion to so eminent a name in an article which says that "the credit of having brought" the manuscript "to light, rests with Sir Duffus Hardy"? Still less could I have imagined that Mr. Ffoulkes should have even glanced at the mass of evidence which Maassen's book contains without feeling conscious that the whole stand-point of his article was a mistaken one.

In reply to my remarks on the date of the manuscript, Mr. Ffoulkes refers me to words of his from which I may see that he "distinctly confines himself to the characteristics and contents of vol. ii." My answer is, that the three volumes were originally one. They formed a single manuscript,* written throughout by one and the same

* Cod. 3,688 begins with the last three leaves of the final quire of Cod. 3,686. This is to be seen from the numbering of the last leaves of each quire.

hand. The writer lived, not before, but after Dionysius Exiguus, in the sixth century, whom he copies. His manuscript, therefore, could not have been written "shortly after the termination of the fourth council." It is not "the oldest manuscript of the oldest collection of canons in Latin known." The collection to which it belongs is not the oldest known, it is not even the oldest but one.

I called it a mistake to talk of the *Prisca Versio* of the Sardican canons. Mr. Ffoulkes says that "the fact of their being included in the *Prisca Versio* rather indicates that, as they stand there, they were translated like the rest in this volume by its author from a Greek version." The whole of this rests upon exploded error. They are not included in the *Prisca Versio*. The rest of the volume was not translated by its author from a Greek version. It has been proved to demonstration that the so-called *Prisca Versio* of the Nicene decrees is no version at all, but a compilation from two more ancient texts. One of these texts is the version sent by Atticus of Constantinople to the African church, and the other is an extremely ancient version, contained in the Codex Teatinus—the same MS. to which Mr. Ffoulkes alludes at p. 142 of his article, under its designation as MS. Vatican, Reg. 1997. It is not wonderful that he sees a likeness in its text to what, after De Marca, Justel, and Ballerini, he calls the *Prisca*, but he reads the likeness the wrong way. It is the parent, not the offspring of the Bodleian text, as far as regards the Nicene decrees. Its text is exactly the same as that of the Bodleian as regards the decrees of Ancyra, Gangra, &c., but not of Sardica. In this Codex Teatinus, the Sardican decrees immediately follow the Nicene, "in consecutive numbers," and without being distinguished from them in any way. The last Sardican canon is followed by the catalogue of the Nicene bishops, and this by the final clause *Explicit concilium Nicaenum*. Of the four different recensions which are known of the Sardican decrees that contained in the Codex Teatinus appears to have been that upon which the *Compendium* of Pope Zosimus was based. The present MS., of course, is more recent than the time of Zosimus, but the recension is demonstrably much more ancient than the MS., because it has been made use of by Gaulish collections of great antiquity. This is not the only collection in which the Sardican canons immediately follow the Nicene, either "consequentibus numeris," or without any numbering. There is actual proof of the existence of such a method in every collection which can be traced to an earlier time than Dionysius Exiguus, and this is in perfect harmony with the fact that even the most learned Latin writers of the fifth century like St. Jerome, knew the Sardican decrees only under the name of Nicene.

Mr. Ffoulkes, at p. 142 of his article, is shocked at the omission of the last Nicene canon. This canon is omitted in a large number of Latin versions perfectly independent of each other. It must, therefore, have been omitted in the Greek copy or copies from which these versions were made.

Mr. Ffoulkes says that he is aware of the copies of the *Bibliotheca Juris Canonici* possessed by the Bodleian Library, and of the one to which I refer in particular. "But this copy contains more than Dr. Maassen gives it credit for containing, and thereby disposes of his conclusions." Will Mr. Ffoulkes excuse me for saying that this is no sufficient reply to my objection. He must be more explicit. I assert that De Marca's intervention consisted in compelling the editors of the *Bibliotheca* against their will to insert the Sardican fragments, not, as he suggests, to suppress a portion of them. It is known that the edition was already in the press when the publication was stopped by authority. Now, every known copy except one bears evidence that two leaves have been cancelled, and the text altered on the leaves which have taken their place. In each of the British Museum copies the remains of the two cancelled leaves are per-

fectly visible. In the unique copy of the Bodleian the Sardican decrees are suppressed. In every other copy certain Sardican fragments are inserted, and the room for them is obtained by printing the names of the Nicene bishops in small type and in three columns. Does Mr. Ffoulkes mean to deny that the Bodleian copy represents the older and suppressed edition? How does he account for the difference between the copies? I do not know what he means when he says "this copy contains more than Dr. Maassen gives it credit for containing." It probably contains the prefaces of the revised edition; Maassen's observations and mine only refer to the contents of the leaves which have been altered. The old leaves may have accidentally been bound with the revised volume.

"There is not a particle of reason," I have said, "for doubting the strict accuracy of Baluze's narrative." There is surely no inconsistency in my speaking "in the same breath" of "a mistake of Baluze, who confounds the MS. now in the Bodleian with another MS. of C. Justel." This mistake is no part of the narrative beginning with the words, "When those very distinguished men, W. Voel, &c. What Mr. Ffoulkes calls "repeating the fiction of consecutive numbers" is not to be explained by supposing that Baluze took De Marca's account of the MS. upon trust, and did not see it, otherwise we should have to believe that he never saw the printed copy, which disproves the "consecutive numbers" quite as effectively as the manuscript itself.

My denial of the identity between the Bodleian MS. and that described by De Marca is no "theory of my own," propounded for the purpose of invalidating certain reasons of Mr. Ffoulkes.* The characteristics of the two MSS. are completely different, and this is a sufficient reason for denying their identity. One represents a higher degree of antiquity than the other. Where the MS. described by De Marca can be found I cannot say, for the elder Justel's rich collection of MSS. was dispersed, and some of them may be lost. But others like that in question are perfectly well known. In the "Freisingen fragment," for instance (which is found in two MSS.), *Incipit Nicenum Concilium* is followed by Nicene and Sardican canons "consequentibus numeris, sub antiquo titulo," without any mention of Sardica. How many Sardican canons were included in this collection I cannot say, but the Freisingen MS. which contains the fragment I have just mentioned also gives a collection which contains "canones unum et viginti concilii Sardicensis duobus capitibus in unum compactis." And it is not the only one.

I conclude, like Mr. Ffoulkes, with a reference to the assertion, sanctioned by De Marca, that the missing leaves of the MS. "vetustate perierunt." I deny that this is "absolutely false on his own showing." Mr. Ffoulkes has not refuted my suggestion that the MS. may have been imperfect long before it came into Justel's possession, and that De Marca's assertion that Justel cut away the Sardican canons is as easily understood of fragments as of the entire text. "On his own showing," what had been cut away was actually restored to its place. You must explain one portion of his words by another, unless there is a contradiction between them. And there really is none.

P. LE PAGE RENOUF.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Feb. 6,	3 p.m.	Royal Institution: Mr. J. T. Wood, II.
		" Crystal Palace Concert (Joachim).
		" Saturday Popular Concert, St. James's Hall (last appearance this season of Bellow).
	8 p.m.	Royal Albert Hall: Ballad Concert (Sims Reeves, Wilhelm).
MONDAY, Feb. 8,	5 p.m.	London Institution: Professor Ferrier, II.
	8 p.m.	Medical.

* Maassen, who certainly never foresaw this controversy, points out Baluze's error. (*Quellen*, p. 87, note. See also p. 65.)

SCIENCE.

PLATTS' HINDŪSTĀNĪ GRAMMAR.

A Grammar of the Hindūstānī or Urdū Language. By John T. Platts. (London: W. H. Allen & Co., 1874.)

Few languages have more claims upon our consideration than the Urdū, or, as it is more commonly called, the Hindūstānī. Its political importance as the *lingua franca* of the whole of our Indian Empire, as well as the mother-tongue of the greater part of the Mohammedan inhabitants of the North-Western Provinces, cannot be over estimated, while to the philologist it presents many most interesting points for investigation. It was long the fashion to speak slightly of the "jargon of the Moors," as a previous generation of Anglo-Indians termed it, and the eminent De Sacy himself is credited with having spoken of it as "cet idiome méprisable," although his pupil, M. Garcin de Tassy, the well-known author of the *Histoire de la Littérature Hindoustanie*, has vindicated his master's reputation from the suspicion of such a blunder.

A composite language Hindūstānī undoubtedly is, but it is to this very circumstance that it owes its copious vocabulary and vast power of expression. Like English in this respect, it borrows words and idioms freely from languages belonging to distinct families, and this naturally makes it difficult here and there to account satisfactorily for a form or construction; but, as Mr. Platts says, "there is little in the structure of Urdū of the loose and arbitrary character which some recent writers on the grammar have attributed to it."

Before the time of the English conquest Urdū had no literature of its own; indeed, it had at that time scarcely risen above the rank of a jargon; but during the last few years its literature has grown to an enormous extent, and as it consists chiefly of

translations or imitations from English or Persian, it is peculiarly interesting as a point where Eastern and Western ideas can meet upon common ground. M. Garcin de Tassy has done ample justice to this development of the literature of the language both in his *Histoire* (above alluded to), and in his annual discourses at the Ecole Spéciale des Langues Orientales Vivantes, which contain a complete record of its progress from year to year; but until the appearance of the present work, nothing like a scholarly or exhaustive treatise has ever been attempted to be written upon the language itself.

The older grammars of Gilchrist and others were merely the first attempts to bring order out of chaos. Forbes's grammar (like most of the lamented Doctor's works) was sadly deficient in scholarship and research; the more recent grammars of Monier Williams and Professor Dowson approach much nearer to the modern standard of excellence; but Mr. Platts is the first who appears to have thought of teaching the language rather by an analytical investigation of its structure than by a synthetical account of its rules.

From this point of view, his disquisitions on the derivations of words, and especially those parts which relate to the origin of the inflections and case-endings, are most valuable.

The chapter (p. 203) on the Hindi themes derived from the Sanskrit through the Prākṛit, I would particularly recommend to the student. A rational analysis of the principal forms in a language is the best *memoria technica* for the vocabulary and inflections.

Comparative philology and comparative grammar are no doubt interesting for their own sake; but a science without practical application would attract but few votaries, and the legitimate use of the sciences just mentioned is surely that of facilitating the acquisition of languages.

As Urdū has materially altered during the last few years, the author has done well in selecting his examples from modern works and newspapers, as well as from the old standard books, the style of which is often obsolete. Indeed, it was impossible for such works as the *Bāgh o Bahār* and the like to maintain the position of classics which it was sought to thrust upon them; in the first place, the books were mere translations; and in the second place, the language itself is in too transitional a state to have a standard classical style at all at present.

The article on the derivation of the numerals (p. 49) is a very useful one, and brings into order what appears at the first glance to be hopeless confusion. Without some such intelligent analysis to guide him, it is exceedingly difficult for a beginner, even with a good memory, to use the Urdū numerals with anything like facility. The nicely lithographed table of the *rakm*, or numerical ciphers used by the Indian accountants, is also an acquisition to the learner; here, again, the memory is greatly assisted by the fact being pointed out that these apparently arbitrary signs are in reality abbreviations of the Arabic words for the numerals which they represent.

In the account of the pronouns Mr. Platts is quite right in putting *un ne* as a *singular* form, but I doubt whether there is any good authority for its use in the plural without some word intervening between the pronoun and the post-position. The formative *unhon* would, I believe, be always used with such post-position. Major Otley was the first to point out that *un ne* was a euphonic change for *us ne*, and not, as all previous grammars asserted, a plural form.

Another correction in the present work is giving *yih* and *wuh* as alternative plural forms for *ye* and *we*; but this, perhaps, is rather a change introduced by modern usage than the correction of an error.

There is room for improvement in the explanation given of the function of the agent in *ne* with the past indefinite tense of a verb. No doubt this peculiar construction was originally passive, and represented the Sanskrit instrumental case with the passive verb. But, in Urdū at least, it has long ceased to retain a passive signification; the particle *ne* has become the true sign of the agent, while the very fact that it can only be used with the past tense of a transitive verb proves that the construction is now essentially an active one. Mr. Platts (p. 141) translates the words *rājā-ne shernī mārī*, "by the king a tigress was killed;" but if we follow out the analogy of this translation, we shall meet with constant anomalies and exceptional constructions. The literal rendering would rather be *the king (agent) tigress-killed*, where the action and the subject thereof are considered together as in our own phrase *tiger-killing*. If the action of killing be predicated of the agent, and the object on which such action falls be separately and subsequently considered, the verb instead of being made to agree in number and gender with a subject, is used in the simple uninflected form, and the object is expressed by the use of the proper objective case; e.g., *rājā-ne shernī-ko mārā*.

Whatever may be the etymological history of the construction, it is certain that the above is practically the principle on which it is employed, and that attention to the distinction between the subjective and objective cases will prevent many misconceptions upon a rather puzzling set of idioms. I must add that by *subject*, I mean the thing in connection with, or by reason of which the action takes place as distinguished alike from the agent or the mere nominative.

Half the difficulties in explaining Oriental idioms arise from the assumption that the rules and terminology of European grammatical systems apply to, or are identical with, those of the Oriental systems. To ensure accuracy we must investigate, if not indeed follow, the system by which natives are guided in their estimate of the correctness of an idiom, and we must be very careful that in translating its terminology we do not make use of terms borrowed from our own system, and possessing technical significations which really mislead. For this reason it would be well, if in future grammatical works on Oriental languages the use of such terms as *nominative*, *accusative*, *adjective*, &c., were discarded in favour of some more precise and less technical terms.

For the paragraph on the passive voice

Mr. Platts deserves much praise. I do not know any other writer who appears more thoroughly to have grasped the nature of this construction. In most Aryan languages the words for to *be* and to *go* have a great tendency to interchange, and the word *jānā* is no exception to the rule; thus it is that verbs construed with this auxiliary may very often be rendered by a passive, but very useful is the warning (p. 372) against mistaking such expressions as *mujh-se dekhā nahīn jātā*, "I cannot bear to see it," for passives, as most of the previous grammars do. Pp. 61-113 are occupied with a dissertation on Persian and Arabic constructions which occur in Urdū; this part of the work is concise, though sufficiently full; but its value would have been much enhanced by tabulating the forms to a greater extent than has been done. This remark applies especially to the Arabic forms, particularly the broken plurals; these when discussed in separate paragraphs are quite formidable enough to frighten most beginners, but when the principle of their formation is explained, and the whole are presented in a tabulated form, they are as simple as the paradigm of an ordinary verb. In a work of the kind it was scarcely possible to avoid misprints, and we have reason for knowing that most of those which are not already corrected in the table of *errata* have been detected with a view to correction in a second edition. But there are a few errors of orthography for which the author himself is responsible, which should also be rectified; thus *منکار* *minkār* for *منکار* *minkār* with the error perpetuated in the transliteration is a bad mistake; but much worse is the retention of the absurd letter *ل* to represent the Arabic *alif makhṣūrah*. This letter was invented by those who designed the old fashion types first used in India. But it is founded upon an entire misconception, the upright *alif* belonging not to the *yā* but to the previous letter of the word.

A very considerable saving of time and space might have been attained had the author given more attention to the principles of euphonic change and less to the detailed account of forms. Following the example of older grammarians, European as well as Oriental, he gives long lists of irregular forms (as the causal verbs, p. 161); whereas, if the leading euphonic principles which modify the pronunciation of certain words were satisfactorily explained, there would be no need to set down such a thing as an irregular verb as existing.

Much remains yet to be done for Urdū grammar in spite of the present voluminous treatise; but Mr. Platts may at least lay claim to being the first who has attempted a really scientific account of the principles of the structure of the language. Such being the case, we could scarcely hope to find the material very carefully arranged; and, indeed, the worst fault of the book is a little want of method and symmetry, especially in the tabulation of forms and the arrangement of syntactic rules. For all that, I have no hesitation in saying that Mr. Platt's *Grammar of the Hindūstānī or Urdū Lan-*

language is the best that has hitherto appeared, and as such I would cordially recommend it both to beginners and more advanced students.
E. H. PALMER.

SCIENCE NOTES.

METEOROLOGY.

Weather Study in the United States.—The veteran Professor Loomis—whose paper, published in 1859, "On certain Storms in Europe and America," was one of the most suggestive of the early memoirs which laid the foundation of what is well called modern meteorology—has submitted the Signal Service weather maps for 1872-73 to a careful discussion, and has published the results in a condensed form in *Silliman's Journal* for July, 1874, and January, 1875. He picked out all the instances in which a clearly-defined area of either low or high pressure was traceable within the region covered by the telegraphic system, and studied them on a uniform plan.

As regards the former class, the storm areas, he finds their mean direction of motion in the twenty-four hours to be N. 82° E. and the mean velocity 25.6 miles per hour; but this average result gives but little idea of the true motion of the storm from day to day, as the centres take every possible direction, and the hourly rate of progress varies from fifteen miles to the westward to sixty miles to the eastward.

Professor Loomis is of opinion that the direction of advance of the storm is regulated by the position of the rain-area which surrounds it, and which is, on the whole, asymmetrically disposed around it, spreading out most on the eastern side.

The mean velocity of the wind is greatest (ten miles per hour) in the western quadrant, and decreases gradually through the southern and eastern to a minimum (of 7.6 miles per hour) in the northern.

The stronger the wind in the west quadrant the less is the speed of the storm's progress, and, conversely, an increase in the velocity of the wind in the east quadrant accelerates the advance of the storm. The rate of advance is also shown to bear a sort of proportion to the rate of rise of the barometer in the rear of the storm; in fact, Professor Loomis thinks that, being given a weather map showing the position of a storm centre for a certain hour, it seems possible to predict where the centre will be at the end of twenty-four hours; but he admits that numerous and striking exceptions are found when we attempt to apply these rules to particular cases.

The second paper refers to areas of high barometer, and as to the direction of the wind it is shown that this is nearly directly opposite in each quadrant to what prevails in the case of areas of low pressure, and in both cases is almost exactly midway between a tangential and a radial movement. Inasmuch as in the instances of a high barometer the drain of air flowing out must be supplied from above, it is evident that the intense cold prevailing in anticyclones is due to the descent of air from the upper strata of the atmosphere, and this is abundantly shown by the instances cited in the paper.

In conclusion the Professor seeks to establish a relation between the velocity of the wind and the distance between the isobars, but finds the discrepancies between the results very great. This he truly attributes to the difficulty of ascertaining the correct velocity of the wind on land.

The whole investigation, though it does not lead to any very decided conclusions, shows us what advantages the American meteorologists enjoy over the European in their facilities for studying weather over an extended land area, as compared with the sea-indented western coasts of the Old continent.

Atmospheric Circulation.—It has long been a matter of regret that the fact of the publications of the Royal Meteorological Institute of Holland

being in Dutch, has rendered them less useful to the general public than they deserved. M. Estourgies therefore has done good service to the science by publishing a French translation of Buys Ballot's paper "On the Currents of the Sea and the Atmosphere," which was issued in 1855, but whose contents, although well worth attention, have been hitherto almost unknown to meteorologists out of Holland.

THE Geographical Society of Paris has recently issued a small pamphlet of 17 pp., *Programme d'Instructions aux Navigateurs pour l'Etude de la Géographie Physique de la Mer*, which has been drawn up by a committee of five of its members. It is impossible, as the manual embraces such a wide scope of enquiry, that in such brief compass it should give more than scanty notes, and the portion relating to meteorology only occupies a page and a half.

Additional Meteorological Returns for the United Kingdom.—We learn from the address of the President of the Meteorological Society, read at their anniversary meeting on the 20th ult., that arrangements have been concluded between that Society and the Meteorological Office, in virtue of which the Society will, in return for an annual allowance, furnish returns from certain stations recently organized by it, to be published by the Office, in combination with certain returns received by the latter directly, as supplementary to the results already printed for its seven observatories. It is of importance to see that some of these supplementary stations are in Ireland, from which country the meteorological information hitherto published has been of the most scanty description.

Effect of Rainfall on the Barometer.—In the first number of the Austrian Journal for Meteorology for this year, Captain Hoffmeyer criticizes Hann's reasoning on this subject, which was noticed in the ACADEMY for January 2. He points out that while he fully accepts the conclusion that a heavy rainfall can only be due to an ascending current of air, he disputes the assertion that the barometer rises as the rain falls, inasmuch as the heaviest, or, at least, the most persistent rain occurs in the front of an advancing cyclone, where naturally the barometer is falling. Dr. Hann, in the same number, rejoins that, without disputing the accuracy of the facts cited by Hoffmeyer, the reasoning does not render untenable the position which he himself has taken up—that the rainfall is not the cause of the fall of the barometer. He shows that the distribution of rain in the wind-rose bears no relation to that of barometrical pressure, the maximum fall and the minimum pressure falling on different points of the wind.

Aqueous Vapour in the Atmosphere.—In the number of the Austrian Journal for Meteorology for January 16, Dr. Hildebrandsson, of Upsala, gives an account of some experiments conducted by himself and Professor Rosén, which have hitherto only been noticed in the Swedish journals. We have only space to give his conclusions, which are as follows:—

1. The permanent gases in the atmosphere do not form independent atmospheres, but have effected a complete mutual interpenetration, as all experiments show that the constitution of the air is the same at all heights.

2. The incessant evaporation and condensation which are in progress render impossible the existence of an independent vapour atmosphere, or of a homogeneous mixture of the vapour with the permanent gases, and must cause the vapour to diminish rapidly with height.

3. It is not allowable to subtract the vapour-pressure from the barometer reading to obtain the pressure of dry air.

For the experiments and reasoning by which these conclusions, already held by many physicists, have been attained, we must refer to the paper, which is followed by some interesting observations by Dr. Hann on Dalton's law, and the theoretical

possibility of certain deductions from it as to the presence, e.g., of hydrogen in considerable quantity in the upper strata of the atmosphere.

GEOLOGY.

It is rumoured that the Geological Society's Wollaston medal will this year be presented to Professor de Koninck, of Liège; and that the Murchison medal will probably be awarded to Mr. W. Jory Henwood, of Penzance.

DURING the past month the Geological Society has issued a thick supplementary number of its *Quarterly Journal*, containing no fewer than seventeen original papers. The necessity for publishing this special part, and the high character of many of the papers which it contains, are sufficient proof of the healthy activity of this Society. In the opening paper Mr. Allport, of Birmingham, gives the result of his researches "On the Microscopic Structure and Composition of British Carboniferous Dolerites." Having prepared and studied a collection of 230 sections of these rocks, he is able to assert that it is impossible to establish any mineralogical or structural difference between the augitic eruptive rocks of Palaeozoic age and those of Tertiary date. It has hitherto been the fashion among petrologists in naming a given rock to allow some weight to its geological position: while, for example, a certain volcanic rock of Tertiary age is called basalt, a similar rock of Palaeozoic age is termed melaphyre. Mr. Allport argues with much justice that the mineralogical constitution of eruptive rocks, and not their geological position, should rule their nomenclature. He protests, too, against the practice of naming a rock according to its texture, since one and the same rock may exhibit great structural variations in different parts of its mass; thus, petrologists are in the habit of applying to a certain rock the various names of basalt, anamesite or dolerite, according as its texture is compact, fine-grained, or coarsely-crystalline, although it is possible to collect samples of all these varieties in a single quarry. On these and other grounds Mr. Allport proposes to discontinue the use of the terms *melaphyre*, *aphanite*, *anamesite*, *diabase*, and *greenstone*; and to group together all these basic eruptive rocks under the generic name of *dolerite*—a name which has suffered, perhaps, less abuse than most of those terms which it is intended to supplant.

Among the other papers in this number of the Geological Society's *Journal*, we may especially refer to Mr. G. W. Stow's "Geological Notes on Griqualand West." The observations recorded in these notes were made in 1872, during an official tour of inspection of the new territory. Much of the interest of this paper lies in the fact that it tends to throw light upon the geological structure of the great area of Olive Shales, which form so marked a feature in the South African diamond-fields. The rock-specimens collected during the tour have been described by Professor Rupert Jones.

SOME "Geological Notes" on the Noursoak Peninsula, Disco Island, and the country in the vicinity of Disco Bay, North Greenland, have been laid before the Geological Society of Glasgow by Dr. Robert Brown, of Campsie, and are printed in a recent number of the Society's *Transactions*. These valuable notes record the results of a voyage specially undertaken to explore the Miocene beds of the Waigat Strait, but as this expedition was undertaken as far back as 1867, it is curious that the notes have not been published earlier. It appears that it was mainly upon specimens collected by Dr. Brown during this exploration that Professor Heer founded his conclusions on the Arctic Miocene flora enunciated in his memoir in the *Philosophical Transactions* of 1869. As a consequence of the delay in publishing Dr. Brown's Report, we find that much of his matter has been anticipated by the researches of subsequent explorers, and it is therefore unnecessary to analyse the present com-

munication. It may, however, be remarked that Professor Heer's conclusions are criticised, and it is in fact hinted that some of his specific determinations were based upon what the writer believes to be very insufficient data; the sole guide in establishing a new species being in many cases a solitary leaf.

An illustrated lecture on "The Geology of the Clyde Valley," by Professor John Young, of Glasgow, has recently been published. This lecture was delivered last November at the opening of a ladies' class, which, since 1868, has met annually under some of the Professors of the Glasgow University. The present lecture, which gives a masterly sketch of the geological structure of the country around Glasgow, was introductory to a course on the general Principles of Geology.

It is generally supposed that the pterodactyls, or flying reptiles, must have possessed an integumentary expansion supported by the ulnar digits of the anterior extremities, and more or less resembling the patagium of a bat. Dr. T. C. Winkler, of the Teyler Museum at Haarlem, believes that he has found traces of the former presence of such a membrane in a specimen of *Pterodactylus Kochi* (Wagn.) recently acquired by this institution. The skeleton of this pterodactyl lies on a slab of fine-grained lithographic limestone from Bavaria. The stone is tinted brown by means of hydrous peroxide of iron, and it is notable that, where this colouring-matter has met with any obstacle, its diffusion has been prevented, and it has consequently accumulated locally, thus giving a more pronounced tint to certain parts of the stone than to others. In this way the several bones are surrounded by a brown margin, while between the bones of the anterior limbs are a number of brown bands, which, Dr. Winkler suggests, may have been caused by a plicated membrane having arrested the diffused colouring-oxide, and thus determined its local deposition. It may be remarked that the Teyler Museum is fortunate in also possessing the celebrated specimen of *Pterodactylus crassipes*, described by Hermann von Meyer, which is said to be the only known example of a pterodactyl showing anything approaching to the structure of an integumentary expansion. Dr. Winkler's memoir on the new specimen has appeared in the *Archives du Musée Teyler*.

In the February number of the *Annals and Magazine of Natural History*, Professor Nicholson describes and figures a small group of Lower Silurian fossils from Ohio, including two new species of *Alecto*, described as *A. auloporoides* and *A. confusa*. The same naturalist has contributed to a recent number of the *Geological Magazine* descriptions of several new species and one new genus of Polyzoa from the Palaeozoic rocks of North America. The new genus, which has received the name of *Heterodictya*, closely resembles the genus *Ptilodictya*, from which it differs in the very anomalous feature that its cells are regularly tabulate, a feature of interest, since it serves to establish a connecting link between the Polyzoa and the Tabulate Corals. *Heterodictya* is at present represented by only a single species, *H. gigantea*, from the Carboniferous Limestone of Ontario.

The last part of the *Nouveaux Mémoires* of the Imperial Society of Naturalists of Moscow is devoted to two geological memoirs by Professor H. Trautschold, of Moscow. One of these is a critical examination of the fossil-fish from the Upper Devonian rocks of Malowka, in the government of Toula. The second memoir describes the quarries of carboniferous limestone at Mjatschkotowa, near Moscow.

To the last number of the *Bulletin* of the same society, Herr H. Abich contributes some interesting "Geologische Beobachtungen auf Reisen im Kaukasus im Jahre 1873." The first journey, commenced in May of that year, was directed to localities on the south side of the Kaukasus, and

the second excursion, undertaken in the following July, extended to the northern side. The author has visited and described the mineral-springs of these mountains, and has specially studied the Jurassic rocks of the north. The Lower Oolitic coal-bearing sandstones may be paralleled with similar beds in Yorkshire.

The Ecstatic Louise Lateau.—We find in the *Revue Scientifique*, January 23, 1875, a report of Professor Virchow's address to the Association of German Naturalists and Physicians, assembled at Breslau, on the subject of miracles, with special reference to the case of Louise Lateau, the Belgian girl, whose ecstasies and exhibitions of the stigmata have excited much attention for several years. In 1870 M. Hartsen, a Dutch physician, sent to Professor Virchow a publication by M. Lefebvre, entitled *Louise Lateau, sa Vie, ses Extases, ses Stigmates*, which greatly astonished him; but he took no notice of the matter until Professor Rohling, of the Academy of Münster, thought proper to issue a pamphlet entitled, *Louise Lateau, la Stigmatisée de Bois d'Haine, d'après des Documents Médicaux et Théologiques authentiques, à l'usage des Juifs et des Chrétiens de toutes les Confessions*. This pamphlet has gone through nine editions, and it is said that 50,000 copies have been distributed among the public. It treats the appearances as miracles that confirm the Roman Catholic faith, and affirms that all Protestants who read it may see "that God the Father calls upon them to re-enter the bosom of the Church." The like invitation is addressed to Jews.

Professor Virchow was invited to go and see Louise Lateau, which he refused to do, but offered to examine her case thoroughly if she was removed from her home and placed under his care. He said that his long experience in attending prisoners who feigned all sorts of disorders had acquainted him with the difficulties of discovering their frauds and convinced him how useless it was to make such an endeavour when all the conditions were regulated by other persons.

He pronounced the whole affair "a very gross imposture," for which he gave many reasons. According to M.M. Rohling and Lefebvre, on Friday, rarely on Thursday, a blister (*ampoule*) began to form on the girl's hands and feet, raising the skin. During the night of Friday this blister is completely developed, two and a half centimètres long, and one and a half wide; the adjacent skin is neither swollen nor reddened; the blister then splits and pours out its fluid clear and transparent; at the same time blood flows from the skin, without the best magnifying glasses permitting any lesion of the epidermis to be seen. The epidermis opens by a longitudinal slit, sometimes cruciform, sometimes triangular. Had the matter stopped here, he might, he said, have thought it worth while to undertake a journey to the spot; but "hardened by success, the miracle assumed such a development and such an aspect as to render such a step quite useless." Louise had fits of great excitement, and then passed into states of complete insensibility, even to powerful electric shocks, though some doubted it. In this condition she had visions, and only kept up communication with the outer world through a special ecclesiastical influence. Since the day of the Seven Sorrows of Mary, March 30, 1871, she is reported to have taken no food except one consecrated wafer (*hostie*) a day, and a few spoonfuls of water a week, and this abstinence of more than three years has not prevented her from enjoying good health.

The authority of M. Schwann having been cited in confirmation of these allegations, Professor Virchow called upon him for explanations, which he gave, as we shall see presently. When Louise is in the state of insensibility to electric shocks, "she is very sensitive to the influence of superior ecclesiastics, but only to those regularly constituted, that is to say, the curé, the bishop

his immediate chief, and the archbishop. The alone can excite the miracle. All other bishop and strange priests are powerless, but her own bishop, of Tournay, can temporarily transmit his power to another person, and permit him to exercise it. One day, M.M. Lefebvre, Schwann, and the bishop went together to Bois d'Haine. The bishop transferred his power to Schwann, who called to the girl, who was lying on the ground "Do you hear me?" upon which she raised her head to listen. He then ordered her to get up which she did. The bishop in his turn commanded her to sit down, which she immediately obeyed."

Dr. Schwann's reply to Professor Virchow dated Liège, September 25, 1874, states that "his name has been abused, and that the words attributed to him are entirely false," as Dr. Rohlin admitted in the fifth edition of his pamphlet. He adds that "the conditions indispensable to scientific examination of the phenomena at Bois d'Haine were in nowise fulfilled," and that he only "assisted as a spectator on the express condition of preserving his incognito." Dr. Rohling threw the blame of this misrepresentation on M. van Looy, from whose pamphlet, he says, he borrowed it. The Professor adds "that it remains to be proved that Louise Lateau is not a cheat; and that her examiners are honest men and friends of truth. Alluding to the ecclesiastics and their abettors, he exclaims "and it was in such society that I was to undertake the investigation!"

M. DE VOÛË, French Ambassador at Constantinople, has recently made a communication to the Académie des Inscriptions et Belles Lettres, in which he is himself a member, on a Phœnician inscription found at Byblos, the biblical Gebel. It contains fifteen lines, the sixth and the seventh of which are much damaged on the right-hand side and many letters in other parts of the inscription are scarcely to be recognised. We are informed by M. J. Dérenbourg that the bas-relief represents the goddess Bealtis, in the shape and with the emblems of the Egyptian Isis, the King Yehmelek in a Persian costume facing her, and offering her a cup which he holds in his hand. Since we know that the Kings of Gebel are represented in Greek costume on other bas-reliefs we may date the present inscription from the Persian time. As far as we are informed, the inscription does not contain historical facts, but important contributions to Phœnician grammar and lexicography, which we shall enumerate partly according to the kind communication of Dérenbourg. 1. The pronoun 𐤀 and 𐤁 in the inscription, such being a composition of the Hebrew אני and the Aramaic אנא and אנכי and אנכי . 2. The 𐤁 occurring for the first time in Phœnician inscriptions as the possessive pronoun of the third person. 3. חיה , "to live," for חיה , which we find in the name of Hava (Eve), probably in the *avo* in the *Poenulus* of Plautus. The root חיה , in the sense of carving, and בן with the meaning of "grandson."

We are delighted to see the first Sanskrit printed at Leyden. It is the manual of Astron. ascribed to Āryabhaṭa, with the comment Bhaṭadipikā by Paramādiśvara (Trübner & Co.). The date of Āryabhaṭa, or rather of his manuscript is 499 A.D. The book is edited by Dr. Kern, of the best living Sanskrit scholars, well-known by his excellent edition and translation of Vāhamihira's *Bṛīhatsaṃhitā*. The MS. materials were scanty: two Malayālim MSS. of text and commentary, one belonging to Dr. Burnell, the other to the Royal Asiatic Society, London; another MS. of the text only, No. 60 of the W. collection, likewise in the library of the Royal Asiatic Society. There is another comment on the Bhaṭaparakāśa, by Sūryadeva. Copies exist in the Mackenzie and in Dr. Burnell's collections. Two MSS. in the library of Trinity College, Cambridge, contain an abstract of Sūryadeva's work, but these MSS. are so corrupt, and specimens given in the Catalogue so full of

hat Dr. Kern's extracts, taken from a IS., will be read with great interest by all scholars. We are sorry that Dr. Kern not have given a translation of both the commentary. There is no scholar better for such a work, and it would have given little trouble. On page vii. Dr. Kern sign of exclamation after *sikshā*, the docu- metres, instead of *sikshā*. The spelling out, strange in a modern author, but it is spelling of the word. (See Max Müller's of *Ancient Sanskrit Literature*, 2nd ed.,

ESSOR HILGENFELD, of Jena, has just pub- large volume of 828 pages, which will be indispensable by all critical students of y. It is an *Historico-Critical Introduction New Testament*, and is published by Fues zig. Fulness of information, originality ment, and conscientiousness in registering ses of critical opinion, seem to place this the head of all extant introductions to igher criticism" of the New Testament. cellently arranged; Part I. containing "The und its Criticism," Part II. "(Introduction Separate Books," Part III. "The History New Testament Text." It is nothing less ry, but presupposes, of course, an accept- a method of Biblical criticism which has greater progress in Germany than in 3.

Jahrbücher published by the members of ological faculty at Jena have opened their n a way which justifies the best hopes of ceess. They are not intended in the inte- sect or party, but of free enquiry. And jects discussed are of the most modern tion. No less than four articles are devoted ew question of the origin of religion, and ly the Hebrew religion, regarded from sides. Thus Holtzmann opens the number ribing the lines in which modern theology ve to move, or rather is beginning to move. e abandon its isolated position, and investi- mentary questions, like the origin of reli- an historical spirit. High praise is awarded recht Ritschl's great work on the Doctrine ification, as throwing much light on this . A few pages are also devoted to Hart- he philosopher and Strauss. Nietzsche est- the historical significance of the *Aufklä- eologie*, the form presented by rationalism second half of the last century—an inte- essay, which is well supplemented by 'conscientious and thorough examination iermacher's famous *Reden über die Reli- eiferer* discusses the subject only touched e opening essay, viz., the beginning and ment of religion. It is chiefly taken up criticism of the theory of Fritz Schultze, ligion originates in fetishism. Schrader popular summary of the remarkable paral- tween the Israelitish and Mesopotamian 1 and civilization. His researches have led believe that the outward form of paral- e notion of Sheol or Hades, the deep sense which have been thought peculiar to Hebrew are really of Babylonian, or more precisely an—and therefore non-Semitic—origin. 1 and French students are already familiar he leading results of this essay, and we help desiderating some acknowledgment of rity of foreign scholars (e.g., on the rela- Accadian to Hebrew, and, among minor the discovery of the god Rimmon, or rather an). A short paper on Luke v. 1-11, by 3, concludes the number.

he Meeting of the Anthropological Institute sday next, a paper by the Rev. Wentworth er will be read, entitled "An Examination per by Mr. Boyd Dawkins, F.R.S., on 'The m Range of the Basques,' in the *Fortnightly* for September, 1874."

MEETINGS OF SOCIETIES.

ROYAL GEOGRAPHICAL SOCIETY (Monday, Jan. 25).

SIR HENRY RAWLINSON, the President, announced that Messrs. Watson and Chippendale, two young Engineer officers who left London last summer to join Colonel Gordon's expedition in Central Africa, had arrived at Gondokoro on November 14, and purposed to proceed to explore the Albert Nyanza lake towards the end of that month, a small steamer for the purpose having been previously conveyed to Dufilé, a station above the falls which obstructed navigation between Gondokoro and the lake. The duties of these two officers would be exclusively exploration and survey, and to that end they had been furnished with instruments by the society. M. Linant, another member of the expedition, was under orders to proceed to the Somerset Nile of Speke and Victoria Nyanza. The Khedive had given permission for the geo- graphical results of the mission to be commu- nicated to the Society, and early intelligence might be looked for.

A paper was then read by the Rev. J. Mullens, D.D., of the London Missionary Society, on the Central Provinces of Madagascar. The island, according to Dr. Mullens, is 818 geographical miles long, and 354 broad in its widest part. The central mountain mass commenced with lofty hills at its northern end, and retained them till not far from the southern cape. In the higher parts the chief formation was gneiss or granite. The central province had been the scene of volca- nic eruptions on an enormous scale. To the south- west of the capital lay the Ankarat Mountains, covering a space of 600 square miles. The chief inhabitants are the Malagasy people, a single race, divided into three principal tribes; as a rule, they are backward, but peaceful, hospitable and in- dustrious. The prince was their chief and the owner and lord of all. All obligations were paid by feudal service, and remunerations were made by assignment of lands and of service of inferior men. The queen was an excellent Christian lady, and possessed a warm affection for her people. Many thousands had proved by their example that they were not only intelligent but sincere. Sir Bartle Frere spoke of the beautiful climate of the island and the interest attaching to the flora and fauna. The missionaries, he could bear witness, were exercising a beneficial effect on the islanders, who were fast becoming a civilised people. Sir Henry Rawlinson then announced that the sub- ject of the next meeting would be a paper by Admiral Sherard Osborn, on the approaching Arctic expedition.

ANTHROPOLOGICAL INSTITUTE (Tuesday, Jan. 26).

ANNIVERSARY MEETING: Professor Busk, F.R.S., President, in the Chair. The Report of Council stated that owing to the liberality of its members the Institute had been placed in a sound financial position, its burden of debt having been removed, and that it commenced a new year with great hope and prospect of success in increasing its number of members, and in the accomplishment of a much larger amount of scientific work, resulting in the publication of its Journal more frequently and regularly, as well as other works on Anthropology.

The President, in his address, reviewed the works of the past year in Anthropology, English and Foreign, offering criticisms on the most im- portant, especially the memoirs of Professor Owen, and Professor Lauth, on Egyptian Ethnology; Dr. A. B. Meyer on the Papuans; on Memoirs by M^{me}. Royer, M. Arcelin, M. Mortillet, M. Broca, Dr. V. Holder, and others. At the close of the address a vote of thanks was given to Professor Busk, on retiring from the Presidential Chair, which he had filled with the greatest advantage, financially and scientifically, to the Institute. The following were elected to serve for 1875:—President: Colonel A. Lane Fox,

F.S.A. Vice-Presidents: Professor Geo. Busk, F.R.S.; John Evans, Esq., F.R.S.; A. W. Franks, Esq., M.A., F.R.S.; Francis Galton, Esq., F.R.S.; Geo. Harris, Esq., F.S.A.; Sir John Lubbock, Bart., F.R.S. Directors: E. W. Brabrook, Esq., F.S.A.; F. W. Rudler, Esq., F.G.S. Treasurer: Rev. Dunbar I. Heath, M.A. Council: J. Beddoe, Esq., M.D., F.R.S.; W. Blackmore, Esq.; H. G. Bohn, Esq., F.R.G.S.; Hyde Clarke, Esq.; J. Barnard Davis, Esq., M.D., F.R.S.; W. Boyd Dawkins, Esq., F.R.S.; Robert Dunn, Esq., F.R.C.S.; David Forbes, Esq., F.R.S.; Sir Duncan Gibb, Bart., M.D.; Charles Harrison, Esq., F.R.S.L.; J. Park Harrison, Esq., M.A.; Professor T. McK. Hughes, F.G.S.; T. J. Hutchinson, Esq., F.R.G.S.; Professor Huxley, F.R.S.; F. G. H. Price, Esq., F.R.G.S.; J. E. Price, Esq., F.S.A.; C. R. Des Ruffières, Esq., F.R.S.L.; Lord Arthur Russell, M.P.; Right Hon. D. H. Stone; E. Burnet Tylor, Esq., F.R.S.

GEOLOGICAL SOCIETY (Wednesday, January 27).

J. EVANS, Esq., F.R.S., President, in the Chair. A paper "On the Structure and Age of Arthur's Seat, Edinburgh" was read by Mr. J. W. Judd. It is generally supposed that the volcanic series of Arthur's Seat may be referred to two distinct geological periods; the earlier eruptions must certainly have been of Lower Carboniferous date, but the later period of activity has been variously re- garded as Tertiary, Secondary, and Permian. The hypothesis of two distinct epochs of eruption, originally suggested, but subsequently abandoned, by Charles Maclaren, has been since advocated by Professor Geikie and other Scotch geologists. Mr. Judd pointed out the great difficulties which this view presented; such as the extreme improbability volcanic action breaking out on precisely the same of site at widely-separated geological periods. He then suggested an explanation, which involved far less difficulty, inasmuch as it referred the whole of this volcanic series to one general period of ac- tivity. It would appear that in the middle of the Calciferous-Sandstone series a vast accumulation of trachytic and doleritic lavas was poured forth from a submarine volcano, which was gradually elevated so that the eruptions ultimately became subaerial; the volcano after its extinction being again submerged.—Mr. J. Clifton Ward read his second paper on "The Glaciation of the Southern part of the Lake District, and the Glacial Origin of the Lake Basins of Cumberland and Westmoreland." Having extended the ob- servations recorded in his previous communi- cation, he was enabled to show the probability of some of the larger Cumbrian lake-basins having been formed by the agency of moving ice. By means of sections drawn to a true scale he showed the comparative depths of the lakes, and the thickness of ice which must at one time have travelled over their sites, as testified by the heights to which glacial markings extend up the sides of the surrounding hills.

ROYAL SOCIETY OF LITERATURE (Wednesday, January 27).

MAJOR-GENERAL SIR COLLINGWOOD DICKSON, K.C.B., V.C., V.P., in the Chair. Mr. Percy Gardner read a paper "On a Greek Inscription found by Mr. Calvert in 1874 at Hissarlik (Ilium Novum)." In this paper Mr. Gardner gave a transcript and a translation of this decree of the people of Ilium in favour of Malusius of Gargara, confirming to him the grant of a crown of gold worth 1,000 drachmas, in return for the good deeds he had done for that city, for the temple of Athens, at Ilium, for the festivals held there, and for the league of cities; and, especially in that he had lent free of interest 300 gold staters towards the equipment of an embassy to Antigonus (King of Asia), with a further addition of 450 similar coins. The decree in addition granted to him and his descendants complete immunity from taxation, with the order that it should be engraved

on a pillar and set up in the temple of Athene, to the end that all men might know that the allied cities were ready to reward their benefactors. It is further stated that this pillar and inscription were to be kept in repair by the people of Gargara, while towards the end of it there is also the statement that, beside his other benefactions, Malusius had given 3,500 gold staters to the Agonotheatae, beside paying the debts they had incurred in a former year.

The forms of the letters suggest the latter end of the fourth century B.C. as the date of this inscription, and from internal evidence we may presume it was engraved between B.C. 301 and 311. The larger donation of 3,500 staters must have represented a sum equal to 20,000*l.* of our present money.

ROYAL SOCIETY (Thursday, January 28).

THE following papers were read: "On the Theory of Ventilation," by Dr. François de Chaumont; "On the Atmospheric Lines of the Solar Spectrum," by J. B. N. Hennessey.

SOCIETY OF ANTIQUARIES (Thursday, January 28).

A PAPER was read by Morgan Nichols, Esq., on "The Recent Discoveries elucidating the Topography of Rome, especially of the Forum Romanum." Mr. Nichols exhibited a map showing the portions of the city which have been excavated down to the original level, and the lines of the *via sacra* and other principal roads, with the sites of the buildings whose bases have been brought to view. It has been found that the *via sacra* or *via sub veteribus* (sc. *tabernis*) after traversing the forum does not proceed in a straight line to the temple of Vesta, but turns off at a right-angle northwards for a short distance, and then resumes its original direction past the temple of Faustina and on to the basilica of Constantine. The angle thus made was doubtless cut off by a foot-path leading past Vesta's temple, as mentioned by Martial in a passage quoted by Mr. Nichols. Of the temple of Vesta all that now remains is the raised base, a circular mass about fifty feet in diameter, and near it is a bank of earth, which is probably the site of the *Virginea domus*, "Where dwelt the holy maidens who fed the eternal flame."

Near this stood the temple of Castor, and in the same neighbourhood the temple of Julius, of which the brick base of about twenty-two feet in height has been laid bare by the excavations. The front of this base was used as *rostra*, and was ornamented by Augustus with beaks of the galleys taken at the battle of Actium. In addition to the maps, Mr. Nichols exhibited many photographs of buildings and other remains at Rome, and among them representations of two bas-reliefs which were discovered in September, 1872, in the northern part of the Forum. These are two slabs of white marble, about seventeen feet by five feet six inches, placed so as to form an approach, probably to an altar. On the inside face of each slab are sculptured a ram, a bull, and a boar, decked with sacrificial bands and *vittae*, their heads pointing towards the spot where the altar probably stood. The outside faces bear sculptured groups representing acts in the life of the emperor in whose honour the altar was erected. On one is a figure of the emperor seated on a throne, surrounded by attendants, receiving with outstretched hands a female figure holding a child on one arm and perhaps leading another, to judge by the attitude; but the sculpture is at that part too much injured to allow of more than conjecture. It is supposed that this group commemorates the provision made by the Emperor Trajan for the children of poor citizens. On the other side is a group of men bearing large portfolios, and depositing them in a heap, to which another person is stretching out his hands, probably with a torch. This, it is presumed, represents the burning of the registers of taxes remitted by the Emperor. It is known that this ceremony was performed by order of Ha-

drian on such an occasion in the forum of Trajan, but the sculpture cannot refer to this, as the buildings represented in the background do not in any way tally with the spot where this act is said to have been performed. It is known that Trajan also remitted certain unpopular imposts, and it is conjectured that his clemency may be here commemorated. The objects in the background are the sacred fig-tree, the statue of Marsyas, the rostra and other buildings in the Forum Romanum. The tree represented is not the *ficus Ruminalis*, but another mentioned by Pliny as standing in the forum near the Gulf of Curtius. These various objects are placed in different positions in the two bas-reliefs, not accidentally, but as representing two different views of the forum; and Mr. Nichols thinks that the sculptures will be found of great use in determining the relative positions of the buildings which they represent.

ROYAL INSTITUTION (Friday, January 29).

A LECTURE on "The Geological Results of the Challenger Expedition" was delivered by Professor Huxley, LL.D., F.R.S. Tracing back our knowledge of the character and distribution of deep-sea deposits to the early observations of Sir John Ross, Sir E. Sabine, and other explorers, the lecturer remarked that these observations had proved that large areas of the sea-bottom within the Arctic seas were covered with the siliceous remains of minute plants and animals belonging to the *Diatomaceae* and *Radiolaria*. Subsequently the exploration of the Antarctic seas showed that a similar polar cap of siliceous mud covered the sea-bottom of this southern area. It has since been abundantly proved that, between these two zones of siliceous deposits, large portions of the bottom of the Atlantic and Pacific Oceans are covered with a calcareous ooze, made up in great measure of the tests of foraminifers, especially those of the *Globigerina*. But the dredgings of the *Challenger* have recently shown that certain deep oceanic valleys contain thick deposits of finely-divided red clay, composed of silicate of alumina and peroxide of iron. Thus, between Tenerife and St. Thomas, a great valley was found at a depth of about 18,000 feet, the bottom of which was covered with this red material. The origin of such deposits is probably to be found in some experiments by Mr. Buchanan, the chemist to the *Challenger*, who, by treating the globigerina-marl with dilute acids obtained about one or two per cent. of insoluble residuum, which strikingly resembled the clay in question. Hence the conclusion appears to be forced upon us that the great deep-seated deposits of red clay actually represent the remains of marine organisms, of which myriads must have suffered decomposition to furnish these vast accumulations of their *débris*. We are now, therefore, in a position to show that siliceous, calcareous, and argillaceous deposits may be formed by the long-continued action of organic agencies. Nor should it be forgotten that internal casts of foraminifers in glauconite have been dredged up similar to those which Ehrenberg originally described as occurring in certain beds of greensand. It is thus clear that sedimentary rocks of almost any mineralogical composition may be formed by the action of natural causes still in silent operation in the depths of the sea. These researches consequently lend great support to the views of those geologists who find an explanation of the past history of the rocks in the present operations of nature—views which were held half a century ago by Sir Henry De la Beche, were advocated by Mr. Poulett Scrope, and were still more clearly developed by Sir Charles Lyell, who has so ably elaborated the doctrine of uniformitarianism originally enunciated by Hutton. Sir Charles has, indeed, survived the prejudices which at first opposed his views, and has lived to see the reputed heresies of his youth become established as the creed of every philosophical geologist.

FINE ART.

THE DUDLEY GALLERY.

(First Notice.)

THIS collection of Water-colours, the eleventh of the series, which opened to public view on February 1, is chiefly a landscape-gallery. In general aspect it is skilful, but also ordinary. As one goes through it, however, the number of clever or attractive pieces is found to be considerable, and the landscapes are not scantily interspersed with figure-subjects. This ranks as at any rate a nice average exhibition in its sequence.

Professor Poynter's small figure-picture may, on the whole, count as the leading work of that class in the room. It bears the motto—

"In time long past, when, in Diana's chase,
A bramble-bush pricked Venus in the foot,
Old Aesculapius helped her heavy case
Before the hurt had taken any root."

The composition presents Aesculapius seated under a portico; Venus standing on her right foot, and bending forward her left across the right knee, to exhibit the injured part, and propping herself with her left hand (which along with the arm is a weak point in the drawing) upon one of the three attendant Graces; the second Grace stands close by the first; the third, whose back only is seen, calls to a female slave for water from a dripping fountain close by. This little work is a careful and complete piece of execution, good in form, and, if not precisely poetical in spirit, still free from anything discordantly prosaic. It is a choice specimen from a choice hand. Three of the painter's carefully-observed landscape-bits are also in this gallery. The *Farm near Hartlebury Common* and *Wilden Pool* are pleasant local studies. *Hardrow Scar* may be somewhat less satisfactory, having an ordinary general look, and (as well as the *Wilden Pool*) too lightless a sky: the water flung straight downwards over the rock, into successive almost founce-like undulations, is however a valuable item of reality. Along with Professor Poynter we may name, as painters of classical subjects, Mr. Crane and Mr. Henry Holiday. Mr. Crane sends two pictures. The first is named *Pluto's Garden*; and shows Proserpine, in the Elysian fields, plucking the pomegranate, by eating which she forfeited her chance of ever returning to earth. "Aesculaphus was the only one who saw it; and, for his discovery, the goddess immediately changed him into an owl." There is always a great difficulty in representing pictorially any transformation of this sort. Mr. Crane adopts the expedient of showing us Aesculaphus as a bald-headed red-robed man, gazing at Proserpine; and then, on a marble seat hard by, he gives sculptured figures of two owls, and besides a real living owl perching. This is one way of suggesting to the eye what the mind needs to realise, in case the incident is to be treated at all: it is not quite a reasonable way, if (as would seem) we are to infer the Aesculaphus was the first owl created, and parent of all owls. The garden of Pluto presents clipped old-fashioned hedges, an arcaded palace behind with baleful-looking fires beyond it, and a multitude of marigolds and sunflowers; this floral material being perhaps the most telling element in the picture. The face of Proserpine is inexpensive, but is of a large Grecian type, in itself appropriate enough. The like may be said concerning the recumbent figure of Mother Earth in Mr. Crane's second contribution, named *The Earth as Spring*. The sonnet given in the catalogue marks well the character of the work:—

"Child Spring, escaped from harsh Dame Winter's rod,
Upon the still green meads stole forth to play,
Glad in the sun's first smile that early day,—
Fresh daffodils declaring where he trod
Full softly; while upon the tender sod,
Amid the quickening blooms, asleep Earth lay;
Though Spring to her had many a word to say,
And token sweet to bear from Day's bright God."

Then on his pipe he made sweet noise, that woke
The singing fowl by every wood and hill,
And soaring treble from the answering sky,—
Until the sweet unrest Earth's slumber broke :
Though, fearing it a dream, yet bode she still
A little space, till Spring to her did cry."

The landscape-background here is pleasing and well-felt in this simple poetic way. Spring is a Cupid-like boy, poorly drawn: Earth is grand in pose, but her foot somewhat clumsy. Mr. Crane takes a good place among the neo-classicists who seem to think that they must paint goddesses and demigods, but should mingle *naïveté* with abstractness in the form of presentment. Mr. Holiday's female impersonation of *Music* (marked "unfinished," though we hardly know why) has moderate elevation in nude form, with a good deal of nature: she touches a lyre, to the symphonious murmur of the waves on the sea-beach. This portion of the picture, no less than its principal subject-matter, is very attentively studied, and the whole executed with much efficiency.

Mr. John Scott sends two subjects—*The Course of true Love never did run smooth*, and *An Afternoon's Amusement in the Fourteenth Century*, some youths and maidens at archery practice; both tasteful in some fair degree, and seeming to promise agreeable work when the artist's hand shall be stronger, and his practice more assured. Mrs. Stillman's *May-time* represents a loveable hearty little girl, with a face of much sense as well as comeliness, holding a bough of hawthorn over her head in a thicket; she seems to be standing still a moment, to reply to some questioner not shown in the picture. This is a work of fine simple colour, much accurate detail, and no pettiness. The same accomplished lady exhibits two flower subjects, *Chrysanthemums and Christmas Roses*, and *Study of Lilies*—the latter more especially effective. Mr. Hennessy's little picture—*The Offering, Normandy*—is unusually pleasing; we see a baby-girl assisted by her mother, a fisherman's sprightly wife, to set a taper on the metal stand in front of an effigy of the Virgin and Child, placed in a small side-chapel, along with some of the homely votive pictures of ships &c.; a tenderly and nicely felt work. *The Rescue*, by Cabianna of Rome, is an uncommon piece of picturesqueness, in which great artistic value is got out of the long dark stretch of convent-wall, with its darker cypress and other verdure: this is indeed a work not easily forgotten, and ensuring no small popularity to its painter. The figures also have a certain pictorial sense and tact, but, when looked at individually, are peculiarly stolid and ungainly in visage. The incident appears to be a nun carried off from her convent by a party of Florentines of the fourteenth century: but it is not so perspicuously made out, and certainly not so dramatically forcible, as it should in reason have been. *The Pigeons of St. Mark's* is by the same artist, and has suavity as well as vigour of colour. Another painter resident in Rome, M. Charles Bellay, paints, as *Fatima*, an Oriental girl with her brown soft hands clasped over the edge of a brazen platter; an elaborately patterned wall serves for a background. The execution combines depth with softness. Mr. Alfred Emslie has selected a very odd subject to which a distich serves as title; an old white-woolled negro plays the fiddle, seated in the grounds of some house, while a small baby-negro, neatly costumed, and tied in a high chair, laughs with glee, and the pet dog, outstretched in lazy enjoyment, contributes a canine smile to the general satisfaction. This very quaint little picture is carefully as well as dexterously touched. Another example of quaintness is *I'd be a Butterfly*, by Mr. Alfred Ward: a young lady in a dark-blue foulard dress gazing at a yellow butterfly by a rough-hewn wall. Mr. George McCulloch mostly displays a feeling for design, more or less carried out: the work named *Débris*, representing a young woman who has drowned herself—

"One more unfortunate,
Weary of breath,"—

may be cited in proof, but the amount of work in it is scanty. Miss Constance Phillott exhibits *Lucy Gray*, Wordsworth's little secluded country-maid, knitting busily as her bare feet trip along the hill-side path; the artist's conception is fairly enough in harmony with the poet's, and there is an elegant turn in the execution. Mr. Jopling is not entitled to any of the like commendation: he must either have an odd idea of Fielding's *Sophia Western*, or else has signally failed to convey to the spectator any moderately apposite idea which may have been present to his own mind. This Amazon has much more of the *blasé* jaded look befitting one of those heroines, whether of romance or of society, who used to be comprised under the name, "The Girl of the Period." Miss Adelaide Claxton's *Ghost* is, in art, the counterpart of "Pepper's Ghost" in supernature. *A Warder's Dream in the Tower of London* has afforded this lady a great opportunity of introducing a medley of shadow-forms, Anne Boleyn and numerous others: her trick is a dexterous one, but tedious on frequent repetition. We may conclude this section of our notice—the figure-subjects not including the portraits—by calling attention to the following works:—*Sir Peter and Lady Teazle*, A. W. Bayes; *Off Duty*, a member of a sisterhood returning home through the snowy country roads, G. Pope; *Far Away*, Adrian Stokes; *A Crowd, a Sketch at Bergen*, J. Reed Dickinson; *The best Friends must Part*, a sale of lambs to a butcher, E. Penstone; *A Wanderer*, an Italian tambourine woman in a French country-town, G. Clausen; *A Highland Girl*, Townley Green. W. M. ROSSSETTI.

ART JOURNALISM.

Paris: Jan. 6, 1875.

WITH the new year a new Art journal has appeared in Paris. It is called *L'Art*, and is quite original enough in its aspect not to pass unnoticed. It will probably have a satisfactory career, for it was founded by persons who no doubt have a great interest in supporting it. Its very cradle is sumptuous; a publishing office bearing its name has been opened for its special behoof in the Rue de la Chaussée d'Antin, near the new Opera. To introduce it to the world like a young man of fashion, a quantity of very costly etchings have been bought or ordered. It is the first time that we have seen such a *mise en scène* for a journal whose motive power is neither the restoration of a throne, nor a great banking speculation, nor the throat of a singer, nor the legs of a ballet-girl.

In short, it is an interesting fact that a new art journal is being founded among us, which gives good illustrations, which pays etchers and engravers well, and brings together a young and combative staff. The next few numbers will speedily reveal to us what its secret designs are, if it had not for its sole and single object the disinterested propagation of works of art and of the laws which govern them.

Some lines in the Preface, which is signed "La Rédaction," will produce the impression that the idea of this journal originated during the last Exhibition of the Union Centrale. A dealer in pictures and works of art, M. G—, had placed in the rooms devoted to the History of Costume some ancient stuffs and a few portraits of the English school of the eighteenth century. He is an active and enterprising man. He published this winter several catalogues of sales sumptuously adorned with etchings, and it was he also who was the originator of the famous Wilson collection. After lending a part—too large a part—of these plates to the *Gazette des Beaux-Arts*, which I hope, for its own sake, will henceforth renounce such loans, which are more compromising than profitable with subscribers used to unpublished or very scarce engravings, M. G— has just collected them, adding the second part of an American Museum left by America to M. Jules Jacquemart, in a large volume entitled *Conversa-*

tions on Painting. The text is by the present editor of the *Gazette*, M. René Ménard, and an English translation appears on the opposite page by Mr. P. G. Hamerton, who has an article in the first number of *L'Art*.

M. Eugène Véron, formerly editor of a Liberal political journal at Lyons, who has lately published a popular history of the Union Centrale, is the chief editor of *L'Art*. He has rallied round him several well-known names: M. Jules Castagnary, the inventor of the word "realism," and the vigorous champion of Gustave Courbet; M. Jules Claretie, a more indefatigable writer even than M. René Ménard himself; M. Champfleury, a humorous writer, keeper of the Sèvres Museum of Pottery since the Fourth of September. Then comes a whole battalion of young writers, which advances to the attack of the academic doctrine by the French bayonet or by German turning movements. It is these above all—the rest having taken their degrees already—that we would heartily welcome. To the slackness of our art corresponds the slackness of our criticism, which is very far from lacking vigorous and honest men, but which is given to the world in the columns of political journals, that is, precisely where manifold concessions have to be made to the all-powerful class of old subscribers. The *Artiste* is almost dead. The *Gazette* is tossed this way and that without any very clear direction. The daily papers devote to criticism only the space left vacant by politics and the news of the day. For some years the *Figaro* has given the example of a rapid, superficial, ill-informed criticism, without previous education, which amuses without instructing, and confers on the beginners whom it patronises hasty and unwholesome reputations. The *Temps*, the *Débats*, the *Siècle*, and some others only just escape this reporters' epidemic. Again, by being doubly serious, they sometimes fall into the same error as those husbands who, the more cheerful their wives are, grow but the surlier themselves.

There is plenty of room, then, for minds, young, active, laborious, willing to be bound by the modern laws of criticism; to read, travel, frequent artists of all schools and of all countries, to devote themselves in a loyal spirit to certain ideas or certain men, by concentrating on the creatures of their choice all the strength of passion and of reasoning, of information and of public confession. If Eugène Delacroix had had about him ten apostles with the talent and loyalty of W. Bürger, we should have witnessed the complete development of the mightiest genius in modern painting, and the doctrine of David would not have been diverted by the pedants from its true aim, naturalism calling to its aid the study of the remains of antiquity.

L'Art, then, if it favour the new school without systematically disparaging the old, is called to play a part of some consequence. It addresses itself to a wealthy public; for though it is published weekly, and only costs three and a half francs a number, the annual subscription is 120 francs. There is an *édition de luxe* at 400 francs, and another which, like Jean Maria Farina's triple eau-de-Cologne, costs 1,200 francs. I do not doubt that *L'Art* will get subscribers. But I do doubt whether its subscribers will consent to receive their engravings bent double.

The first number contains two etchings: one is by Rajon, a young etcher whom I had the good fortune to bring forward in the *Gazette*, and who is deservedly held in high esteem by amateurs among you, for he is laborious and clever. It is *The Court of a Dutch House*, after that vigorous Pieter de Hooghe, which from Sir Robert Peel's collection passed to the National Gallery. The second is by Boilvin, *The Happy Mother*, a pleasing pastoral composition by François Boucher. Boilvin, who is at least as young as Rajon, is a painter, which makes him aim at colour and life in his engravings. He drew and engraved some very expressive heads for Lemerre's highly artistic

publications. He comes near our vignettists of the eighteenth century. This etching is, by an exception to the rule that each number will only contain one, borrowed from the publication, the title of which I quoted above, *Conversations on Painting*.

The first number contains, beside woodcuts after bronzes in the Museum at Naples, vigorously engraved by M. Méaulle, the facsimile of a pen-and-ink sketch by Gavarni's son, Pierre Gavarni. It is a first attempt, with the exception of some water-colours, which in the last Salon attracted so much attention as to win a medal for the artist, who bears manfully the burden of the name of an artist not appreciated as he deserves in England. M. Pierre Gavarni devotes himself exclusively to the expression of modern life. He is young. He is rich. He has inherited from his father, who was passionately fond of high mathematics, a rigorous taste for the anatomical construction of animals and things. All that he wants is confidence in his pencil and his brush, to render freely the outward appearance of life, luxury, and light. He has contributed to *L'Art* a sketch representing a party of ladies and gentlemen on horseback, and carriages standing at the corner of an avenue. The attitudes are well observed, but it is still forced and dry, like drawings of the German school. Edmond Morin, who is more naïf, is very much more supple. Modern life, a vague term, yet one understood by all unprejudiced minds, is made up—not in the interior, which is permanent like the family, but in its ever-varying passage into the world without—of tones, of effects, of movements, of forms, at once as strongly marked and as fugitive as the aspect of flowers or fruits in their season, or of animals in a state of freedom. The extreme concentration of civilisation which manifests itself in a lady's head-dress or a gentleman's neck-tie, produces the same effect as the green leaves of a birch-tree in spring, or the gilded scales of a beetle crossing a path. To render its extreme unity, one must be either a scholar or a genius. One day Gavarni was met as he was going, gloved and booted, with his hair curled, and a new suit, to the masked ball at the Opera. "I am going to the Library," he remarked. M. Pierre Gavarni has never yet seen the Bois de Boulogne except from the court of the Ecole des Beaux-Arts.

M. Pierre Gavarni is celebrated in this journal in enthusiastic fashion by M. Paul Leroi. There is fire in these juvenile leagues, but how touching is this very naïveté. M. Paul Leroi even goes the length of shattering idols to scatter the fragments on the threshold of his friend. He has attacked Ingres with an energy for which we cannot blame him. It is one of the cries of deliverance of the rising generation. But we must not go too far. Ingres, a negative painter, and still more dangerous as a master, showed the temperament of an energetic draughtsman in his fragmentary pieces, and will live by his studies.

The other articles do not as yet suffice to give the paper a position. Perhaps the proprietors wished at all hazards to appear on the first Sunday in January, when some general rehearsals were still required. M. Eugène Véron's study on Mme. de Pompadour as patron of the arts bears traces of haste. M. Louis Ménard has made a hurried abstract of the latest works on the excavations at Herculaneum and Pompeii. The most original is Mr. P. G. Hamerton's article entitled "Of Nationality in Art." It consists of general considerations on certain natural objects and on certain philosophical entities; the inconvenience of seeing an umbrella brought you, when you had asked with the help of drawing for a mushroom; the revelation of the name of a Scotch landscape-painter, Horatio Macculloch, less "over-excited" than English landscape-painters; the variations of taste according to latitudes. Mr. P. G. Hamerton, beside feeling and judging as an artist, handles our language adroitly enough for

us to have a right to expect from him articles more immediately instructive. We know, for instance, but very little of the history of your arts and artists, past and present. This some writer might well give us, not trying to imitate our modes of procedure, but with form and feelings purely English. The name of such a correspondent would become deservedly popular in France.

PH. BURY.

Jan. 25, 1875.

P.S. I have nothing to alter in the above remarks, the publication of which has been delayed by circumstances beyond my own control. But I do not regret the delay, since it allows me to give a maturer judgment of the new periodical. The later numbers are better in all respects than the first, in point both of text and of illustrations; except the "History of Medal-Engraving during the French Renaissance," a hitherto unpublished memoir, crowned by the Academy of Fine Arts, and mortally dull. M. Paul Leroy has been explaining, or rather strengthening, by excellent reasons, his sharp attack on Ingres—it is a vigorous blow aimed at the pedestal of a plaster statue. The bibliographical department is sufficiently ample, and bears witness to a desire to keep amateurs *au courant* of all that should enter their libraries. There is, however, one great lacuna—the absence of foreign correspondence. This young, vigorous, and active journal must break with the French custom of taking no interest in what is passing abroad, and must bring us into communication with the international artistic and intellectual movement. The later numbers contain some very curious facsimiles of animals, drawn with pen and ink by Auguste Lançon, an artist unknown and misunderstood, deserving in all respects that criticism should pause for a moment before his works. I shall speak of him very shortly.

PH. B.

ART SALES.

THE final dispersion of the great Salamanca gallery of pictures took place on the 25th and 26th at the Hôtel Drouot. The first part of this collection, so celebrated for its fine examples of Murillo, Velasquez, and all the great masters of the Spanish school, was sold in 1867, at the time of the French Exhibition. The fact that the paintings have passed through the galleries of the Infant Dom Luis de Bourbon, the Marquis of Altamira, the Countess of Chinchona, and others of known judgment, is sufficient guarantee for their being genuine. It would appear that the Marquis of Salamanca had two collections—one at Madrid, the other at his country villa at Vista Alegre—and bequeathed them to different heirs. The contents of Vista Alegre form the present sale. Of Murillo, *The Patience of Job* sold for 2,000 fr.; *Moses receiving the Tables of the Law*, 1,200 fr.; *Tobit and the Angel*, 7,000 fr.; *Susannah and the Elders*, 5,100 fr.; *Daniel in the Den of Lions*, 1,000 fr.; *Joseph's Dream*, 750 fr.; *Beggar Boys of Seville*, 1,000 fr.; *St. Rosa of Lima*, 20,000 fr.; *Preaching of St. Paul*, 620 fr.; *Head of St. Anna*, 1,100 fr.; Ribera, *The Immaculate Conception*, 6,050 fr.; *Baptism of Jesus*, 5,600 fr.; *Apollo and Marryas*, 2,000 fr.; Juan de Arellano, *Flowers*, 800 fr.; M. Cerezo, *Apparition of the Virgin to St. Francis*, 3,000 fr.; Alonso Coello, *Portrait of Fernando Cortes*, 1,750 fr., and *Communion of St. Theresa*, 4,700 fr.; C. Coello, *Christ and St. Peter*, 600 fr.; Goya, *Portrait of Emmanuel Garcia*, 1,300 fr.; *Ladies on a Balcony*, 1,750 fr.; *Bull Fight*, 7,500 fr.; and a *Procession*, 5,100 fr.; Juan de Juanes, *Descent from the Cross*, 1,000 fr.; Velasquez, *Interior of an Inn*, 4,980 fr.; *Blind Men playing the Guitar and Violin*, 1,600 fr.; *Portrait of Cardinal Velasquez*, 19,300 fr.; *Portrait of a Lady of the Court of Philip IV.*, 17,000 fr.; *The Dwarf of Philip IV.*, 2,750 fr.; *Portrait of Philip IV.*, a *Sketch*, 4,400 fr.; *Portrait of the Wife of Philip IV.*, 3,050 fr.; Zurbaran, *The Assumption*, 1,010 fr.; and a *Grey Penitent*, 2,200 fr.

Among the paintings of the Italian school were: A. Cuyp, *Sea Piece*, 6,000 fr.; A. Dürer, *Triptych*, 6,800 fr.; Van Dyck, *Portrait of Marquis de Lé-ganès*, 2,500 fr.; of Doña Polixena Espinola, 4,500 fr.; Pieter de Hooch, *Cavaliers and Amazons*, 6,000 fr.; M. Muller, *Fruit Merchant*, 12,200 fr., and *Fishwomen*, 10,000 fr.; Rubens, *Wrath of Achilles*, 13,200 fr.; *Death of Achilles*, 20,000 fr.; *Boar Hunt*, 2,500; Rubens and Snyders, *Nest of Cupids*, 3,150 fr.; Snyders, *The Game Seller*, 6,300 fr.; *Dog and the Shadow*, 4,650 fr.; *Kites and Cocks*, 5,800 fr.; *Cock and Turkey fighting*, 6,200 fr.; Terburg, *Portrait*, 5,100 fr.; P. de Vas, *Boar Hunt*, 5,000 fr.; *Bull Fight*, 2,500; *Rosebuck Hunters*, 3,000 fr. Of the other schools: A. Caracci, *Study of Four Heads*, 4,050 fr.; Falcone, *Attack of a Bridge*, 4,050 fr.; School of Raffaele, *Holy Family*, 3,200 fr.; Claude Lorraine, attributed to, *Dancers*, 6,800 fr.; Largillière, *Portrait*, 1,000 fr. The two days' sale of this important collection realised only 340,390 fr. (13,812l.).

NOTES AND NEWS.

MR. L. ALMA TADEMA has just completed two important works, which are not intended for exhibition in this country. The first is *Cleopatra meeting Mark Antony*. The picture is oval, and contains only the life-size head and bust of the Egyptian queen in profile. She lies, propped up with pillows, the erect vigilance of the head belying the assumed languor of the voluptuous limbs. Her breast is half covered by a tight robe of yellow silk, but neck, throat and arm are bare. All the accessories are chosen with suggestive reference to her life and royal dignity. Out of the masses of her black hair, over her forehead, rises the sacred asp, the symbol of her Egyptian queenship. Round her arm a golden serpent is wound, and from her ear hangs the famous pearl. A tiger-skin, marvellously rendered, seems to embrace her bosom, the head of the beast with its flattened features and blind eyes gazing with a sort of passion up into her face, this being designed partly to give rotundity to the composition, partly to illustrate the thought that this woman's beauty was so all-powerful that even inanimate things were stirred by it. But hitherto we have mentioned the surroundings only. The Cleopatra herself is the most consummate triumph of the whole. With the intense fire of her eye, constraining herself to be calm, she follows, she is supposed to have just fascinated, the eye of Mark Antony. She is balancing in her mind the power of her charms; the whole posture and expression reveal a sensuous woman of reckless and fascinating loveliness at the very moment of conquest; the hero is not yet at her feet, but the peculiar satisfaction of the lips, the peculiar glitter of the eye, show that she is certain of her triumph. The painter has founded his conception of the face in some degree upon the well-known head of Berenice, the mother of Cleopatra, but the outlines are in all cases fuller, the lines more voluptuous, the whole face more exciting, commanding and overpowering. The picture is painted in Mr. Alma Tadema's brilliant way; nothing can be more dazzling than the skin of the Queen, more radiant than her eye. It has also a special interest as a triumph gained by the painter in a manner of treatment hitherto unfamiliar to him. The other new picture, *A Peep through the Trees*, is in the style more customary in the painter's later works. It is an English landscape in July; a woman, robed in a long soft garment of blue-grey, with a pale brown drapery rolled under her head, lies on her back in a beech-wood, gazing up between the boles of the trees to catch a glimpse of the sky between the leaves. The spectator has a quite different "peep through the trees." Through the trunks, and over the brown grass and underwood, he catches the full evening light of the sky, and a luminous line of meadow and plain far below. The composition is

very sweet and harmonious. The woman holds some autumn flower listlessly in her hand, but the feeling of the deep leafage has overpowered her. She lies back in the soft bed of the grass as in a grave, and her limbs are placidly laid out almost as if in death. The whole is hardly an idyl, but rather a reverie or a recollection, a single poetical chord struck in tones of sombre and delicate colour.

FROM a return which has just been made, in compliance with Lord Hampton's motion, we gather that there has been expended in the diocese of Hereford since the year 1840 no less a sum than 435,579*l.* upon church building and restoration. In an agricultural diocese such as that of Hereford, it is obvious that the greatest part of this sum must have been spent upon restoration, and we find that more than 200 of its churches have been subjected to this hazardous process. While honouring the zeal which has been able to accomplish so much, we cannot help fearing (and knowing) that it has not always been tempered with discretion. An unrestored church is rapidly becoming a curiosity, and in the next generation both antiquaries and architects are likely to suffer from want of occupation. In their interest, as well as in that of the buildings themselves, we would urge a little less haste.

AT the last meeting of the Royal Archaeological Institute, on Friday, February 5, at 4 P.M., was exhibited a very interesting addition to the already-known authentic portraits of Michel Angelo Buonarrotti. It consists of a medallion portrait in wax, which there is every reason to believe the original, modelled by Il Cavaliere Leo Leoni, of Arezzo, from the life, from which he executed the medallion signed by him, and noticed by Vasari as one of the few undoubted portraits of the *maestro*. A discourse referring to the circumstances connected with the discovery of this relic, and to the other known portraits of the sculptor, was read at the meeting by Mr. C. Drury Fortnum.

THE *Gazzetta di Venezia* of the 24th ult. gives the account of an important discovery at Fonzaso, near Treviso, on the property of Signor Buzzati. In excavating round the foundation of an old castle, one of the line of fortresses built to defend the road from the Valley of Belluna through the Rhaetian Alps to the German territory, the workmen came upon a large basin slightly concave, upon which rested another basin inverted over the other. Above the second basin lay a cup, also inverted, and carefully fitted together. On further examination, these vessels proved to be of solid silver, weighing in all 2 kilogrammes 130 grammes.

The larger basin had concentric rays radiating from the centre, and terminated by a circular line, round which was incised in Roman characters *Geitimir Vandolorum et Alankorum Rex* &c. The basin measures 49 centimètres in diameter. The other, of more finished workmanship, two thirds of the size of the first, and a little more concave, has in the inner side, impressed in relief in repoussé, three figures, representing a helmeted warrior, spear in hand; a young woman attired, her head crowned, and a bouquet of flowers in her hand, and a child standing between them; behind is a covered urn, and on the other side what appears to be a column. The cup inverted over the basins has the outside edge ornamented with arabesques in relief. These pieces may have constituted part of a service for the use of the royal Vandal table, or perhaps, to judge from the subject, for a marriage ceremony. The description recalls the "Treasure of Hildesheim," so well reproduced by Christoffe, and which was described in an early number of the ACADEMY.

M. CLÉINGER has just finished a bust representing "La France" that is greatly admired for its calm power and originality. "C'est la France," writes a French critic, "cuirassée et casquée, non point belliqueuse, mais prête à la guerre."

IN Mr. Greville's *Memoirs*, it appears that he presented the Madonna of the Pantheon with a

model horse-shoe (of silver?), duly inscribed, by which he sought to win the Virgin's favour in a race in which he had a horse engaged. This strangest of all donations ever made is lost. On enquiry it was stated that it had been removed by a sacristan, who thought a horse-shoe (it was declared to be only of iron) was an unbecoming gift to the Queen of Heaven; and on a suggestion that the horse-shoe was silver, not iron, the official professed ignorance. Subsequently he modified his statement by asserting that it was lost in the flood of 1872, which inflicted so much damage upon the altars and interior of the Pantheon, and repeated his assertion that it was only a piece of iron. Whatever Mr. Greville's gift was made of, it has disappeared; but whether in consequence of the conscientious scruples of a sacristan, or by the waters of the Tiber, it is hard to say. It might be thought that metal offerings, if washed down, would lie on the pavement when the waters subsided, and could hardly be removed unless very little supervision was exercised over those who swept the mud away.

Pius IX. has not fallen behind his predecessors in restorations and preservations. Those executed in Sta. Maria in Trastevere are very splendid; the pavement in "Opus Alexandrinum" is especially superb. The church of Sta. Maria sopra Minerva does not present a good instance of restoration, although it is evident that an enormous sum has been expended. The clustered piers are covered with *scagliola*, representing a grey-veined marble; and however well they may be done, still they are evidently false. The ribbed and vaulted ceilings are painted blue in the mediæval manner, with mosaic borders and gold stars after the old fashion; and groups of prophets and saints are represented in a later style floating in the blue ether, which somehow have a very modern look. The apse is filled with painted glass by Pompeo Bertini, of Milan, with all his unsurpassed skill of drawing and painting, and with all his usual indifference to congruity of style; and the *occhi* or round windows of transepts and clerestory are filled with kaleidoscopic patterns which it would be cruel to assign to any artist whatever.

The result of all these decorations and darkenings is that the *Christ* of Michel Angelo is thrown into such profound shadow that a work of art which, despite its admitted defects, is worth all that the church contains, is extinguished. It can only be examined, at all events on a winter day, by standing within a foot of it; further off it is a dark mass, the outline only of which is visible.

AN annual pension of 1200 francs has just been granted to Millet's widow, on the recommendation of the Director of Fine Arts.

THE Galerie Lenoir in the Museum of the Louvre has just been opened. The donor of this curious collection is a former proprietor of the celebrated Café de Foy, in the Palais Royal, rendered popular by the swallow which Carle Vernet painted upon the ceiling. Having amassed an immense fortune, and having no son to inherit it, Philippe Lenoir amused himself by forming a collection of snuff-boxes, which, by the will of his widow, is bequeathed to the Louvre. Mme. Lenoir has left the rest of her fortune to the "Assistance Publique." The collection is divided into six divisions—the snuff-boxes, enamels, miniatures, ivories, jewels, and old lacquers. The great attraction consists in the snuff-boxes, so many masterpieces of the ornamentation to which the goldsmith's art was applied in the eighteenth century with such taste, and such diversity of invention. Some of these boxes are valued at about 12,000 francs (480*l.*) by the experts, a figure which is not astonishing when the wonderful workmanship which enhances the value of the materials employed is closely examined. These materials have served as divisions for their classification: the first comprises the snuff-boxes in pietra dura, mosaic, incrustations, mother-of-

pearl, and burgau; the second, those of gold, of gold and enamel, and of gold and cameos; the third, the enamelled snuff-boxes; the fourth, the paintings mounted upon the boxes; and the fifth, various compositions. For a detailed description, we refer the amateur to the admirable catalogue prepared by MM. Barbet de Jouy, &c., in which each piece is described with a technical precision which leaves nothing to be desired.

AN exhibition of the works of Maxime Lalanne is being held at Bordeaux. "France," says the *Chronique*, "is beginning to acclimatise the English custom of having small private exhibitions of artists' works." Lalanne's works were exhibited some months ago at the Cercle de la rue de la Chaussée-d'Antin, and achieved a great success. The catalogue enumerates nearly 400 drawings of various kinds, ninety-nine etchings, three lithographs, and eight wood engravings, beside some interesting photographs from drawings not exhibited.

AN important archaeological discovery has been made, says the *Bulletin Français*, at Bourbonnes-les-Bains (Haute-Marne), a little town resorted to by the lame and paralytic for its thermal waters, which were well known to the Romans, who had here an important station where persons of distinction, as well as those unfavoured by fortune, came annually to leave their infirmities or drown their *ennui*. In executing soundings in the thermal reservoir there have been found already more than 4,000 pieces or medals in bronze, 300 of silver, and several pieces of gold, embedded in the clay of the river, which have been placed in the museum of the town. The gold pieces, of which the largest are of the size of a forty-franc piece, bear the effigies of Nero, Hadrian, Honorius, and Faustina, and are thought by archaeologists to be *ex-voto* offerings made by the sick. Beside these medals, there have been found a considerable number of pins and rings of finished execution.

THE *Allgemeine Zeitung* for January 29 contains an interesting report by Dr. Schöner of the most recent excavations at Pompeii, where, in a lately uncovered house, which was apparently only half-completed at the time of the destruction of the city, a splendid fresco of Orpheus charming the beasts of the forest has been brought to light. The figure of Orpheus, which is nude, is, according to Dr. Schöner, one of the most perfect as yet found. In the grandiose but perfectly symmetrical proportions of the limbs, the beauty of the face and head, and the power and calm abstraction in the expression and attitude, it has more of the divine than the human character; while the bright glow of the landscape which forms a framework to the figure contrasts strikingly with the characteristic wildness of the animals grouped near him, to which he seems to give no attention, while he looks forth into the far distance as he strikes the lyre which rests on his knee. Accessory groups of strange and brightly plumed birds, and of various domestic animals, fill up ivy-framed compartments of the wall on either side, and with the main group constitute one grand whole, which must be ranked among the most beautiful of the rescued remains of Pompeian art.

INTERESTING excavations are in progress in front of the portico of the Pantheon, following up others made some time since on one of the flanks, which revealed solid thick walls encrusted with marble, indicating that the design of the exterior was at one time very different from what it now is. The new excavations, which are about five and a half feet deep, reveal the original steps for ascending to the portico, the pavement of which is now lower than the level of the piazza. It was, therefore, once at least five and a half feet higher. There are considerable remains of three steps, each having a rise of a foot, and in front of them are the large travertine slabs of the original pavement. Two panels of the friezes of candelabra and

festoons which decorate the interior and exterior of the portico have been found, and also a block of marble, part of a frieze and architrave richly decorated, which is sculptured internally and externally; singularly enough, the subject of the frieze—lions drinking water from large vases—is the same on both sides. The sculpture is not of a high order. It is understood that the lofty iron railings which are at present placed between the noble granite shafts of the Corinthian order of the portico, and which sadly disfigure it, are to be moved to the outside of the new excavations. This is an admirable idea, but perhaps it would be well also to diminish the height of these railings. The name of Pius IX. will be remembered as long as the Pantheon endures, by the restoration made at his expense of the superb marble pavement, a work worthy of the age of Augustus.

THE *Zeitschrift für bildende Kunst* for January is particularly rich in interesting matter and illustrations. 1. We have a continuation of Robert Vischer's *Stenische Studien*, in which he describes the curious old frescoes by Simone Martini and other masters of the Sienese School in the Palazzo Pubblico. These frescoes have already been described in Crowe and Cavalcaselle's History; but Herr Vischer's independent study and criticism of them is particularly valuable. A beautiful, graceful head representing Concordia, by Ambrogio Lorenzetti; a quaint resurrection of the Virgin, with many figures, by Taddeo Bartoli; and Sodoma's splendid figure of San Vittorio, illustrate the subject well. 2. The conclusion of Dr. Woltmann's long critique on the Suermondt Gallery. 3. A letter from a Boston correspondent respecting the projected Exhibition at Philadelphia. 4. Some newly-discovered particulars about an artistic family named Knop, who appear to have lived and worked in Münster at the beginning of the seventeenth century. They were artistic workers in metal, and executed much of the splendid armour of that period. 5. A short but graphic account of the excavations at Pompeii, and their most recent results. If the excavations are continued at their present rate, it is reckoned that the whole of the town of Pompeii, of which about a third is now laid bare, will be uncovered in the space of seventy-two years.

The larger illustrations of the number are an etching by Leopold Flameng of a winding river landscape by Hobbema, and one by W. Unger, of three Flemish Graces by Rubens.

THE STAGE.

"HOME."

Home might have had some interest as a strong drama, if the author had not endeavoured to make it a comedy: it might have had much merit as a comedy if the author had not endeavoured to make it a strong drama.

The principal characters are an adventuress and a well-disposed young gentleman who baffles her projects; and had Mr. Robertson kept the character of the adventuress, as he has undoubtedly kept that of the young gentleman, within the modest limits of English domestic comedy, the work would have been harmonious, and the result just pleasantly laughable. But M. Augier's *Aventurière* furnished him with his plot; that is, he followed the lines laid down by a writer who grapples with important problems and makes a serious study of all the subtleties of character and emotion. To show elaborately, among many other things, the soul of goodness in things evil, is work congenial to Emile Augier, and work for which he is fitted. Mr. Robertson had no taste for that kind of analysis; and probably no talent for it.

Here, in *Home*, writing for a larger stage than the Prince of Wales's—a stage demanding greater effects than the effects of witty charades in a parlour—he did venture on more difficult ground. It was not new to him to give some serious in-

terest to his pieces, but the serious interest had generally been idyllic. Here it is meant to be very strongly dramatic. You are to sympathise very keenly with a woman, whose scoundrel of a brother does for her what Edith Dombey's mother did for her—teaches her, that is, to display herself to advantage, and to sell herself to the best bidder. She recoils from all this, and feels the shame of it, and has a long scene of passionate avowal of her past, and a fine moment of amendment. But in all this Mr. Robertson is strangely out of his element. The words and the thoughts proper to the many situations she passes through came to him apparently with difficulty. And yet of all the serious interest that is in the piece, hers is treated the best. Other characters have serious interest, or are meant to have. The well-intentioned young man who is to baffle the adventuress, in her hunt for the hand of his father, comes back from America, when his friends have thought him dead. He comes back as somebody else, so that his father shall not suspect his plan, and he tells his sister who he is. The sister receives the intelligence that he is not dead but living—nay, here beside her—as the most natural thing in the world, and as a rather good joke, into the bargain. She laughs; he kisses her—she proceeds to eat chocolate. She is seventeen, and has a lover, and he too finds the happiness of courtship to consist of eating chocolate *à deux*. Again, when the father receives a letter informing him that the long lost son is alive, he has hardly more than a sentence to say about it. He lifts his hand, and—being about as genuinely surprised as a man is when he receives a "testimonial" from his admiring friends—observes to Lucy, "Your brother Alfred is alive," or words to that effect, and soon he proceeds to the transaction of ordinary and social business. There is a ludicrous want of just proportion in a scene so conceived and executed. I don't suppose the spectator can for an instant believe in its reality.

On the other hand, there is a good deal of accepted fun, though chiefly fun of the kind that is produced for the benefit of Mr. Sothorn. The drunken scene, when the adventuress's brother calls for his host's champagne at early lunch, and passes through various stages of intoxication until he lies helpless on the drawing-room sofa when he should be giving his arm to one of the young ladies, is not only farcical, but entirely superfluous. It is none the better because it is fairly acted by Mr. Rogers. It leads on to nothing whatever in the piece, and concludes the first act feebly. Of Mr. Sothorn's love-scene (that is, Alfred Dorrison's, with the young visitor, Dora Thornhaugh), more is to be said in praise. It drags a little at first; it reminds you too much of the Dundreary you would fain forget; but as it goes on it improves—really tells upon the action and progress of the piece, and besides that, has some delicate touches which are true to the art of domestic comedy and to the nature of commonplace young people.

Mr. Sothorn's acting with Miss Ada Ward—Mrs. Pinchbeck, the adventuress—is quite as good, though not so characteristic, as his acting with Dora (Miss Dietz). A vein of well-preserved irony runs through all his love-making with her; and he makes love to her, remember, only that she shall release his father, being fascinated by the position of the German Count, whom he represents himself to be. The few serious utterances given to Mr. Sothorn to make are delivered well and genuinely; but Mr. Sothorn in serious moments turns away his face from the audience, so that little facial expression is seen or attempted. His acting, as far as it goes, is undoubtedly good; but the part might be much finer, if Mr. Sothorn made a greater demand on his own powers, and, in giving the character its proper scope and range of naturally exhibited feeling, aimed to be here a high comedian as well as a comic actor.

Miss Ada Ward's performance of what might be a very great part indeed, is better at the end

than at the beginning. The first scene is decidedly unhappy. Here the tone is dramatic; the emotion forced and exaggerated. But her performance notably improves as it proceeds, and leaves on you at last the impression of many spontaneous gestures, many pathetic details. The gentleness of her love scene with Dorrison is well-nigh all that it should be. It cannot quite rise, as a great French artist to the scene in which the adventuress profits by her brother's bargaining and wins for her behalf, and tears up the cheque which Dorrison has written and given her as the price of her peaceful departure.

As the young lover of young Dorrison is a lad who, as some cynic says, is just as when lovers are most in earnest—Mr. Sothorn makes a first appearance on the stage, and plays his part with a little roughness, perhaps, but at least very good-humouredly, on the whole very well, with a good deal of promise. Lucy, whom this youth, Bertie Thompson, has his early loves, is represented by Miss Walton, already an established favourite of Haymarket audiences. The actress looks upon, and sets herself with a will to play, she is playing. But she has hardly the air of a true *ingénue*, so rare to find on the stage; so much more readily found on the French, owing to one wonders what infuses French life, of French manners and ideas. The Lucy Miss Walton represents is what the public. She is indeed agreeable, child-like; jolly, but not naïve.

FREDERICK WELLS

MR. CLEMENTS MARKHAM—Secretary of the Geographical Society—writes to us, of course officially, that he is anxious to get many theatres to present the Arctic Expedition, any dresses and other properties they may wish to spare. "Theatricals and fancy dresses," he writes, "proved an important resource in the minds of the men healthily employed on our expeditions, so that if the managers could give any contributions they would really be of a national service." Theatrical people are verbally prompt to do good service, and possibly some of the managers may be inclined to take up Mr. Markham's suggestion; or it might perhaps be thought advisable to open a subscription list, so that private persons might have an opportunity of contributing their part in so good a work, with which, we are sure, there would be very general sympathy.

IN the ACADEMY, "Mr. Wedmore"—our weekly theatrical paper in its last issue—has named dramatic articles, and they have been. He declares that both Mr. and Mrs. Keble have the habit constantly of false accentuation. "I have thought so before, but few people have said it." The criticism, whether true or not, can only have been by a slip of the pen attributed to Mr. Wedmore. It is not his, nor that of any other writer in this journal.

Maggie's Situation is the name of a short farcical comediotta to which a prominent place is now given in the bills of the Court Theatre. The piece is by Mr. Madison Morton, and is not out good points, to which the acting of Mr. Bruce, Mrs. Chippendale, and Miss Marie give force; but *Maggie's Situation* is without importance, though its merits and those of the actors are enough to keep it for some little time in the programme.

THE New Royalty Theatre opened its doors Saturday night, with the first English performance of one of Offenbach's best opera bouffe, *Périorchle*—and with an adaptation from the French, called *Awaking*. Of the latter piece of its interpretation by Mr. Stephens, Mr. Rayne, and Miss Bessie Hollingshead, then

reek be something to say in these columns. of course nothing whatever in common with *La Périhole*, which may well be separately of. Jacques Offenbach's opera bouffe its heroine a street singer—a good-looking young woman who is greatly attached to her habitual companion, one Piquillo, another singer. Like most of the heroes and heroines in opera bouffe, they live in an ideal world, with no morals have nothing to do—and it is quite an offence that in a world that makes no pretence to resemble ours, *La Périhole* should have the ceremony of marriage, in consequence exceeding costliness. The Viceroy sees her enamoured of her—this is in Peru, but the eye must still discern some world other than our own and he desires to bring her to his palace, but she forbids the presence of spinsters there. He must find an official husband for the Viceroy, and she chooses Paquillo himself. In this way they are to be married, and a young couple get a good meal at the wicked Viceroy's expense, and afterwards the Viceroy's plans are thwarted and the faithful *Périhole* lives for ever, with the faithful Paquillo. All done—except indeed the living happily for the accompaniment of Offenbach's best. If the piece is trivial in subject, the performance is excellent. There is a good orchestra, a small one, and there is an efficient chorus, the scenery and appointments are suitable and bright, and the minor parts are well done. So far the various accessories, all of which are, for the most part, of much importance to success. A word of the leading performers. Mr. Sullivan is very good as the Viceroy, and Mr. Fisher very satisfactory as the faithful lover. Mme. Dolaro is *La Périhole*, and the best *Périhole* to be met with. Those who are not great admirers of Schneider must be much to say that Mme. Dolaro's representation is better than Schneider's. It is, in truth, very better; for while very spirited, it is refined and graceful. Of course the drunken-song is a little in the way, but it is pretty well overhauled while for Mme. Dolaro's rendering of the "letter-song" and of the Spanish quasi-melody, there can be nothing but praise. Mme. Dolaro has rapidly taken her place as the best because at once the most complete and versatile of English actresses in opera bouffe.

The comedy of *Home*, duly noticed above, does comprise more than half the programme at the Haymarket Theatre, where the piece is presented by *A Fair Encounter*, which is a graceful trifle from the French, played by Miss Dietz, Miss M. Harris, and is succeeded by the *Family*, in which Mr. Buckstone's performance, as Aminadab Sleek, calls forth as much as it has called forth at any time these years. But neither piece calls for any considerable discussion.

The *Merry Wives of Windsor* is to be succeeded, at the Gaiety, by *A Midsummer Night's Dream*, said.

On Ash Wednesday question has been revived again, and Mr. John Hollingshead has written the following letter to the Lord Chamberlain:—My Lord,—I beg to forward your lordship a printed paper signed by the members of my company protesting against the compulsory closing of theatres on Ash Wednesday, and I also enclose a few letters received by me which show the different exemptions to the Ash Wednesday rule existing in different parts of the country. Imitating your lordship's example on a recent occasion, when you had a printed circular to theatrical managers, I have this correspondence to the press, so that the case may be in a position to judge between us. This question will probably be brought before Parliament in the session, in connexion with an attempt to be made to remove the illegality of morning performances at concert rooms and entertainment houses. The moment that brilliant sample of an- legislation (the 25th Geo. II. cap. 36) is brought before the House of Commons to be patched and

mended, the defects of our present licensing systems will have to be discussed and remedied.—I remain, my Lord, your Lordship's most obedient servant, JOHN HOLLINGSHEAD.

The following is the Protest, which accompanied the letter:—

"We, the undersigned members of the dramatic profession and of Mr. John Hollingshead's theatrical companies, beg most emphatically to protest against the law, custom, whim, and prejudice which compel us to remain idle, and to earn nothing on Ash Wednesday, while the three millions of people, more or less, in London, not being members of the dramatic profession, and the twenty-seven millions of people, more or less, in the suburbs and throughout the country, whether members of the dramatic profession or not, are at liberty to work on that mysterious day, in any moral or immoral, active or passive way, in which they are accustomed to work throughout the year."

Among the chief members of the profession (belonging at present to Mr. Hollingshead's companies, and so signing the protest) are Mr. Phelps, Mr. Hermann Vezin, and Mr. and Mrs. Kendal.

THE second part of M. Legouvé's *conférence* on Samson and his pupils was even more interesting than the first, of which we gave a few notes last Saturday. In the second part, the author of *Adrienne Lecouvreur* spoke of Samson's relations with Rachel. Rachel repaid him his pains, more than any one else, and she got from him more than any one else. At the end of her career, just as much as at the beginning, she depended on advice as to how she should play each character; and Samson's counsel was of the utmost use to her from the time when she began, to the time when the two became estranged. He recognised from the first her power; but her power was not so much of conceiving a whole character as of finding, at isolated passages, cries and expressions of amazing significance and genius. She knew this herself, and when they quarrelled once or twice before their final rupture, she said—so says M. Legouvé—"J'ai tout perdu en perdant M. Samson. J'en mourrai! Je veux quitter le théâtre. Je ne puis rien sans lui." When it was objected to that, that she should rely on her own genius, she answered, "Oui: je me sens née pour aller très haut. Mais je ne peux pas m'élever seule. Je trouve bien des effets isolés, des mots de passion, des accents de vérité, mais l'ensemble d'un rôle m'épouvante." And afterwards she said that Samson alone guided her. "He gave me ideas, which in their turn gave me other ideas." And anyone who has any serious knowledge of the art of acting will understand that expression of hers "l'ensemble d'un rôle m'épouvante," and will not draw from it the inference that Rachel was less great than she has been considered to be. "Very blind and very ungrateful would those be," M. Legouvé justly adds, "who should see in this marvellous artist only the echo of her master. Samson did not create Rachel. He evoked her." Samson, it is further related, had all the traditional reverence for Corneille and Racine. Once, when Théophile Gautier had confided to him one of the most important dramatic feuilletons in Paris, he spoke slightly of these two French classics. Samson could not restrain his rage at what he considered almost blasphemy. It did not matter if he offended Gautier—he rather willingly embroiled himself with him. "Il se précipita," says M. Legouvé, "avec l'impétuosité d'un fidèle qui défend ses dieux." And if Samson loved all the old traditions of the French Theatre, he was very jealous of its good fame. He felt very keenly how much *esprit de corps* was wanting in his profession, and it was he, along with Baron Taylor, who established the Society of Dramatic Artists. Union, which had done so much for the clergy, for the bar, for the profession of medicine and the profession of literature, should do something for actors too. Only after Samson retired, in his old age, did he receive the decoration of the Legion of Honour. Official France does not always share the views common in French society, and

the authorities who did at last tardily "decorate" Samson, wished the decoration to be made the occasion of a promise by him that he would never again appear upon the boards. "Jamais!" he answered, indignantly, "je n'achèterai un honneur au prix d'une lâcheté, et je ne renierai pas toute ma vie sous prétexte d'en décorer la fin!" His pride, as we know well, was not only personal pride, or pride in his profession and his triumph in it; it was also pride in his country. He was always intensely patriotic, and M. Legouvé might have added, what he must well have known—that he died not so much of old age or disease as of torture at his fatherland over-run and humiliated. He retired, we know, to Blois. In time, the Prussians got there, and that finished what other troubles had begun. The proud and sensitive old man died of the effects of that shock.

MUSIC.

CRYSTAL PALACE—BEETHOVEN'S MASS IN C.

THE Saturday Concerts at the Crystal Palace are so uniformly good that one can hardly venture to use with reference to any one of them the phrase "of more than usual interest." Nevertheless, I feel almost tempted to say this of last week's concert, because it gave amateurs an opportunity of hearing one of Beethoven's greatest masterpieces, which is but seldom performed on a scale at all adapted to its adequate presentation. This was the mass in C, the first of the two with which the composer of *Fidelio* enriched the music of the Catholic church. The work is not infrequently to be heard with orchestral accompaniments on festival days in our Roman Catholic churches; but with a necessarily small band and chorus, such as is available on these occasions, much of the effect, especially in the more massive portions of the music, is inevitably sacrificed. It was therefore a great treat to hear a performance of the mass with such a band and chorus as those over which Mr. Manns presides. It had been once previously given at the Crystal Palace, on November 5, 1870. It has also been occasionally produced by the Sacred Harmonic Society, but the enormous vocal and instrumental force engaged at the concerts of this society is as much too large as an ordinary church choir is too small; the proper balance of tone is destroyed altogether, and many of the more delicate effects are indistinguishable.

The Mass in C was composed in the year 1807, shortly after the pianoforte concerto in G, and the overture to *Coriolan*. It was written for Prince Nicholas Esterhazy, the patron of Haydn, and, on the authority of Herr C. F. Pohl, of Vienna (quoted by "G." in last Saturday's programme), was first performed in the Prince's chapel at Eisenstadt on September 13 of the above-named year. It was not, however, published until 1812.

None of Beethoven's works are more representative of what is commonly known as his "second style" than the present mass. From the first bar to the last it bears the strongly-marked impress of his originality. Nothing can be more unlike an average mass by Mozart and Haydn than the mass in C. The very first movement, the "Kyrie," shows the difference at once. In Haydn's six grand masses, written for the same Prince Esterhazy, for whom this work was composed, the prayer "Lord have mercy upon us," is generally set to extremely lively music, which offers the flattest contradiction to the sense of the words, and which can only be explained by Haydn's own remark that the thought of God's goodness filled him with such joy that he believed he could not help setting even a "Miserere" in *tempo allegro*. Beethoven, on the contrary, treats his "Kyrie" in a strictly devotional spirit, as it is also treated by Cherubini and Schubert in their masses. The final "Dona nobis" is a similar instance of the attention paid to the spirit of the words. It was the custom with Haydn and Mozart to conclude their masses with a brilliant

chorus, suggestive rather of a feeling of relief at getting out of church than of a prayer for peace. Beethoven ends his mass with a reminiscence of the opening movement, his music dies away in an impressive *pianissimo*. Space forbids entering in detail into all the numbers of this great work; nor can I do more than mention the exquisite beauty of such slow movements as the "Qui tollis" and the "Et incarnatus," or the grand effect of the "inverted pedal" (the upper G held by the treble voices against the moving harmonies of the other parts) in the great fugue which concludes the "Gloria." But a word or two should be said of the fugal writing; and the more so because it is frequently asserted that this was Beethoven's weak point. It is true that in his works *strict* fugues are seldom, if ever, to be met with; but this is because with him the fugue is a means of expression, not the end—not what Dr. Bülow, speaking of Bach's fugues, has so happily described as the "Selbstzweck-Fuge." Such movements as the "Cum Sancto Spiritu" and the "Et vitam" prove clearly enough Beethoven's mastery of counterpoint; and the very licences which he here allows himself are the results of design, not of incapacity. The rules of the school were his servants, not his masters.

The performance of the mass on Saturday was in many respects admirable. Mr. Manns's "reading" was very judicious, though I could not but think that he took the "Kyrie" perceptibly slower than Beethoven designed it. The pace of the other movements left little or nothing to desire. Again must special praise and congratulation be given to the Crystal Palace choir, who fully realized the expectations raised by their excellent performance at previous concerts this season. The chorus parts are by no means easy, and they were, with one or two very trifling exceptions, most admirably rendered, not only as regards precision, but still more in respect to the observance of the *nuances*. The piano singing in the "Qui tollis," "Benedictus," and elsewhere was all that could be wished. Of the orchestra it is superfluous to speak; their share of the work was simply perfect. The solo parts were on the whole less satisfactory. Miss Blanche Cole, who sang the soprano part, is much more at home in operatic (in which, as is well known, she excels), than in sacred music; nor did Miss Julia Elton appear very comfortable with the alto solos. On the other hand, Mr. Vernon Rigby and Mr. Lewis Thomas (though the last-named gentleman was suffering from indisposition) were both heard to advantage.

Beethoven's Mass was not the only specialty of the afternoon. True to their principle of giving, if possible, some absolute novelty at each concert, the programme included Reinecke's arrangement for orchestra of Schumann's six pianoforte duets entitled "Bilder aus Osten." The work in this form is only just published, and was announced on the present occasion as for "the first time in England." In their original shape the "Bilder aus Osten" are well known to pianists; and from their construction and the comparatively very small amount of mere "passage-writing" which they contain, they for the most part adapt themselves admirably to the orchestra. The first, fourth, and fifth numbers are especially successful in their new dress. In addition to Sullivan's "In Memoriam" overture and various vocal solos, the concert brought to a hearing, for the third time at Sydenham, Brahms's fine variations on a Theme by Haydn. It was certainly an error of judgment to put this elaborate piece at the end of a long programme. It was impossible that an audience, who had already been listening for nearly two hours, could properly enjoy a composition requiring such close attention for its full appreciation.

To-day Herr Joachim will make his first appearance this season in a concerto of Spohr's, and a new nocturno of his own.

EBENEZER PROUT.

By the lamented death of Sir William Sterndale Bennett, which occurred on Monday last, the 1st inst., English music has lost its most distinguished representative. It is but rarely that any English composer succeeds in gaining a continental reputation; but it is hardly too much to say that the name of Bennett was as well known in the musical centres of Germany as in London. He was born in 1816, in Sheffield, his father being an organist of some distinction in that town. He lost both parents at a very early age; but his musical talent being recognised by friends he was sent, in 1824, to King's College, Cambridge, as a chorister in the chapel. Thence he proceeded to the Royal Academy of Music, where he studied under Dr. Crotch, at that time principal of that institution, and Cipriani Potter. At this period he produced some of his best works, among others his pianoforte concertos in C minor and F minor, and his overtures to *Die Naiaden* and *Die Waldnymph*. In 1836 he visited Germany, and was fortunate enough to gain the friendship of Mendelssohn and Schumann. The former introduced his chief works at the celebrated Gewandhaus concerts at Leipzig, of which he was then conductor; while the latter, at that time editor of the *Neue Zeitschrift für Musik*, lost no opportunity of calling his readers' attention to the merits of the young Englishman. Under these circumstances Bennett's music was, as it deserved, most favourably received. On his return from Germany he resumed his professional work in London, and was equally esteemed as a pianist and as a teacher. In 1856 he was appointed Professor of Music in the University of Cambridge, and in the same year became conductor of the Philharmonic Society, which post he held for twelve years. In 1858 he composed his cantata *The May Queen* for the Leeds Festival held during that year. In 1862 he was selected to compose a work representative of English music for the opening of the International Exhibition, the poem being written for the occasion by Tennyson. In 1867 he composed for the Birmingham Festival his oratorio *The Woman of Samaria*. In 1868 he succeeded Mr. Charles Lucas as Principal of the Royal Academy, a position which he continued to hold till his death. He received the honour of knighthood in 1871. As a composer Sir Sterndale Bennett belonged to the school of Mendelssohn. His works resemble those of that great master, not only in the nature of their ideas, but in the beauty of their artistic finish. Like a true musician, he never wrote down to the popular taste. His most recent compositions, the symphony in G minor (lately performed at the Crystal Palace), and the pianoforte sonata "The Maid of Orleans," show the same purity of style and delicacy of workmanship which elicited the praises of Schumann and Mendelssohn nearly forty years since. Of Bennett's ultimate position among composers it would be premature to express an opinion; of his beneficial influence on music in this country there can be no doubt. In his personal relations he was esteemed and respected by all who knew him.

THE almost inexhaustible richness of the repertoire of Haydn's eighty-three quartets was proved at the last Monday Popular Concert by the introduction for the "first time at these concerts" of one of the finest of the series—that in B flat, Op. 71, No. 1. It might have been supposed that all the best quartets would, ere this, have been heard at the more than five hundred concerts already given; but there seems no limit to the supply of fresh beauties to be found in Haydn's chamber music. Space will not allow a detailed notice of the quartet, which was admirably played by Mdme. Norman-Néruda, and Messrs. Ries, Zerbini and Piatti. The pianist was Dr. Bülow, who introduced as a novelty Raff's very clever and interesting Suite for piano solo in E minor, two movements from which he recently played at one of his recitals. The other concerted pieces were Beethoven's sonata in A, Op. 30, No. 1, and

Spohr's trio in A minor, both of which had been previously given at these concerts. Miss Alice Fairman was the vocalist, and Sir Julius Benedict the conductor. On Monday next, Herr Joachim will make his first appearance at St. James's Hall for the present season.

HERR WILHELMJ was again heard on Tuesday night at the Royal Albert Hall; when, in a new concerto, composed expressly for him by F. Hégar, he again showed himself one of the first living performers on the violin. The work is of considerable interest and much novelty of form. The programme also included Mendelssohn's "Italian" symphony, the overtures to *Der Freischütz* and "In Memoriam," which last was also played at the Crystal Palace last Saturday, and the March from the *Prophète*. The vocalists were Mdle. Levier and Mr. W. H. Cummings.

MR. KUHE's annual Musical Festival at Brighton is to commence on Tuesday next, and will be continued until the 22nd inst. The chief works announced for performance are: Bach's *Passion according to Matthew*, Costa's *Naaman*, Macfarren's *St. John the Baptist*, Gounod's *Gallia*, the *Creation*, the *Messiah*, Barnett's *Lay of the Last Minstrel*, Sullivan's "Overture di Ballo," and Benedict's overture to *The Tempest*. The list of soloists engaged is excellent; and the band and chorus will be complete in every department.

VERDI is said to be engaged upon a new opera, the subject of which is taken from Shakspeare's *King Lear*.

THE *Musikalisches Wochenblatt* announces that Offenbach is writing a mass, which is to be performed at a family festival. If the statement be correct, the work will doubtless be looked for with much curiosity.

DR. SLOMAN's Cantata, *Supplication and Praise* which was performed in June last at the Royal Albert Hall, London, will be shortly performed with orchestral accompaniments, by the Melbourne Choral Society, Derby.

SATURDAY, FEBRUARY 13, 1875.
No. 145, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.
It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Communitic Societies of the United States, from Personal Visit and Observation: including detailed accounts of the Economists, Zoarites, Shakers, the Amana, Oneida, Bethel, Aurora, Icarian, and other existing Societies, their Religious Creeds, Social Practices, Numbers, Industries, and Present Condition. By Charles Nordhoff, Author of 'Northern California, Oregon, and the Sandwich Islands;' 'California, for Health, Pleasure, and Residence,' &c., &c. With Illustrations. (London: John Murray, 1875.)

ANY portions of Mr. Nordhoff's subject are new to the English reader. Through Hepworth Dixon's works and others, peculiarities of the Shakers and Economists, of the Perfectionists of Oneida, are pretty well known to us already. The value of Mr. Nordhoff's volume consists in its more comprehensive scope, comprising, it would seem, all the communistic societies (outside Romish monachism) now existing in the United States; in the utter absence from its pages of sensationalism and pruriency; and in the interesting generalisations contained in the "Comparative View" with which the volume terminates.
It need hardly be said that the bodies to which Mr. Nordhoff's book refers represent communism in the older sense of the word, implying community of property, and not the political sense impressed upon it by the Paris "communards" as having reference to the organisation and independence of the commune. In the former sense, the term is applied to eight principal societies, all of which were personally visited by the author, and which comprise together seventy-two communes, besides two small bodies, very recently founded, which are described at second hand. There is also an account of a body which has ceased to exist in a communistic form, and of a few "colonies" which are not communistic. Of the eight chief societies, which contained in 1874 "about 600 persons" (Mr. Nordhoff's figures added give over 5,200), the oldest dates from 1794, the youngest from 1852, so that they present an experience of from twenty-two to eighty years.
Taking the subject within the limits needed by Mr. Nordhoff, it must be admitted that its importance lies rather in the future than in the present. 5,000 or 5,200 persons among the many millions in the United States are but a drop in the ocean. Of the eight chief societies, only two, the inspirationists at Amana, Iowa, and the Shakers, exceed 1,000, the former with 1,450

members, the latter with 2,415; so that these two bodies comprise together more than two-thirds of the whole number of communists in America. The eight societies own together from 150,000 to 180,000 acres of land, or thirty-six acres per head, "which is," says Mr. Nordhoff, "for this country, a comparatively small holding of land;" but it is "probably a low estimate" of their collective wealth to place it "at twelve millions of dollars," or "over 2,000 dollars per head, counting men, women, and children." And "it is not an exaggeration to say that almost the whole of this wealth has been created by the patient industry and strict economy and honesty of its owners, without a positive or eager desire on their part to accumulate riches, and without painful toil."

But the eight societies in question must be taken only as instances of "the survival of the fittest." Although the history of only one extinct commune is given, a list extracted from Mr. Noyes's *History of American Socialisms* shows that by 1870 there had been no fewer than forty-seven failures, no less than eighteen of which, it may be observed, testify by the title of "phalanxes" to the extraordinary seductiveness of the Fourierist doctrines. Moreover, none of the communities are stated to be increasing in numbers, except the Inspirationists or Eben-Ezers, and the Perfectionists. In some there is a marked falling off. The Economists have dwindled down to their present 110 from 750, which they were at starting; they are "most of them grey-haired," and seem evidently dying out. The Separatists, though more numerous than at first starting, were double their present number thirty-five years ago. The Shakers have "not in recent years increased," though they expect "large accessions in the course of the next few years." From this it would seem clear that the communes cannot be exercising an increasing influence upon the American people; and this is further shown by the fact that they are mainly composed of foreigners. "In origin the Icarians are French; the Shakers and Perfectionists Americans; the others are Germans; and these outnumber all the American communists." The Shakers themselves came from England; and thus it would appear that American Communism is really, with the sole exception of the Perfectionists, a product of the Old World and not of the New.

Hence, although Mr. Nordhoff's conclusions are, on the whole, extremely favourable to the communistic form of life—although he has "no doubt that the communists are the most long-lived of our population," tells us that they are "usually healthy," that "drunkenness is unknown in all the communes," that "the communist's life is full of devices for personal ease and comfort," that the people are "everywhere cheerful, merry in their quiet way, and with a sufficient number and variety of healthful interests in life;" that they are "all very cleanly;" that the "reputation for honesty and for always selling a good article is worth to the Shakers, the Amana and other communes, at least 10 per cent. over their competitors;" that they are "humane and charitable," and uniformly kind to their hired hands, so that it is a privilege to be employed by them, and

that even "the animals of a commune are always better lodged and more carefully attended to than is usual among its neighbours,"—it is clear that there is as yet for the bulk of mankind something repellent in the communistic life, which is sufficient to countervail all its advantages and attractions. That this something is neither the celibacy of the Shakers and Economists on the one hand, nor the distorted morality of the Perfectionists on the other, is clearly shown by the fact that communes where marriage is in honour, and no restriction is placed upon it, do not appear to increase more than the others.

Much of the newest matter in Mr. Nordhoff's book relates to the Inspirationists of Amana, the second most numerous among the societies examined, but which lives in Iowa in "rigorous seclusion," and entirely conceals itself and "its faith and plan from the general public." The members, all German, own about 25,000 acres of land, on which they live in seven small towns. They derive their name from their claiming to govern themselves by the inspiration of the Holy Ghost, speaking through "instruments;" holding the work of inspiration to have begun again in the later times about the end of the seventeenth and beginning of the eighteenth century. A leader of the name of Christian Metz, a carpenter, brought them over from Germany in 1842, and their present head is a woman, Barbara Heynemann, originally a poor Alsatian servant-maid, altogether untaught. Their "Rules for Daily Life" were drawn up by one of their earlier leaders, "an old mystic, E. L. Gruber." Here are a few out of twenty-one:—

1. To obey, without reasoning, God, and through God our superiors.
2. To study quiet, or serenity, within and without.
3. Within, to rule and master your thoughts.
4. Without, to avoid all unnecessary words, and still to study silence and quiet.
7. Do not disturb your serenity or peace of mind—hence neither desire nor grieve.
13. Fly from the society of womankind as much as possible, as a very highly dangerous magnet and magical fire.

Another very interesting account, outside of the author's regular subject, is that of a non-communistic undertaking, the colony of Vineland, in New Jersey, established by a "long-headed, kind-hearted man," Mr. Charles K. Landis, in a region called "the Barrens," the light soil of which was supposed to be "unfit for profitable agriculture," but upon which, by means of certain simple rules and the exercise of judicious forethought, he managed to gather in twelve years, upon a tract which had "not a single inhabitant in 1861," about 11,000 people, who have built "twenty fine school-houses, ten churches," and kept up 178 miles of road; the poor-tax in Vineland township amounting to about five cents for each inhabitant per annum, and police expenses to about one-half cent, while these two items in another township of the same state amount to two dollars per head.

Mr. Nordhoff's introduction is disfigured by a violent and uncalled-for attack on

trade-unions, which in fact only shows his ignorance of the subject. He will perhaps be surprised not only to hear that co-operative views are very largely entertained by men who are also the most devoted of trade unionists—that co-operative bodies have been in several instances established, and in some instances successfully carried on, by trade-unions—but that some of their leaders have been trained in those communistic views which he seems to consider purely antagonistic to trade-unionism; and I feel certain that, if he will take the trouble to investigate the macrocosm of trade-unionism with anything like the personal care and thoughtful impartiality with which he has investigated the microcosm of Communism, the results of his enquiries will be at least as favourable to the former as to the latter.

One word also in vindication of a man now dead, of whom Mr. Nordhoff speaks with a harshness strangely contrasting with the tenderness with which he treats a personage like Mr. Noyes, of "complex marriage" notoriety. Etienne Cabet was no "vain dreamer," without "grim patience" or "steadfast unselfishness." He was a dreamer, but the influence he exercised was precisely owing to his "steadfast unselfishness." The least talented of all Socialist leaders of our day—not eloquent either with tongue or pen—it is by sheer weight and simplicity of character, conjoined with faith in his *Icaria*, that he drew French working-men to him, never sparing their vices or their follies, always inculcating the strictest morality; a man of so high a courage that, when he had in his absence (according to the atrocious French criminal system) been convicted on a charge of fraud, he came back to France as soon as he had settled his colony, in the darkest days of the Napoleon régime, for the sole purpose of submitting to a second trial, and with a full expectation of being sentenced, on the strength of his name, to several years of imprisonment. A friend of mine, who has since won a high place in literature, saw him on this occasion during his passage through England, and declared that "the old Frenchman of sixty-five" might fairly stand beside Regulus. As it happened, he was fully acquitted; but considering what French courts of justice are, and especially what they were then, the act was simply heroic.

And finally, to turn to quite a different subject, why, when Mr. Nordhoff appends to his work a bibliography, could he not render his readers the further service of putting some order into it, whether chronological or alphabetical? Even different editions of what appears to be the same work are separated, whilst one entry occurs twice over; compare, for instance, Nos. 2, 45, 46, and 47, or again 21 and 40. Mr. Nordhoff should have employed a Shaker to draw up his bibliography.

J. M. LUDLOW.

Assyrian Discoveries. By George Smith. (London: Sampson Low & Co., 1875.)

MR. SMITH'S book is one of great interest for the scholar as well as for the general public, and it can be heartily recommended to both classes of readers. The new ma-

terials he has furnished for the reconstruction of the history of the past will not be more acceptable to the one than the record of travels and explorations among the ruins of an ancient empire to the other. Indeed, many of the inscriptions, translations of which form the second half of the volume, are likely to awaken a keen interest in others besides professed students, not only on account of their theological bearings, but yet more of their intrinsic merits.

It will be remembered that Mr. Smith's discovery of the native Chaldean account of the Flood induced the proprietors of the *Daily Telegraph*, with a munificence worthy of imitation, to send him to the site of Nineveh to search among its buried libraries for the missing fragments of the tablets which narrated the story of the Deluge. The expedition was successful, and the present volume contains the first translation yet made of the whole text of this remarkable document. While waiting for the Sultan's firman to authorise his excavations, Mr. Smith floated down the Tigris from Mosul to Bagdad, stopping on his way to examine the mound of Kalah Sherghat, the ancient Aashur or Ellasar, and visited some of the most famous sites of Babylonia. When at last the firman arrived, "I left," he says, "this part of the country with regret, as I was far more desirous of excavating here than in Assyria. Babylonia is the older and richer country, and is a field not worked nearly so much as Assyria;" words which every Assyrian student will echo. Work was begun as soon as possible at Nimrud, Nebbi Yunus, and Kouyunjik, the ancient Calah and Nineveh; and on May 14 the traveller had the satisfaction of finding the clay fragment which exactly fitted into the vacant places of the Deluge-tablets. His satisfaction, however, was not an unmixed one, as the proprietors of the *Daily Telegraph*, considering the object of the expedition to be accomplished, and that the work they had begun ought to be taken up by the nation, now summoned him home. After continuing the search for antiquities up to the last moment before departure, he closed his trenches, and quitted Mosul on June 9, arriving in England the following month. He had to leave his antiquities behind him, however, as the Turkish officials, with a duplicity and obstructiveness from which Mr. Smith had often to suffer, detained them in the custom-house at Alexandria, from which they were only released by the exertions of the British consul, Mr. Franck. The constant trouble that the explorer experienced from the representatives of a Power which we once aided at the expense of so much life and treasure is a matter for astonishment and regret.

The Trustees of the British Museum determined to send Mr. Smith on a second expedition to Nineveh before the expiration of the firman, in order that the fragmentary inscriptions in the Museum might be still further supplemented and completed by an exploration of the Library of Sennacherib at Kouyunjik. He accordingly entered Mosul a second time on January 1, 1874, but the annoyances he encountered on this occasion from the authorities of the Turkish government, whose archaeological cupidity had

been aroused by Dr. Schliemann's discovery of gold ornaments at Hissarlik, embittered his stay, and seriously interfered with his excavations. Much, however, was found, and in spite of another seizure of the antiquities near Aleppo, Mr. Smith and his treasures succeeded in reaching England in safety.

The account of his journeyings and adventures, his discoveries and difficulties, is told with unaffected simplicity, and some of the passages of the book remind one of the charming freshness of early travellers. It is prefaced by a brief history of cuneiform decipherment, and a list of the chief works upon the subject, among which, however, we miss any notice of Mr. Smith's own publications. But the main characteristic of the volume, which will give it an abiding value, is the translations of the most important and interesting of the inscriptions he has found. For the first time the palaces of ancient Nineveh were investigated by one who knew what to look for and what to pass by, and who was able at once to appreciate, as few else can, the importance of the relics he unearthed. Foremost among translated inscriptions comes a fairly complete text of the Deluge-tablet, together with other portions of the "Izdubar" series of legends, the oldest epic of which we know. I find myself, however, unable to agree with Mr. Smith's conclusion that the theory started by Sir H. Rawlinson that these legends describe the passage of the sun through the Zodiac "is contradicted by their plain narrative;" it seems to me, on the contrary, that the additional matter supplied by Mr. Smith furnishes further proof of the theory in question. Thus the sixth tablet records the love and vengeance of Ishtar, corresponding to the name of the sixth Zodiacal sign, while the ninth month of "clouds" and the tenth month "of the eastern sea" answer to the visit of "Izdubar" to cloudland, where the giants, like Atlas, "guard the rising sun, their crown at the lattice of heaven, under hell their feet," and his journey to the sea to seek Sisnithrus. Next in point of interest to these old legends are the tablets which contain hymns to the gods, instructions to rulers, and astronomical details; but the chronologist and historian will find plenty to attract them in the large mass of new or supplementary data which Mr. Smith has brought home. An ancient Babylonian inscription throws light on the early condition of that country, a new text of Sargon's refers to his conquest of Judaea in the fourteenth year of Hezekiah, which has been mixed up by the Jewish writers with the campaign of Sennacherib ten years later, and the fragmentary annals of Tiglath-Pileser, so important to the Biblical student, are for the first time given in full. Tablets from Babylon, again, fix the date of the revolt of Arsakes from the Seleukidae and the foundation of the Parthian monarchy, and thus settle what has long been a disputed question of chronology.

Besides his strictly "Assyriological" discoveries, Mr. Smith came across much else of considerable interest. To say nothing of bilingual inscriptions in Assyrian and Phoenician, or of the famous Bagdad lion, one of the few remains of the Hyksos in Egypt, he saw at Aleppo a new inscription written in

the so-called Hamath hieroglyphics, and found in the palace of Assur-bani-pal at Kouyunjik several objects from Kyprus, one of them stamped with three Kypriote characters. The existence of this curious syllabary in the seventh century B.C. is thus proved, and may be recommended to the notice of those who are at present engaged upon the subject.

Where there is so much fresh material and healthy narrative appealing to different classes of readers, it is impossible to pick out special passages for quotation without exceeding the limits of a review. The reader may put perfect confidence in the statements of the author. Every Cuneiform scholar will guarantee the substantial accuracy of Mr. Smith's translations, while his extraordinary skill as a decipherer is too well known to need remark. He is distinguished, too, by common sense and care not to go beyond his facts. Once or twice, however, he has forgotten his wonted caution, as when he says that Nineveh was built by Nimrod, or that the god Sukamuna was a Babylonian king. The Babylonian royal family, indeed, traced its descent from Sukamuna, just as Hekataeus counted a deity among his ancestors, but it never transformed Sukamuna into an earthly monarch. A similar disregard of the boundary between the mythical and the historical has led him also to claim a place for "Izdubar" among the personages of history. This is the more to be regretted, as Assyriologists have already incurred the just suspicions of historians and critics by the readiness of their historical belief. The "Niebuhrian method" has yet to be applied to the study of the Assyrian inscriptions. Apart from these microscopic blemishes, however, Mr. Smith's book is a thoroughly good one, simple and straightforward and, in fact, just what it professes to be. It is emphatically a record of discoveries, and at the same time a monument of patient perseverance and conquest over difficulties.

A. H. SAYCE.

MAURER'S HISTORY OF ICELAND.

Iceland von seiner ersten Entdeckung bis zum Untergange des Freistaats. Von Konrad Maurer. (München.)

It is strange enough that not from any of the scholars of Scandinavia, but from a German, we receive the first really important contribution to Icelandic history produced since, and in consequence of, the Thousand-Years' Feast. The learned author states in his preface that he has even hurried his work somewhat that it might be published at the very time of the Jubilee, in order to prove to his Icelandic friends that though circumstances prevented him from being personally present, he was still in full sympathy with them in the moment of their triumph, and to show the German world of readers what a unique place in the history of culture has been held by the inhabitants of the remote and barren island to which Denmark has just granted a long-wished-for Constitution. So delicate a compliment as this cannot fail to delight the Icelandic people, who will ask, and not without ground, why it did not occur to any of the great scholars of Norway or Denmark to exert themselves in a similar

way, and so to save their countrymen from the extraordinary indifference and ignorance that they show in all matters concerning the island to which they owe so much.

It was not until the end of the eighth century that Iceland first became known. Its earliest discoverers and visitors were the Celts, who were at that time in undisputed possession of the islands on the north and west coasts of Scotland, and the few anchorites who had already ventured as far as Shetland and the Faroe Islands, and who now, in search of penitential solitude, fled further still from the haunts of man. An Irish monk, Dicuilus, in a work written in the year 825, describes a visit a friend of his had made thirty years previously to an island far north of Scotland, which he considered to be the Thule mentioned by Pliny and others. It was not, however, until seventy years later still that Iceland was discovered by the Northmen. A Norwegian viking, Naddoör by name, sailed thither, and called it Snæland, because it was covered with snow. Slightly later a Swede, Garðar Svavarson, circumnavigated Iceland, and named it Garðarsholmr, after himself. Its present title is owing to the third Northman who visited it, a Norwegian, Flóki Vilgerðarson; his exploration is considered to have taken place about the year 870, and from this moment an enormous emigration to Iceland from the mainland of Scandinavia took place, the main stream of which, headed by Ingólfr Arnarson, reached it in 874, and it was the anniversary of the landing of the colonists close to the spot at present occupied by the capital of Iceland—Reykjavik—that has just been so joyously celebrated. After a brief account of this stream of emigration, and its causes, the author proceeds to discuss the nature of the island itself, its climate and resources, in those early days, and then the nature and qualities of the remarkable race that took possession of it. It will be remembered that the main cause of so many of the very best families in Norway leaving their fatherland was the impossibility of bearing the tyranny of Harald Fairhair, when he made himself King of all Norway, so that the Jubilee of Norwegian Unification in 1872 was the natural precursor and forerunner of the Icelandic Jubilee of 1874.

Professor Maurer then starts upon the main theme of his book, the history of the Icelandic Republic. He sketches the chaotic condition in which the settlers first found themselves plunged; the sudden determination in self-defence to create laws and a civilised political constitution, and then the inestimable benefit which accrued to the infant state from the possession of a great legal genius in Úlfljótt, whose laws became the basis of the Icelandic Commonwealth. He then passes to the introduction of Christianity, and traces the progress of the new religion as far as the foundation of the bishopric of Skálholt, and the full establishment of the Icelandic church. In due course he passes to the consideration of the fall of the Republic. The golden age of Icelandic freedom lies between the beginning of the eleventh and the end of the twelfth centuries. All the chaotic elements that had troubled the earlier settlers were completely at rest;

arts and sciences were flourishing, and the national literature was at the full blossom of its best period. Professor Maurer, in answering the natural question, how it was that this brilliant period came so rapidly to an end, attributes its decline mainly to internal reasons, to the unique conditions of the communities called "goðorð," the chiefs of which held priestly power in pre-Christian times, and till the end of the Commonwealth retained a large share in the national government, and also to the no less unique relation of the Church to the State. The rivalry between the goðar and the priests created an ecclesiastical opposition that gravitated towards Norway. It is to the eternal disgrace of the great poet and historian, Snorri Sturluson, perhaps the first imaginative genius that Iceland has produced, that it was through his active intervention that the Republic ultimately fell, and that Iceland passed into the hands of Hákon, King of Norway.

The second division of Professor Maurer's work is no less able and weighty, but deals with matters of less general interest. First he discusses the internal construction of the Icelandic Commonwealth, its civil and criminal laws, its parliamentary constitution, its development and gradual perfection, and finally its division and decay. He then passes to the church, analysing in full its organisation, its oscillation between the archiepiscopal sees of Bremen-Hamburg and Lund, the creation of a bishopric of Skálholt and later on of Hólar, and of the peculiar nature of the jurisdiction of the bishops. He then gives a minute description of the priestly order, and of the functions and privileges of its members; describes the cloister-life as we know it from the early Christian literature, and finally draws a sketch of the ecclesiastical life generally in Iceland during the later years of the Commonwealth.

It would be impossible in these columns to follow the distinguished Professor through all the divisions of his subject. He says himself that had he worked out to the full the treasures of Icelandic history and law that thirty years of indefatigable study have gathered around him, not one volume, but thirty would be needed to present only an analysis of the whole. One cannot, however, but admire the consummate skill with which the present volume has been put together. In every page one is conscious that one listens to a teacher who speaks with authority, and though it is in some respects a book of a popular nature, there is also conspicuous everywhere the sensitive and scrupulous hand of a writer who will not hazard the smallest dictum without being certain of his authorities. More than this one dare not say. A man must be profoundly learned or ridiculously arrogant who would venture to praise such a scholar as Konrad Maurer!

EDMUND W. GOSSE.

SIGNOR GINO CAPPONI'S *Storia della Repubblica di Firenze* has been received with such favour in Florence that a subscription is already on foot for the purpose of erecting a bust of the author. The Italian papers announce the speedy appearance of the letters of Alessandro Manzoni, collected and edited by Giovanni Sforza (Pisa).

The Natural History and Antiquities of Selborne. By the Rev. Gilbert White, M.A. Thoroughly revised, with additional Notes, by James Edmund Harting, F.L.S., F.Z.S. (London: Bickers & Son, 1875.)

To Gilbert White is due the credit of having been the first to render natural history a popular and attractive study, nor is it easy to over-estimate the debt which science owes to his most delightful letters. Of them it may be truly said that "they are not dead things, but do contain a progeny of life in them, to be active as that soul whose progeny they are." They have probably made as many naturalists as Robinson Crusoe has made sailors, and, in spite of our advance in knowledge, they neither are nor are likely to become at all out of date. Their style alone would preserve them, even if they contained far worse heresies than those which their author held on the hibernation of swallows or the origin of honey-dew. No matter whether he is detailing with scientific precision his observations on the habits of some familiar insect, or recounting with boyish enthusiasm the acquisition of some new specimen, he is always alike delightful. He talks of "my bat" or of "my newly-discovered migrators" as though they were members of his family or his welcome guests; and, mingled with acute remarks, there are constantly to be found little playful touches, reminding us of Charles Lamb and suggesting how the Londoner might have written had he been trained in the country and a dweller in Selborne. Take, for instance, the following account of "the old family tortoise":—

"Because we call this creature an abject reptile, we are too apt to undervalue his abilities and depreciate his powers of instinct. Yet he is, as Mr. Pope says of his lord,

'Much too wise to walk into a well;'

and has so much discernment as not to fall down a haha; but to stop and withdraw from the brink with the readiest precaution. Though he loves warm weather, he avoids the hot sun; because his thick shell, when once heated, would, as the poet says of solid armour, 'scald with safety.' He therefore spends the more sultry hours under the umbrella of a large cabbage leaf, or amid the waving forests of an asparagus bed. But as he avoids heat in the summer, so, in the decline of the year, he improves the faint autumnal beams, by getting within the reflection of a fruit-wall; and, though he never has read that planes inclining to the horizon receive a greater share of warmth, he inclines his shell by tilting it against the wall, to collect and admit every feeble ray."

The same spirit of research which Gilbert White displayed in collecting the facts of Natural History, rendered him a most competent antiquary. And, we may add, the Antiquities of Selborne, beside being a valuable contribution to topographical literature, form a model of parochial history not beyond the power of many a country clergyman to imitate. Hampshire is still without any county history worthy of the name; are there no successors of White within its limits able to supply the want?

Mr. Harting has edited the letters relating to Natural History in a very judicious way. He has not overwhelmed the text with notes, as his predecessor, Mr. Bennett, did; nor has he passed over unnoticed the errors in White's conclusions which subsequent re-

search has detected. He knows Selborne and its neighbourhood well, and ornithology has been with him, as with White, a favourite study. Thus he is able to tell us that black game, which "abounded much before shooting flying became so common," though thought to have been exterminated, have yet maintained their ground, and are now to be seen in not inconsiderable numbers; the curl-bunting and the garden warbler, which were either unknown to Gilbert White or were overlooked by him, have since been met with in Selborne; and the land-rail and teal are no longer rare, but frequent visitants to the neighbourhood. On the other hand, the red-deer, which once roamed the Forest of Wolmer, have long become extinct. The honey-buzzard has deserted Selborne Hanger, and the raven has now ceased to breed on Blackmoor. The flora of the neighbourhood has undergone still further changes, and although White might be grieved to know that Bin's Pond had been drained, and that cattle now graze where wild ducks and snipe used to find shelter, he would rejoice that Wolmer Forest, which eighty years ago was "without one standing tree on the whole extent," is now partly enclosed, and planted with oak, larch, and Scotch fir.

We cannot say that the illustrations of the present edition are much to our taste. Some of Bewick's woodcuts exhibit his characteristic vigour and accuracy, but the rest are poor specimens of art, and contrast unfavourably with the engravings by C. T. Thompson, which add so greatly to the beauty and value of Mr. Yarrell's works, and with those which have increased the popularity of Mr. J. G. Wood's well-known volumes.

CHARLES J. ROBINSON.

Le Chancelier Pierre Séguier, Second Protecteur de l'Académie Française. Par René Kerviler. (Paris: Didier & Cie., 1874.)

AMONG the biographies in which French literature is so prolific, it is singular that not one has been before written of the Chancellor Séguier, one of the most remarkable characters of the seventeenth century. The favourite of Cardinal Richelieu, he had often the courage to oppose him; a zealous royalist, an energetic magistrate, and a patron of letters, he was appointed Chancellor at the age of forty-seven, and held the seals, with some short interval, for thirty-seven years. During his tenure of office, the charge of three memorable trials devolved upon him—those of the Queen, Cinqu-Mars, and Fouquet—all undoubtedly criminal, but whom posterity has thought fit to pity, while it has loaded with obloquy him whose office rendered him their compulsory accuser.

The new Chancellor began his career with the affair of the Val-de-Grâce. Anne of Austria was accused of maintaining a secret correspondence with her brother, the King of Spain, contrary to the interests of her adopted country. The Chancellor was ordered to visit Val-de-Grâce to search for papers, and afterwards to interrogate the Queen and her valet, La Porte, the bearer of intercepted letters. So far from pursuing the affair with severity, Séguier, animated

by compassion for a neglected wife, without support or counsel, and anxious to shield her from the vengeance of the Cardinal, and to avoid the scandal of exposing the culpability of one of so exalted rank, is supposed to have privately given information of the intended domiciliary visit to the abbess of the convent, so that when Séguier and the Archbishop of Paris arrived to seize the papers, nothing was found to compromise the Queen. When afterwards interrogated by the Chancellor, Anne acknowledged the intercepted letters (which are now in the National Library), but neither fear of the question nor of the terrors of the Bastille could elicit anything from La Porte, for he was well prepared. Faithful friends had made known to him to what extent the Queen had confessed. The manner in which the information had been conveyed savours more of the romance of fiction than of the truth of history, but it is so related in his memoirs:—

"Le chevalier de Jars, qui venait d'échapper à l'échafaud, était aussi prisonnier à quatre étages au-dessus de La Porte. Mlle. de Hautefort vint le voir déguisée en soubrette, et lui remit l'état exact des aveux de la reine; de Jars perça son plancher, passa l'avis au prisonnier de l'étage inférieur, qui en fit autant, et d'étage en étage la lettre parvint au valet de chambre de la reine. Il n'y avait plus à hésiter. Dès lors, comme épouvanté devant l'appareil de la question, il fit exactement le même aveu que la reine, ce qui n'était pas trop compromettant. Le cardinal fut confondu, et la paix signée entre Anne et Louis XIII., qui n'avait pas trouvé dans ces papiers la conspiration épouvantable dont l'avait menacé Richelieu."

In all this affair Séguier appeared in an odious light in the eyes of the public, who accused him of servile compliance to the Cardinal, but it is evident the Queen thought differently, and showed him, throughout her life, the most lively gratitude for his timely warning.

Again, in the trial of Cinqu-Mars, Séguier did his utmost to moderate the violence of Richelieu. He would not allow Gaston of Orleans to be confronted with the accused, declaring the jurisprudence of the kingdom did not allow such an indignity to be inflicted upon a "fils de France;" and when Cinqu-Mars had made a full confession of his crime, and had been sentenced with De Thou to be beheaded—the one for the conspiracy he had made, the other for having known it and not discovered it—Séguier did all in his power to save the young De Thou, and would probably have succeeded had not an adherent of Richelieu brought forward an ordinance of Louis XI. which declared that he who had the knowledge of a conspiracy and did not reveal it, was subject to the same penalties as the author himself.

The death of the Cardinal three months after these executions was soon followed by that of the King. His will was set aside, and Anne of Austria declared sole regent of the kingdom. The Chancellor remained in office, and during this, the second period of his public life, Séguier showed his distinctive characteristic—an absolute and obstinate devotion to the royal authority. He persuaded the Queen to remain firm in her conflict with the Parliament, contrary to the advice of Mazarin, who desired to yield. The disturbances of Paris were soon taking the

rm of a civil war, and Mazarin, to pacify e Fronde, deprived Séguier of the chancellorship. He supported his disgrace with gnity, being sure that the Queen had only sented to his dismissal from reasons of ate. He retired to Rosny, having been me weeks previously elevated to the gnity of duke and peer, and passed his me in the pursuits of literature and with ie members of the French Academy. Proudly learned himself, and speaking with egance and facility, Séguier delighted in tters and the society of literary men. His rrespondence forms forty-four volumes in ie National Library. His collection of books as his chief amusement. In his letters to is librarian Blaize, during his retreat at osny, he styles his library his "bien mée." He writes: "Je vous recommande 'avoir soing de ma bien aymée, je veux ire ma bibliothèque, c'est ma passion." nd again: "Vous devrés prendre pour arque de l'assurance que j'ay de vostre ertu, la confiance que j'ay en la garde de ce ue j'ayme le mieux." And once more, not to ultiplied quotations: "Monsieur Blaize, je ne oubte point du soing que vous avés de ma ibliothèque; mais un amoureux a toujours e l'inquiétude pour ce qu'il chérit. Je ne ie suis pas mortifié jusques à ce point que e quitter l'affection de mes livres, elle ugmente par l'absence."

In 1656, Séguier was recalled a third ime from his peaceful retirement to take he seals. The French Academy, through ellisson, made him a congratulatory address n the occasion.

In 1661, Cardinal Mazarin died, leaving he King his universal heir. Louis, now ly twenty-three years of age, was at the ighest point of his prosperity. The peace f the Pyrenees had made him the arbiter f Europe, and he works during this eriod of peace at the internal organisation f his kingdom. He assembles his ministers, nd announces to them that he has called hem together to tell them that though itherto he had left the government of ffairs to the Cardinal, he now intends to ule alone, and they will assist him with heir advice when "he asks for it." The ninisters soon found they had a master.

The death of Mazarin made no difference in he position of Séguier. Louis XIV. knew and appreciated his merits. The trial of Fouquet which now devolved upon him was just and necessary. The history of his arrest has been too often told in history and in romance to need repetition. Colbert had in his hands the proofs of Fouquet's financial malversations. Séguier took an active part in the proceedings, though he was now seventy-five years old, and the infirmities of age were fast creeping upon him. Fouquet's life was spared, but he was condemned by the King to a rigorous imprisonment for the rest of his life in the fortress of Pignerol.

Colbert now occupied himself in the re-orm of all the branches of administration, —finance, police, commerce, manufactures, justice, &c.—which marked a new era in the internal organisation of France. He re-instituted the ancient Chamber of Commerce, desiring, as he said, "to place the kingdom in a condition to dispense with having re-ourse to foreigners for things necessary for

use in France." In all these counsels, Séguier took his share, but especially in the conferences relating to the reformation of justice. In drawing up the famous ordinance of 1669-70, known under the name of the "Code Louis," which was the basis of public right in France for 130 years, Séguier, though in declining health, took an active part. The publication of the criminal ordinances, in which were observable the same order, simplicity, and unity as in the civil code, was the last important act of his long ministerial career. He died, January 1672, at the age of eighty-four, "avec beaucoup de piété et de connoissance." His seals of office had been previously delivered to the king, who held them in person till April 18, when Aligre was appointed Chancellor. Louis also desired to succeed Séguier as protector of the French Academy, whose sittings were transferred from the Hôtel Séguier to the Louvre.

Such was the career of the most illustrious of the Séguier family. M. Kerviler has well acquitted himself of his task, and Séguier appears in a totally different light from that in which he is represented by his vindictive contemporaries. M. Kerviler shows us the causes of the animosity against him. In becoming the servant of the Crown, he devoted himself entirely to the maintenance of royal authority, and he attached himself to Richelieu and Mazarin because these two ministers appeared to him to have best understood the principle. As he says, in conclusion:—

"Nous n'avons pas caché les faiblesses du chancelier, mais comment ne pas le pardonner en songeant que ses adversaires eux-mêmes n'ont pu s'empêcher de manifester leur étonnement et leur admiration en apprenant que quarante années de ministère ne l'avaient point enrichi? Tous, amis et ennemis, rendent un hommage éclatant à sa vaste érudition, à sa prudence dans le cabinet, à sa connaissance approfondie de toutes les affaires publiques, à son éloquence au pied du trône. Son nom se trouve malheureusement attaché à l'histoire de trois procès célèbres, dont les coupables ont réussi à exciter la pitié de la postérité; mais ni l'abandon de la reine, ni la jeunesse de Cinq-Mars, ni les élégies de La Fontaine, les plaidoyers de l'ellisson, et les lettres de M^{me}. de Sévigné en faveur du troisième, ne peuvent absoudre les crimes d'Etat, les projets d'assassinat, ou la dilapidation des deniers publics dont ils furent convaincus."

To this may be added that Séguier had the rare merit of being true to his party. He never sought personal aggrandisement when the opportunity was before him of attaining the first post in the kingdom, but remained a faithful subject, a devoted servant of the Crown, in the midst of temptations to which most men would have yielded. Voltaire, La Bruyère, and Mascaron have all paid their tribute to his merits. In the midst of the turmoil of political life he protected the learned of all professions, and the title of Mæcenas has never been given to a more eminent patron of arts, science, and letters than the Chancellor Pierre Séguier.

F. BURY PALLISER.

DR. INGLEBY is preparing a third edition of his *Still Lion*, a diatribe against Shakspeare emendators, with explanations and justifications of readings that have been supposed to be corrupt.

The Last Journals of David Livingstone, in Central Africa, from 1865 until his Death. Continued by a Narrative of his Last Moments and Sufferings obtained from his faithful Servants Chuma and Susi. By Horace Waller, F.R.G.S., Rector of Tugwell, Northampton. In Two Volumes. With Portrait, Maps, and Illustrations. (London: John Murray, 1874.)

THESE Journals are the best work that we have ever had from Livingstone's pen, but it is impossible to condemn too severely the careless, vulgar, and ignorant way in which Mr. Waller has edited them. Nothing can exceed the bad taste of his preface, and of the remarks, within brackets, which he constantly obtrudes between the paragraphs of Livingstone's diary. His habitual reference to Dr. Livingstone as "the Doctor" is, perhaps, a sufficient sign of the mental condition in which Mr. Waller set himself to the task he has so incompetently discharged. His principal offence is an utter want of delicacy, and of reverence for Livingstone's memory, in publishing the many ejaculations of fervent piety and the simple touching prayers scattered throughout Livingstone's diaries. It must be borne in mind that Livingstone never meant his diaries to be seen in their original form by any eyes but his own, or, in the event of his death, by his children. He always hoped to edit them himself, as he had done his *Missionary Travels*; and Mr. Waller, in preparing the diaries for the press, should have asked himself whether Livingstone, had he lived, would have published these hallowed utterances of the deepest feelings of his nature when alone with his work in the hidden heart of Africa. Livingstone's answer is given in vol. ii. p. 156 of the *Last Journals*, where, with reference to his timely deliverance by Stanley at Ujiji in 1871, he writes:—

"I am not of a demonstrative turn—as cold, indeed, as we islanders are usually reputed to be—but this disinterested kindness of Mr. Bennett, so nobly carried into effect by Mr. Stanley, was really overwhelming. I really do feel very grateful, but at the same time a little ashamed of not being more worthy of the generosity."

Livingstone's whole manner before his fellow-men was the outward and visible expression of the thought and feeling manifested in this passage, and the publication of his straightforward, guileless prayers by Mr. Waller is a really unpardonable outrage. They were, indeed, "stones of help"—"Ebenezers"—which Livingstone "set up by the way," through his diaries; and had he lived to edit them, when he came to these "memorials," they would have recalled the awe and hope and sense of blessing which inspired them; and he would have probably given enlarged expression to them as a man writing for men: but he never would have published them as they were uttered.

These journals are a most interesting and invaluable contribution towards our knowledge of Inner Africa. They form an almost unbroken record of Livingstone's seven years' wanderings in the interior of the continent from the date of his leaving the coast on April 7, 1866, to his death on

the southern margin of Lake Bangweolo, in Ilala of the Wabisa, on May Day, 1873. His first entry, indeed, is dated at Zanzibar, January 28, 1866, and the last on April 27, 1873. The first part of his journey, from the sea to Lake Nyassa, occupied four months, from April to August, 1866. From Nyassa he laid his course across the Chambezé for Lake Tanganyika, the southern end of which he reached April 1, 1867. Leaving the lake, he struck due west to Lake Moero, formed by the Lualaba, and thence southwards to Lake Bangweolo, formed by the Chambezé, from which the Lualaba issues, and which he discovered July 18, 1868. Altogether Livingstone was engaged for nearly two years—from January, 1867, to October, 1868—in exploring the basin of the Chambezé and Lualaba, and lakes Moero and Bangweolo. Returning during the autumn of 1868 and beginning of 1869 to Lake Tanganyika and Ujiji, he again, in July, 1869, struck off westward to explore the Manyema country, and after twenty-seven months' wanderings returned to Ujiji, where he was discovered in his distress and exhaustion by Stanley, on October 28, 1871. He took Stanley on a sort of pleasure excursion to the head of Lake Tanganyika, and accompanied him on his return to the coast as far as Unyanyembe, from whence, in spite of all Stanley's entreaties, after receiving fresh supplies from Zanzibar, he set off on his ill-fated second expedition to Lake Bangweolo on August 25, 1872, and there eight months later he died. The geographical results of these seven trying years are of the utmost importance. Livingstone's last march from the coast to Lake Nyassa was by a route entirely new to Europeans, although commonly used by the Arabs. He was practically the discoverer of lakes Moero and Bangweolo, although the basin of the Chambezé and the Lualaba had repeatedly been traversed by the Portuguese before him. Until he explored it the Manyema country was utterly unknown to scientific geography; and his persevering examination of the Tanganyika lake completes our knowledge of it, corroborating the discoveries of Burton and Speke, while his own discoveries have been confirmed by the recent scientific survey of its intricate shores by Lieutenant Cameron.

Unfortunately it is in the exposition of the scientific results of Livingstone's expedition that Mr. Waller most conspicuously fails. He throws no light on the objects which Livingstone had in view in undertaking the expedition; or on the considerations which directed his different excursions. He makes no attempt to harmonise his discoveries with those of other travellers, or to point out where Livingstone had been anticipated by others, and where a discovery is entirely his own. And worst of all, where Livingstone has unwittingly done palpable injustice, as in his criticism on Mr. Cooley's account of the hydrography of the Chambezé, Mr. Waller has simply cast an insult at the victim of Livingstone's inadvertence, and passed on. He has virtually left Livingstone's notes just as he found them—a jungle without sign-post or tracks, more bewildering to the general reader than the wilds and desolate wastes through which Livingstone

himself passed. As examples of Mr. Waller's usual commentary on Dr. Livingstone's text, the following quotations are made at random:—

"We see the thread by which he still draws back, a word or two from Stanley has not yet parted." (Vol. ii. p. 175.)

"His keen enjoyment in noticing the habits of animals and birds serves a good purpose while waiting wearily and listening to disputed rumours concerning the Zanzibar porters. The little orphan birds seem to get on somehow or other; perhaps the Englishman's eye was no bad protection, and his pity towards the fledglings was a good lesson, we will hope, to the children around the Tembé at Kwihara." (p. 198.)

"Geologists will be glad to find that the Doctor took pains to arrange his observations at this time in the following form." (p. 215.)

The objects of Dr. Livingstone's last expedition, and the principles which guided him throughout it, have been fully stated by him in numerous private letters written when staying in Bombay in the spring of 1866. They are also stated in a lecture which he gave before the Bombay branch of the Royal Asiatic Society, and in his correspondence with myself as Honorary Secretary of the Society. This letter and one of his letters to me are published at length in volume viii. of the Journal of the Society, pp. 91–116 of the *Proceedings*. In volume xv. of the *Transactions of the Bombay Geographical Society*, Mr. Waller would have also found the "Narrative of Said Bin Habeeb, an Arab Inhabitant of Zanzibar," who is several times mentioned in Livingstone's Journals. This "narrative" would have suggested some interesting comments to Mr. Waller.

In vol. ii. p. 282, Livingstone's remark that "no traces seem to exist of Captain Singleton's march" has excited some criticism. Livingstone knew perfectly, as Mr. Waller has pointed out in a foot-note, that Singleton was only a character of fiction. In 1863 I read a paper before the Asiatic Society in Bombay "On Recent Discovery in Eastern Africa, and the Adventures of Captain Singleton," and Livingstone was singularly impressed with my idea that De Foe had taken the story of this African journey from one who had actually made it. He evidently had the copy of my paper with him in Africa, as the whole page 338 of the first volume of these Journals is apparently written directly from it. His suggestion that Moses had been in Central Africa was also, if I remember rightly, started in Bombay. The time Dr. Livingstone spent there was one of the happiest periods of his life. He was received by the Governor, Sir Bartle Frere, and Mr. W. E. Frere, and the Rev. Dr. John Wilson, with an unbounded welcome, and was thoroughly set up for his expedition. He was in the highest spirits during the whole time of his visit, and started some new idea every day that haply he might find amongst them some inspiring theory to work his way by. And it may be as well to mention here that the 6,500 rupees contributed to his expedition by the Bombay Asiatic Society had been increased to nearly 11,000 rupees when made over to his family last year.

It is difficult to make any quotations of general interest from a mass of detached notes such as these volumes present. In

volume ii.—by far the more entertaining of the two—Livingstone describes the flowers of the Babisa country, pp. 264–265:—

"There are many flowers in the forest—marigolds, a white jonquil-looking flower without smell; many orchids; white, yellow, and pink *Asclepias*; clematis, *Methonica superba* (*Gloriosa superba*), gladiolus, and blue and deep purple polygalas, grasses with white starry seed-vessels, and spikelets of brownish red and yellow. Besides these, there are beautiful blue-flowering bulbs, and new flowers of pretty delicate form and but little scent. To this last may be added balsams, compositae of blood-red colour and of purple; other flowers of liver colour, bright canary yellow, pink orchids on spikes thickly covered all round, and of three inches in length; spiderworts of fine blue, or yellow, or even pink. Different coloured *asclepiads*; beautiful yellow and red and umbelliferous flowering plants; dill and wild parsnips; pretty flowering aloes, yellow and red in one whorl of blossoms, peas, and many other flowering plants, which I do not know. Very few birds or any kind of game. The people are Babisa, who have fled from the west."

At page 189 he describes some Wydah birds:—

"A family of ten Wydah birds (*Vidua purpurea*) come to the pomegranate tree in our yard. The eight young ones, full-fledged, are fed by the dam, as young pigeons are. The food is brought up from the crop without the bowing and bending of the pigeon. They chirrup briskly for food: the dam gives most, while the red-breasted cock gives one or two, and then knocks the rest away. . . . The young ones lift up a feather and play with it as a child with a doll, and invite others to do the same in play; so, too, with another pair. The cock skips from side to side with a feather in his bill, and the hen is pleased; Nature is full of enjoyment. . . . Cock Wydah bird died last night. The brood came and chirruped to it for food, and tried to make it feed them, as if not knowing death."

In one of his frequent bursts of indignation against African slavery he writes, p. 214:—

"But no one expects any benevolent efforts from those who cavil and carp at the efforts made by governments and peoples to heal the enormous open sore of the world. . . . It is almost an axiom that those who do most for the heathen abroad are most liberal for the heathen at home. To this class we turn for help. With others arguments are useless, and the only answer I care to give, is the remark of an English sailor who, seeing slave traders actually at their occupation, said to his companion, 'Shiver my timbers, mate, if the devil don't catch these fellows, we might as well have no devil at all.'"

Of missionary efforts he writes, at page 246:—

"The spirit of missions is the spirit of our Master: the very genius of His religion. A diffusive philanthropy is Christianity itself. It requires perpetual propagation to attest its genuineness."

There is much wisdom also in the following remarks, which have a wider application than Livingstone perhaps intended, p. 256:—

"The pugnacious spirit is one of the necessities of life. When people have little or none of it, they are subjected to indignity and loss. My own men walk into houses where we pass the night without asking any leave, and steal cassava without shame. I have to threaten and thrash to keep them honest, while if we are at a village where the natives are a little pugnacious they are as meek as sucking doves. The peace plan involves indignity and wrong. I give little presents to the headmen, and to some extent heal their hurt

ensibilities. This is indeed much appreciated, and produces profound hand-clapping."

Mr. Waller throughout these two volumes entirely ignores the name of Sir Roderick Murchison, to whom Livingstone owed so much, and to whom he was so sincerely attached. This is Livingstone's comment on the death of his venerable and revered friend:—

"Alas! alas! this is the only time in my life I ever felt inclined to use the word, and it bespeaks a sore heart: the best friend I ever had—true, warm, and abiding—he loved me more than I deserved; he looks down on me still. I must feel resigned to the loss by the Divine Will, but still I regret and mourn."

One of the last entries before his death, when entangled in the spring-floods of the Bangweolo, notes the remarkable cry of the Sea-Eagle of that lake "as if calling someone to the other world."

The narrative of Livingstone's last sufferings and death, and of the transport of his body to Zanzibar, collected from his faithful servants Chuma and Susi, and Jacob Wainwright, has been admirably elaborated by Mr. Waller. He tells in fitting language the story of a deed equally to the credit of the African race and of our missions in the East; and every reader of it will heartily re-echo Mr. Waller's hope that none of those who assisted Livingstone, whether white or black, will be overlooked in England. Susi, Chuma, Wainwright, and the negress Halima, of the Missionary Societies cannot provide for them, should be supported by the British Government for the rest of their days. Of Halima Livingstone has recorded in his diary, May 29, 1872: "She is the best spoke in the wheel. . . . I shall free her and buy her a house and garden at Zanzibar, when I get there." She followed his body to Zanzibar, but her long services to him have remained entirely unrequited.

The illustrations of these volumes are very poor, and the likeness of Livingstone trashy and theatrical. The map has been most carefully drawn, and is of great service, although already obsolete, owing to the recovery of Livingstone's route map from the coast to Nyassa, by Cameron. The sheets of Cameron's survey of Tanganyika have now been received in this country, and it is to be hoped that this part of Mr. Waller's map will also be recast from them in any future edition of the Journals, in the preparation of which Mr. Waller should seek the assistance of some geographer.

GEORGE BIRDWOOD.

The History of India from the Earliest Ages.

By J. Talboys Wheeler. Vol. III. Hindu, Buddhist, Brahmanical Revival. (London: Trübner & Co., 1874.)

MR. TALBOYS WHEELER recommends himself to the reading public as a new historian of India by official and literary experience of some years. He possesses, moreover, a clearness and terseness of style which can hardly fail to secure him a favourable first impression. And although he goes over ground which for the greater part has been trodden by previous writers, whether historians, philosophers, or philologists, he shows a confidence in his own powers, as well as his own knowledge and research, which is not

simply an excusable feature in his handiwork, but rather an essential warrant of fitness for the duty he has undertaken. With such a task before him, we do not envy the man who does not feel strong to execute and able to discriminate. Of course there will always be a difference of opinion as to the method pursued in enlightening and guiding the attention of the reader, when treating of a period of years countable by thousands; a period which comprises quite as much of religious and ethical development as of matter-of-fact reigns or dynasties. But the genuineness of the oracle should be acknowledged, even though, like the Pythian, its prose be preferred to its hexameters.

The author presents his third volume as a history "complete in itself." His two first volumes are not essential to its comprehension; and his coming volume will introduce new actors and a new scene. In this light the better way to review its contents will be simply as an account of the rise and progress of the Hindu power in India, the last chapter on the Portuguese being supplementary.

The two first chapters are so far introductory that they embrace no really fixed period. They look back upon the Kolarians, or aborigines of India, the Vedic Aryans, the Dravidians; and upon the Nāgas, "who were possibly of Dravidian origin;" and they show how Brahmanism took root in the double form of priesthood and philosophy; the first as a hereditary institution, the second as a school varying in numbers and intellectual power. They are rather disquisitions than historical narrative; but they are full of interest, and supply remarkably good reading. If there be discerned, among the more didactic paragraphs, somewhat of exuberance in a certain popular and *ex cathedra* writing, the charge need not be a matter of cavil or surprise. The style is catching; and as it is, moreover, telling, is not so willingly or easily shaken off as may be supposed. If an imitation at all, it is not of an individual, but a class; and the class represents the spirit of the hour.

The third chapter is descriptive of the life and writings of Gotama Buddha, otherwise Sākya Muni, the founder of Buddhism. There is little that is new in this as a narrative; nor indeed is there much of personal incident to relate. The principal figure is interesting and not too highly coloured; but we do not feel sufficiently sure of his personal attributes and individuality to set him side by side, as does our historian, with the Prophet of Islam. In one thing both are alike. The morality which they inculcate is an emanation of human frailty. At its best it is the cry of the fallible philanthropist looking upward. In no case has it the character of the immeasurably higher teaching of Sinlessness. Mr. Wheeler places them in direct contrast when he says:—

"One was intellectual and spiritual, the other was sentimental and intensely human. The benevolence of Gotama took the form of a passionate yearning to deliver mankind from its hopeless imprisonment in an eternity of transmigrations; and according to the Brahmanical teaching of the time, a life of celibacy and mortification was the first and all-essential step in this direction. The pleasures of female society were supposed to be the most powerful obstacles to religious progress; the

deadliest of all the sins that enthralled the soul in the universe of the passions. The culture of Mohammed was altogether different. His conception of God was that of deified humanity; merciful and compassionate to all who worshipped him, but wrathful and revengeful towards all those who disobeyed his laws or followed after other gods. The idea that the love of woman was injurious to the soul never crossed the mind of the old Arab prophet. On the contrary, the sympathy and companionship of women were the mainstay of his religion, and thus the Koran and polygamy went on hand in hand."

The above fiat may not find very general acceptance in the abstract; nor do we think the distinctive qualities given to the respective systems capable of analysis. The religious culture of Gotama was, we are told, "intellectual and spiritual," that of Muhammad "sentimental and intensely human." May it not be truly said, on the other hand, that a "passionate yearning for the deliverance of mankind from the miseries of existence," combined with the practice of "celibacy and mortification," as means to the end, savours of "sentiment;" and, as argued by a very recent authority,* is there not in the religion of Muhammad that marked spirituality which rejects human intervention between the soul and the Creator, and is especially abhorrent of idols and images? Whether "intensely" be correctly applied or not, we may be permitted to doubt, unless humanity be held sorely restricted in its comprehensiveness.

A chapter follows on Greek and Roman India. It is a skilful summary of data derived from popular annals, the truths of which, though digested and expounded by earnest students, never seem to have been generally realised. The period is both eventful and interesting when Western classical history blends with the record of Eastern creeds and systems; when Sandrokottos and Megasthenes are found confronted with Brahman and Buddhist monarch or chief; when scenes which seem to have been first displayed to us by a modern incident of conquest and annexation are reviewed in the light of remote antiquity. But the association of the Hindu as we now see him, with the heroes of our school classics as we have heretofore portrayed them, is more or less unnatural; and however familiar with the statue of an elderly Governor-general in the scant garb of a Proconsul, few Anglo-Indians have, probably, thought seriously of Porus as of a Rajput Rāja, whose interview with Alexander might aptly be likened to that of Ranjit Singh with Lord Ellenborough. Stranger still is it to conceive that another Porus should have sent to Augustus Caesar an embassy of high-caste natives, one of whom, as cited by Mr. Wheeler, performed an act of self-immolation at Athens. In these days of extended intercommunication—when the Hindu and Indian Muhammadan are freely moving in the salons of London fashion, or lecturing to British Societies on British soil; when the Parsi finds his way to European courts, not excluding the Kremlin or the Vatican—we should scarcely wonder at these things: but looking back upon past ages, uncon-

* Mr. Bosworth Smith. See Review of *Muhammad and Muhammadism* in the ACADEMY of June 6 and June 20, 1874.

scious of steam or rail, we cannot believe it possible that Sappho could have known Sākya Muni, or, many centuries later, Macbeth have met Mahmūd of Ghazni! Yet it may reasonably be supposed that these incongruous couples were contemporary, each individual with each individual respectively.

Mr. Wheeler endeavours to explain the apparent anomaly of the marriage of a Hindu Rāja to a Greek princess, by the circumstance that Sandrokottos may have been a convert to Buddhism, and consequently not unwilling to prove to his Hindu subjects that he had thrown off the trammels of caste. And he alludes to a *vezata quaestio* which subsequently engaged the attention of Hindus, "as to whether the son of a Rāja by a Sudra Queen could inherit the throne?" Can he be aware that the Pandits of Benares were consulted on this very point by a gentleman who, in the early part of the present century, enjoyed the reputation of Oriental scholarship; their unanimous opinion being, that in the time of Sandrokottos (Chandragupta) the "Yavanas," or foreigners, were held in general respect; but that, as regards this particular monarch, he was himself a Sudra, or of the lowest class? * Or, bearing in mind the forgeries practised on the contributors to "Asiatic Researches" by the Pandits of those days, has he taken the opinion of men more learned in the ways of Western civilisation, and better acquainted than their predecessors with the objects of Western research, and found it trustworthy?

Inasmuch as nearly seven centuries are disposed of in little more than a page (pp. 239-40), and three particular epochs only in a thousand years are made the standing-points of narration or discussion, the contents of Chapter V. might have been appropriately designated, "Buddhist India in the Days of Asoka, and the Chinese Travellers Fah-Hian and Hiouen-Thsang." Chapter VI. might be detached from the book and transferred to the pages of a Quarterly, without so much as a change of title or other modification than the formal insertion of the latest editions of *Sakuntalā*, the *Mrichchakati*, *Mudrā Rākshasā*, and other Sanskrit plays prepared for the British public by Professors Monier Williams or Wilson. And Chapter VII. offers little more than a few *excerpta* from two substantial volumes on Rajputāna published more than forty years ago, the undoubted value of which work would be greatly enhanced by rearrangement and revision. But it should, in justice to the author, be admitted that, considered as parts of a history of India, or in any shape, the two first of the above three chapters are very acceptable contributions to literature. The story of the "Toy-cart" is especially well told.

Chapter VIII., or "The Brahmanical Revival," is practical in resuming the histori-

cal thread, and reintroducing dates, though in very round numbers. But, without the Muhammadan element, the thousand years of which it nominally treats present but a circumscribed field to the Indian historian. No wonder, then, that between forty and fifty pages are here filled up with a *résumé* of Hindu mythology, and passages from the travels of Marco Polo and Mr. Ralph Fitch. Chapter IX. completes the volume with an interesting if not an exhaustive account of Portuguese India.

Many extracts might be made in proof of what we have said on the literary merits of this volume. Passages readily offer themselves in every chapter to refute the notion that habitual official composition hampers the more general descriptive power. For ourselves, we detect little of the secretariat summaries of the author in the present case; and we happen to know something of them. Viewing the work in its isolated character, it is instructive and entertaining. Of its historical value we are sure in one sense: it reconnoitres, and affords a good incipient comprehension of the ground to be traversed. It indicates notable epochs, and gives a significance to particular chasms in a dim retrospect, even if it does little to supply the immense blanks in an important chronicle of ages. It is, at least, a welcome accession to the information already recorded on a subject well worth the expenditure of time and labour.

Had we, on closing the book, to specify the more palpable defect suggested to us in the course of perusal, we might record the impression that Rajputāna would have borne further elaboration; and that a study of the State of Jesalmér alone would have shed a new light on the Jain temples and Jain people.

F. J. GOLDSMID.

NEW NOVELS.

The Italians. By Frances Elliot. (London: Hurst & Blackett, 1875.)

Fair in the Fearless Old Fashion. By Charles Farmlet. (London: Samuel Tinsley, 1875.)

Antony Brade. By Robert Lowell. (Boston: Roberts Brothers. London: Sampson Low & Co., 1874.)

Greed's Labour Lost. By the Author of "Recommended to Mercy." (London: Samuel Tinsley, 1875.)

The Blossoming of an Aloe, and The Queen's Token. By Mrs. Cashel Hoey. (London: Hurst & Blackett, 1875.)

WE have seldom read a more satisfactory book of its kind than *The Italians*. Whether that kind is of the highest, or indeed is high at all, is perhaps rather a different question. It is hardly a book that any one would care to read twice; but on the other hand it is a book that one reads through with decided interest and pleasure, and that one lays down with a feeling of satisfaction, not by any means because the reading is over, but because the time occupied has been pleasantly occupied. Only in the third volume does the interest flag a little, chiefly because the situation becomes for a time more tragic and more complicated than suits the general

light and easy tone of the book. The writer has managed the picture of Lucca and its interiors, which fills the first hundred pages, with great skill, so that its photographic minuteness is not in the least wearisome. The ancient Cavaliere Trenta, moreover, is a capital sketch. The "Red Count" Marescotti, who unites piety, poetry, and communism, strikes us as somewhat overdrawn; at any rate, if he is a fair type of any portion of Young Italy, March hares may be looked upon as sane and sober in comparison with these young persons. It would be easy, too, to find fault on reflection with many of the other personages, but the merit (if it be a merit) of the book is, that it has sufficient "go" to carry one through a first reading without attracting much attention to these deficiencies. Whenever we are getting a little tired of the characters, the author artfully inserts a little bit of description of place or person which puts us in good humour again. A tendency to rather theatrical soliloquy, and here and there a religious or political sneer which is not in the best taste, are faults which it is more difficult to pardon; but still the book is one which is far more easy to find fault with than to dislike or to drop when one has once begun it.

Mr. Charles Farmlet has, it appears, an "enthusiastic admiration" for Mr. Swinburne, which is certainly creditable, and it would seem to have occurred to him that it would be a good way of expressing that admiration to write a novel, dedicate it to the poet, christen it by a phrase from "Dolores," and prefix mottoes from the *Poems and Ballads* to nearly every chapter. We do not know that there is any positive objection to this proceeding, except that the result would be rather terrible if the example were generally followed, and if everybody who has a favourite English poet were to write a novel in two volumes in order to apprise the public of the fact. But unluckily *Fair in the Fearless Old Fashion*, despite very loyal efforts on the part of its author, does not at all carry out the promise of its title and its mottoes. We cannot conceive anything less like Mr. Swinburne's goddess-heroine than Mr. Farmlet's American widow, who falls in love at first sight with a good-looking noodle, makes such unskilful use of her personal charms that she cannot entice him away from his betrothed, tries to ruin his reputation in order to get him in her power, spoils everything by interfering with her own plot before it is ripe, and finally poisons herself in the most horribly commonplace manner. But the book is rather unsuccessful than positively bad; there is really a certain amount of interest about it, and it is decently written. If Mr. Farmlet should wish to exhibit his admiration for somebody else in the same way, he should take a friendly suggestion, and "convey," in the language of the wise, his situations a little less openly. The well-known conservatory scene in *Guy Livingstone* is worked in twice, and the plot against the hero is discovered in exactly the same manner as the plot against the beloved friend of our youth, Peter Simple, not to mention suspicions of similar utilisation in almost every chapter. Also, we should like

* Lt.-Colonel Wilford, quoted in Maurice's *Hindustan* (vol. i. part i. page 35), a work which bears high testimony to the abilities and research of the author, and merits the close attention of all students of Indian history. The Rev. Thomas Maurice, Assistant Keeper of the MSS. in the British Museum, died in his apartments at that institution on March 30, 1824. His legacy of labour, notwithstanding the lapse of half a century, should not be forgotten, either in reviewing India from the death of Alexander, or in an exposition of the Hindu mythology.

to know why an Englishman having to mention an Italian should call him "Pic de la Mirandole"?

Antony Brade is scarcely a novel, being merely a tale of American school life. When one has succeeded in attuning one's mind to the proper key, and in getting one's teeth off-edge (if the expression be allowable), it is discovered to be a rather pleasantly and genially written book of its kind; but if the American boy be what he is here represented, he is certainly a most curious "sport" in the botanical sense.

"When a poor widow left with five little ones, and only the resources of a poor enough brain to which to turn for their support, buys—as the *Saturday* so funnily wrote—her 'inkbottle' and sets to work to write, she should, provided that she gives forth to the easily-pleased few who read her books no harmful words, be protected, and that by the might of the law, from injury."

Such are the ideas of the author of *Greed's Labour Lost* on the subject of criticism. It is certainly fortunate for us that this new *quis quaque liberorum* is not yet recognised, for we must say that the possession of five little ones, a poor brain, and an inkbottle does not seem to us a sufficient excuse for spoiling the taste, wasting the time, and weakening the brains of the easily-pleased few, or rather many, who look to novels for almost their only intellectual food; and still less does it seem to us (to drop the moral view) a sufficient excuse for the undisturbed production of what is intrinsically and artistically bad. But there really is nothing in *Greed's Labour Lost* to require all this protesting on the part of the author against the "dread artillery of criticism." The book is not specially silly, or vulgar, or extravagant. The heroine in the first volume behaves rather badly to her uncle; in the second she marries her cousin and behaves rather badly to him; in the third (the unfortunate cousin being well disposed of) she becomes the guardian angel of her family, and marries somebody else. The *dénouement* reminds one of the immense advance which we have made on our fathers and grandfathers in this matter. They—good souls—used to put a young lady or a young gentleman in difficulties as to whom they should choose; but when the choice was made, it was made. Now we are all of us alive to the great conveniences of second marriages. The only thing we find to wonder at is, that the indulgence is usually limited to two. We all know cases in which young ladies are engaged to three or four persons in a twelvemonth, and marry some one else six months after. Only think of the delightful intricacies of plot which might be indulged in, if a heroine had to bless and dispose of four or five happy and moribund beings in succession! Let us respectfully offer this to the author of *Greed's Labour Lost* as a ground-plan for her next novel, and so endeavour to make amends for the woes which she has evidently suffered at the hands of former critics.

Mrs. Cashel Hoey is another instance of a novelist succumbing to the temptation of making three people happy. But as the hero of *The Blossoming of an Aloe* allows some fifteen or twenty years to pass between his two marriages, the sternest censor can

hardly grudge him his elderly raptures. Mrs. Hoey's *aloe* does not, from the nature of the case and the medium of representation, blossom quite so musically as Mr. O'Shaughnessy's, but the story of its blooming is very pleasantly told, and the heroine, Anne Cairnes, is a decidedly satisfactory heroine. Indeed, all the characters from the cruel mother downwards are very fairly drawn, though there is nothing particularly striking about their conception, and the story, which has no great body, is perhaps unnecessarily prolonged. Even as it is, Mrs. Hoey has been obliged, after the manner of conscientious bakers, to throw in *The Queen's Token* as a makeweight. This latter, which is a tale with some legendary elements, is, like the longer work, pleasant and pleasantly written, but perhaps a little thin. We are very glad, however, to see that this writer has struck a quieter vein of incident than that which she worked in her earlier stories. Plots and murders, and things that live behind iron doors are not at all necessary to one who can bring to bear on more legitimate matters the freshness and good taste which Mrs. Cashel Hoey undoubtedly possesses, and has shown in this book.

GEORGE SAINTSBURY.

NOTES AND NEWS.

THE official work on Persia, to be published by Messrs. Macmillan, is now passing through the press. The second part indeed, containing the Zoology, by Mr. Blanford, with numerous excellent illustrations, is already printed. The first part opens with an original and most valuable chapter, by Major St. John, on the Physical Geography of Persia; followed by narratives of his journey from Shiraz to Baluchistan, and of Major Lovett's in the latter region. There are chapters on the geology of Persia by Mr. Blanford, and the work is completed by Major Euan Smith's narrative of a journey through Sistan and Eastern Persia from Bandar Abbas to Mash-had.

LIEUTENANT-COLONEL HENRY FISHWICK, F.S.A., of Rochdale, author of the *History of the Parish of Kirkham*, &c., has now in the press a book to be entitled *The Lancashire Library*—a bibliographical account of books on topography, biography, history, science, and miscellaneous literature relating to the County Palatine, including an account of the Lancashire tracts, pamphlets, and sermons printed before A.D. 1720, with collations, and bibliographical, critical, and biographical notes on the books and authors. In compiling this work not only the British Museum, the Bodleian, and other public libraries, but the many large and valuable private libraries in Lancashire have been laid under contribution. The number of books noticed (exclusive of the various editions) will exceed 750, which, with the tracts, sermons, &c., printed *ante* 1720, will make up a total of over 1000. In nearly all cases a copy of the title-page will be given, together with the size, &c., list of illustrations, and price; and to this, in the case of scarce works, will be added the name of the library where a copy is known to be. The want of such a book has long been felt, and we are sure it will be welcomed by all who take an interest in the literature of Lancashire. The author has wisely, we think, only included books which actually refer to the county, all of which illustrate in some way the history of Lancashire and its people.

WE are at last to have a complete edition of the Prose Works of Wordsworth, which he himself expected and desired to be given to the world by Dr. Wordsworth or Mr. Quillinan. The task

has now devolved upon the Rev. A. B. Grosart, who has been selected as editor by the family. Among the prose works but little known, or absolutely unknown to students of the poet in the present generation, we may mention *An Apology for the French Revolution: By a Republican*, now first published; tract on the Convention of Cintra, so scarce that a copy has sold for ten guineas; a letter, now first printed, transmitting the *Letter to Sir Charles W. Pasley, K.C.B.: Two Addresses to the Freeholders of Westmoreland*, 1818, very scarce; various Letters and Speeches on Education; *A Letter to a Friend of Robert Burns*, 1818, very scarce; two Essays on Epitaphs, from unpublished MSS.; *A Guide through the District of the Lakes*, and *The Kendal and Windermere Railway*, with which Mr. Ruskin must find himself in the fullest sympathy; the whole of the I. F. MSS. in their entirety, as written down to the dictation of Wordsworth by Miss Fenwick, "delightfully chatty and informal," and hitherto but very imperfectly published. The book will include a number of original letters, and accurate reprints of those already published, and a collection of conversations and personal reminiscences of Wordsworth. This edition of the Prose Works of Wordsworth, which bids fair to be a contribution of the first importance to English literature, will be published by Messrs. Moxon, in three volumes demy octavo, at the price of two guineas. It will be dedicated, by express permission, to the Queen, and with the dedication will be printed a hitherto unpublished poem by Wordsworth, addressed to the Queen on the occasion of sending a gift copy of his Poems to the Royal Library at Windsor.

A NEW series of English Classics, edited with Introductions and notes, is about to be issued under the direction of Mr. Forreast, Head Master of the High School, Surat, and Mr. J. W. Hales. Among the editors are Professor Dowden, Mr. Thomas Arnold, Dr. Morris, Dr. Abbott, Mr. Furnivall, Professor Ten Brink of Strasburg, Professor Wagner of Hamburg, Professor Henry Morley, &c. It is to be called the London Series, and to be published by Messrs. Longmans and Co.

The Children of the World will be published in future by Messrs. Henry S. King & Co., who have at press a new work by the same author, entitled *The Children of Religion*.

MR. JOHN NOBLE has in the press a volume of more than 300 pages on national finance, reviewing the policy of the last two Parliaments, and the results of modern fiscal legislation.

MR. SPEDDING is preparing a paper for the New Shakspeare Society, giving the results of his comparison of all the differences between the first Quarto and the Folio of *Richard III.* Curiously enough, he finds that the reviser of the first Quarto does not carry his work of revising beyond the beginning of the third scene of act v. From l. 47 of that scene to the end, the variations between the Folio and first Quarto are not corrections, but misprints, almost all copied from the late Quartos, and all wrong but one.

THE death of Alderman Wilkinson, of Burnley, is a serious loss for Lancashire archaeology. Thomas Turner Wilkinson was born March 17, 1815, near Blackburn, his father being a farmer averse to "larning." The feeling was fortunately not hereditary, the son devoting himself to mathematical studies with great energy. As early as 1839 he contributed to the mathematical section in the *York Courant*, and since then his papers on this branch of science have been very numerous. He was a Fellow of the Royal Astronomical Society, and was a member of the Historical Society of Lancashire and Cheshire, the Manchester Literary and Philosophical, and Geological Societies, and of the Manchester Literary Club, to which association his last book was dedicated. He was a working member of all these

societies, and the list of his contributions to their Transactions is long and varied, ranging from "Problems on Contact" to "Spenser and the East Lancashire Dialect." In conjunction with the late Mr. Harland, he wrote the two works by which he is best known to the general reader. *Lancashire Folk Lore* (1867), and its sequel, *Lancashire Legends and Traditions* (1873), take high rank among books of this class. He died on February 6, and the funeral, which took place on the 10th, was attended by representatives of the societies named, of the corporation, and of most of the public institutions of Burnley. As a mathematician, bibliographer, and antiquary, he had a more than English reputation, and his genial disposition and readiness to impart information will make him greatly missed by his numerous literary friends. His MSS., it is understood, have been left to the Chetham Library at Manchester. His last literary work was published only last month, being a revised and enlarged edition of the *Ballads and Lyrics of Lancashire*, issued some years back by Mr. Harland.

A sum of 1,050 fr. was given last week in Paris for a receipt signed in Rome, in 1548, by François Rabelais.

As the English public will not give its Early English Text Society money to enable it to print quickly enough the manuscripts which contain the early history of our language and our social state, Germany is coming to the rescue, as she did long ago in the case of French manuscripts. Professor Carl Horstmann, of Magdeburg, has just published at Paderborn (F. Schöningh), a most valuable selection of Early English Legends, the Childhood and Birth of Jesus, Barlaam and Josaphat, and St. Patrick's Purgatory, and means to follow it up by another volume containing the legend of Gregorius (from a unique MS. in the Bodleian, of the time and style of *King Horn*, early thirteenth century), the Miracles of our Lady, and the Legend of Pope Celestine. In his present volume Professor Horstmann gives "The Childhood of Jesus" from the early thirteenth century Laud MS. 108 (believed to be unique); "The Birth of Jesus" in parallel texts from the early fourteenth century MSS., Ashmole 43 and Egerton 1993, with the long continuation from the Egerton MS. alone; "Barlaam and Josaphat" from the fourteenth century MS., Bodley 779; and "St. Patrick's Purgatory," from the Ashmole MS. 43, the Egerton 1993, and the Laud 108. In Appendixes he adds "A Disputation betwene chi(1)d Jhesu & Maistres of þe lawe of Jewes" from the grand Vernon MS. in the Bodleian, before A.D. 1400; and two more versions of "Barlaam & Josaphat," the first from the Vernon MS. in the Southern dialect, and the second from Harleian MS. 4196 in the Northern dialect. A full preface on the Early English Legend-manuscripts, giving lists of the Lives in all the British Museum and Bodleian MSS., with comments, a list of exceptional rhymes and the assonances in his texts, &c., complete this volume, which is a credit to its editor and a welcome help to all Early English scholars and students.

MESSRS. MACMILLAN have in the press a *Practical Treatise on the Diseases of the Eye*, by R. Brudenell Carter, F.R.C.S., ophthalmic surgeon to St. George's Hospital. The work will be copiously illustrated by lithographs and woodcuts, and is intended to be a familiar exposition of the present doctrines and modes of treatment of English ophthalmic surgeons, adapted to the wants of both practitioners and students.

WE have received a corrected reprint of a very admirable address delivered by Mr. James Parker of Oxford, on January 27, to the members of the Reading Archaeological and Architectural Society. Passing in review the chief points of interest in the early history of the ancient borough, its conflict with the Danes in the ninth century and its mention in the Norman Survey, Mr. Parker enlarged upon the grandeur of the Abbey, and the

similarity in the structure and dimensions of its church to the Cathedral of Canterbury at the time of Thomas Becket, who came down to Reading to consecrate the Abbey. The chapel corresponding to the scene of the archbishop's murder at Canterbury is now, he complained, used as a coal-hole by the Roman Catholic priest whose house is adjacent. We hope the new Reading Society may prosper.

M. MICHEL CHEVALIER has published the opening lecture of his course of Political Economy for the present session in the College of France, under the title *Des Moyens pour un Etat de refaire ses Finances*. This subject has, of course, more importance for France at the present moment than for most other countries, but M. Chevalier's lecture discusses it on principles of general application. The emancipation of production and trade from all restriction is the method of financial reform he advocates. We had thought it hardly possible to say anything new on the point, but M. Chevalier has succeeded in giving freshness and novelty to its exposition. We are glad, too, to observe that, uncompromising free-trader in the widest sense though he is, he does not go the length, with Mr. Bright, of regarding adulteration as a form of competition with which the State ought not to interfere. Nor does he oppose the intervention of the State in assisting the construction of railways in countries where private enterprise is unequal to the task. But he appears to overrate the extent of competition between railway companies in England, where the constant tendency for some time has been towards amalgamation or combination, and consequent monopoly. We can recommend M. Chevalier's instructive lecture to experts as well as beginners in political economy; but, on the subject of English railways, we think those who can read German would do well also to study the remarkable work of Dr. Gustav Cohn, lately published at Leipzig.

It is reported that the late Professor of History at Zürich, Dr. H. H. Vögeli, who died at the close of last year, has left important manuscripts referring to the Transactions of the Oecumenical Council, which will shortly be published. *The Swiss Chronicle* for 1873, which appeared not long before his death, and in which he had given a most useful summary of the events of the year, will, it is stated, be continued by the publishers, Messrs. Schwabe, of Basle.

THE Royal Scandinavian Society of Literary Antiquities ("Kongelige Nordiske Oldskriftseelskab") has just celebrated its fifty years' jubilee in Copenhagen. The society was founded on January 28, 1825. The president, the King of Denmark, received the members in the Palace of Amalienborg early in the morning. Vice-president Worsaae opened the meeting with an eloquent address, in which he recapitulated all the society had accomplished since its foundation by C. J. Rafn, and enumerated its most important publications, some of which, as the *Antiquitates Americane*, had attracted the attention of the whole learned world to Denmark and to the Society. The accomplished Vice-president then mentioned that several important works were at this moment passing through the Society's press, among others a splendidly illustrated monograph on the remains discovered at Jellinghøj, and a large as well as a small edition of *Nydaasaga*. Before the meeting closed, the names of the King of Greece and of the Czarewitsch were added to the list of members.

A FRENCH translation of Alfred Larsen's *Life and Works of P. Chr. Asbjørnsen* has been printed in Christiania and circulated privately throughout Europe. It will, without doubt, tend to widen the circle of the personal acquaintance of this great writer. To be so widely known throughout the literary world is an honour that few authors, and still fewer comparative mythologists, attain during their own lifetime. The book is adorned with a

good portrait. We would suggest that the time had fully come for another reprint of Dr. Damm's translation of Asbjørnsen's and Moe's *Tales from the Norse*, which has long been unattainable.

A NEW monthly journal of philosophy and science is to appear at Naples, under the direction of Professors Francesco Fiorentino and C. M. Tallango, entitled *Giornale napoletano di filosofia e lettere, scienze morali e politiche*.

A VERY touching exchange of presents has just taken place between the Queen and the Empress Eugénie. Her Majesty the Queen sent to the widow of Napoleon III. immediately after her return to Chislehurst from her visit to Windsor Castle, the first volume of Theodore Martin's *Life of the Prince Consort*; and this week the Empress Eugénie has presented to Queen Victoria a superbly bound copy of the first two volumes of Mr. Blanchard Jerrold's *Life of Napoleon III.*

IN accordance with the financial reports recently published at Berlin, the German budget is charged with a sum of 923,980 mark for the Prussian universities, including Münster and Braunschweig. Of this sum 60,000 mark. are assigned to the purposes of augmenting the salaries of teachers, and assisting meritorious students. This falls short by nearly 29,000 mark. of the amount appropriated last year for the same object, owing to the fact that some university chairs have been better endowed in the interval, and no longer need further supplementation. A provision is made in the budget for "assistant teachers" at the universities, whose position is now for the first time officially recognised by a grant of 54,000 mark. for the payment of their stipends. The University of Berlin, which has been enlarged by the establishment of several new chairs, has now a staff of sixty-three ordinary, and forty-two extraordinary professors, five of each grade belonging to the faculty of Theology, eight of the former and two of the latter to that of Law; and, while fifteen ordinary and eight extraordinary professors compose the medical staff, the faculty of Philosophy is presided over by as many as thirty-five ordinary and twenty-seven extraordinary professors.

THE last number of *Unsere Zeit* (February 5) has an article on the present condition of Strasbourg, from which it appears that the University and Town Library is rapidly recovering its former prestige. As many as 44,500 volumes have been secured for it during the last year, of which 34,000 were obtained by purchase, and the remainder through private donations, and by these additions the entire collection has been raised to upwards of 344,000 volumes in all.

THE *Theological Review* for January contains an article on Ewald's *History of the Hierarchy in Israel*, by Francis R. Conder, which is not quite worthy either of its subject or of the review in which it appears. The author entertains an exaggerated belief in the later Jewish tradition, and takes Ewald to task for extending the principle of development, which rules in all other histories, to the history of Israel. He treats the history of the people of Israel somewhat as uneducated preachers are apt to treat the words of the Bible: to judge by the language he uses, it was brought out in England the other day. His knowledge of Judaism is drawn not from the really great Jewish critics, but from the Abbé Chiarini. And his Semitic scholarship may be measured by his derivation of Bedouin from Midianite. "The change of one servile letter for another turning Medeen into Bedeen."

In the *Fortnightly Review* the editor begins a study on Diderot, a subject much worthier of an estimable writer than Voltaire or Rousseau. Professor Cairnes concludes his protest against certain tendencies of Mr. Herbert Spencer's Sociology; but, as Mr. Herbert Spencer reminds us, in a note on Professor Cairnes's article, we must wait till

the *Principles of Sociology*, in three octavo volumes, are published before we can tell whether criticisms based on a comparatively concise and popular work are premature or not. Mr. Swinburne's unknown poet is a certain Mr. Wells, a contemporary of Keats, who wrote a play on *Joseph and his Brethren*, with no construction, but much command of the poetical dialect of the Elizabethan age. George Smith, the author of the *Cry of the Brickfield Children*, has an article on our Canal Population. He has not asked himself whether they are miserable as well as barbarous.

In the *Contemporary Review*, Professor Lightfoot deals with the series of confusions and misquotations by which the author of *Supernatural Religion* has bolstered up Volkmar's view, that a plausible and ambiguous statement of Malalas, a very inaccurate author of the sixth century, is to supersede the mass of evidence that Ignatius suffered at Rome. Professor Clifford treats of the postulates of the science of space in somewhat the same spirit as Mr. G. H. Lewes in the *Fortnightly Review* for August 1874, with a fuller development and illustration, perhaps with less maturity and precision of thought. Mr. Fitzjames Stephen gives an account of the curious penalties to which unpopular thinkers are still legally liable; for instance, Mr. Mill might have lost his place at the India House and been imprisoned. Father Bridgett attempts to rebut Dr. Lyon Playfair's charge that the mediæval Church proclaimed the Sanctity of Dirt, on the ground that the extreme neglect of their persons by some saints was exceptional, and that, as a rule, the Church did nothing but protest against self-indulgence. This falls short of the truth. The bath was the standing luxury or necessity of southern cities, as the daily pint or dram is the standing luxury of northern cities now. "In cute curanda plus æquo operata juventus" found the pleasant sense of being alive all over which followed the daily bath the best thing the day could give. The Church, rightly or wrongly, thought this pleasure dangerous, as the Mahometans think it now, and for whatever reason, when civilisation began to reconstitute itself in Southern Christendom, the bath did not reappear.

In *Macmillan* Mr. Freeman informs us that most of his examinees at Oxford think Orange is in the Netherlands, along with much other instructive matter about that little Burgundian principality. Professor Munro replies with much force, and not a little natural severity, to Mr. Keble's strictures on recent Latin verse. He succeeds in showing that the school to which Gilbert Wakefield belongs are not faithful to their original, and are more or less slovenly in language and thought. Does he succeed in showing that they have not a superficial likeness to Latin, an appearance of clearness, almost a reality of ease and flow which have disappeared in the work of their successors, who have escaped their faults?

In *Fraser* Professor Newman has an interesting paper on Vegetarianism, chiefly from the economical point of view, insisting on the growing difficulty of supplying large towns with an increasing quantity of meat, and on the certainty that a larger area is required to feed a meat-eating than a vegetarian population. F. R. C. has another rabbinical article on the literary history of the word "Messiah," implying that the current argument from prophecy rests mainly on an arbitrary patristic cento from the Targums. Mr. Carlyle's abridgment of Snorro is continued to the death of St. Olaf.

The most interesting article in the *Cornhill*, "Have we Two Brains?" is based on Brown-Séquard's researches; the writer is inclined to adopt his theories, but to question their practical utility. "Thoughts about Thinking" is a collection of genial and sensible observations on a subject too close at hand to be other than unfamiliar. A writer who has been permitted to use the unpublished materials for Shelley's life, states posi-

tively that he was little to blame for the way his first marriage ended. "S. C." has a learned article on Piero della Francesca, who, it is conjectured, took to mathematics at the age when, according to Vasari, he left off painting, because he lost his eyesight. Vasari's other bit of declamation about the ingratitude of Pacioli in profiting without acknowledgment by Francesca's writings, is refuted by copious acknowledgments in more than one of Pacioli's, from the last of which it appears that Francesca was still alive in 1494.

In the *Revue des Deux Mondes* for February 1, George Sand begins a novel, the subject of which recalls our "penny dreadfuls." The story is appropriately narrated by a *volet de chambre*, but still the ineffaceable distinction of the author is a relief after M. Cherbuliez's recent story, told with inconceivable "impudence" in the etymological sense, of how an English "Miss" threw herself at the head of a moody and handsome French *savant*, and brought him down at last. M. Othenin d'Haussonville, one of the three recruits from the Right Centre who gave the historian of St. Louis a chance of organising the third republic, concludes his pitiless study of Sainte-Beuve with a ferocious phrase of Cousins's, who said when Mérimée and Sainte-Beuve were being discussed, "Savez-vous la véritable supériorité de Mérimée sur Sainte-Beuve? Je vais vous la dire: Mérimée est gentilhomme, Sainte-Beuve n'est pas gentilhomme." Gaston Boissier has an article on M. Luce's edition of Froissart, which contains an interesting account of the three redactions of his great work, and several ingenious and unforced historical parallels.

THE following Parliamentary Papers have lately been published:—Statement exhibiting the moral and material progress and condition of India, during the year 1872-73, with maps, &c. (price 8s.); a Return of the Provisions made by each School Board for the Religious Teaching of Children (price 9d.); Correspondence between the Admiralty and the Rev. C. M. Ramus on certain Experiments conducted by them, with sketches, &c. (price 3s. 8d.); Return of the Population, Number of Electors, &c., of each City, Town, and Borough, returning a Member or Members to Parliament; Appendix to the Fortieth Report of the Commissioners of National Education in Ireland (price 3s. 6d.); First Report of the Civil Service Enquiry Commissioners, &c., &c.

WE have received *The Report of the Proceedings at the Dinner of the Cobden Club, July 1, 1874* (Cassell); *Protection from Fire and Thieves*, by G. H. Chubb (Macmillan); *The Problem of Irish Education*, by Isaac Butt, M.P. (Longmans); *The Dramatic Works of William Shakespeare*, edited by S. W. Singer, F.S.A., vol. iii. (Bell); *A Vision of Creation*, by Cuthbert Collingwood, M.A., second edition (Edinburgh: Paterson); *The Rudiments of Physical Geography for the use of Indian Schools*, by H. F. Blanford, F.G.S., third edition (Macmillan); *Theism*, an Address, by Brinsley Nixon, Esq. (Longmans); *Charles Kingsley*, a Sermon, by A. P. Stanley, Dean of Westminster (Macmillan).

THE forthcoming Part IV. of Mr. Alexander J. Ellis's great work on *Early English Pronunciation*

"contains his illustrations from contemporary writers of the pronunciation of the seventeenth and eighteenth centuries, an account of received English pronunciation, and the introductory matter to the new collections of English dialects which have been made for his work, in order to register dialectal pronunciation with a completeness hitherto unattained and even unattempted, as a necessary basis for understanding the pronunciation underlying our Early English orthography, which was wholly dialectal. These collections themselves, which have been already made to a sufficient and by no means scanty extent, will form Part V., to be published in 1875. That part will therefore be devoted to English Dialects. After it is completed, Mr. Ellis contemplates allowing at least two years to elapse before he begins Part the Sixth and last."

In his present Part IV.,

"thanks to the labours of the great Teutonic linguist Schmeller, Mr. Ellis has also been able to show the variations which interpenetrate one great branch of the High German dialects, the Bavarian (pp. 1357-1368); and, thanks to the extraordinary collection made by Winkler, just published in Dutch, to give English readers a general view of the present state of those Low German and Friesian dialects to which our own Anglo-Saxon language belongs, as they have developed under merely native influences, without the introduction of any strange element, like Celtic, Norman French, and Old Danish (pp. 1378-1428). These modern dialectal forms are invaluable for a study of our Early English dialectal forms, for, although chronologically contemporaneous with the English of the nineteenth century, they are linguistically several hundred years older. And they enable us to appreciate the state of our own English dialects, which are in fact merely a branch of the same, left untouched by Winkler, because, like our own, these Low German dialects (with the exception of modern Dutch, which is a literary form of provincial Hollandish), have developed entirely without the control of the grammarian, the schoolmaster, and the author."

NOTES OF TRAVEL.

THE very able and interesting paper on the subject of the Arctic Expedition, read by Admiral Richards at the meeting of the Geographical Society last Monday, conveyed some information respecting the instructions to its commander. There cannot be any doubt as to what the instructions to Captain Nares ought to be, and what the people of this country desire they should be—namely, to use his own discretion in carrying out the exploration of as large an area of the unknown region as possible, according to circumstances which cannot be foreseen. But it appears that he is to be trammelled by restrictions; he is not to go beyond the Pole; he is not to go east or west of certain meridians; but to advance due north towards the North Pole, as if he was some Alpine climber trying to reach a maiden peak. Nothing can be worse than the spirit which could conceive restrictions of this kind. They prove that there is no comprehension in high places either of the real character of the work that is required to be done, or of the best means of performing it. If Captain Nares is fit to command an Arctic expedition, he is fit to be trusted fully and unreservedly; and the country will not endure that he should be tied by foolish restrictions.

THE names of the Arctic exploring ships have now been decided upon. That of the *Alert* will not be altered. The *Bloodhound* will henceforward be the *Discovery*, a good old name formerly borne by Baffin's ship when he discovered Smith Sound, and by Captain Cook's second ship in his third voyage. Captain Nares has not yet decided which of the two ships shall be the advance and which the depot vessel; but all the work connected with strengthening and fitting is progressing rapidly and satisfactorily.

WE understand that Professor Newton, of Cambridge, has undertaken the Ornithological section of the *Arctic Manual*. It certainly could not be in better hands; and complete information as to all that is known of the birds of the far north will be specially valuable and interesting to the officers of the expedition.

THE despatch of the Arctic Expedition has stimulated the adventurous spirit of amateurs. Mr. Rickaby is a young sportsman who went up Baffin's Bay in the *Eric* in 1873, the same year in which Commander Markham made his voyage in the *Arctic*. In 1874 Mr. Rickaby hired the yacht *Sampson*, and visited Spitzbergen; and this year it is his intention to get a vessel and again to make a voyage up Baffin's Bay, in the direction of Smith Sound.

WE hear that Lieutenant Payer, the intrepid Austrian Arctic explorer, is making enquiries and preparations with a view to crossing the continental glacier of Greenland, from east to west.

The attempt has been made several times from the western side, but it has always been found impossible to penetrate further than from thirty to fifty miles. A success, or even a partial success, would lead to most valuable results in the elucidation of the important phenomena in physical geography connected with the formation of continental ice in the present and in past ages. Certainly a desperate adventure could not be undertaken under better auspices; for Julius Payer is one of the most renowned Alpine climbers in the Austro-Hungarian Empire.

THE collection of dried plants from the banks of Lake Tanganyika, made and sent home by Lieutenant Cameron, is now in the hands of Dr. Hooker. Unfortunately the specimens were injured on the way down to the coast, but they have been sufficiently preserved to be of use. The journal has also arrived, as well as the observations during Cameron's cruise round the lake, and a series of sketches. The carefully-prepared map of the lake, or rather of that portion south of Ujiji, is now in the hands of the Royal Geographical Society, and will shortly be published in the Proceedings of that body. It is as good and careful a piece of geographical work as has ever come from the interior of Africa.

Morgenbladet states that the German Polar Society in Kristvigen seems to be in a depressed state. The two newest, best, and most seaworthy of its ships have just been sold. It will be deplorable if this institution should fall into decay after the expenditure of so much money and thought.

A CURIOUS geographical problem is suggested by the appearance at the mouth of the Seine, near Havre, in the course of the present month, of one of the hermetically-sealed bottles in wooden cases which were thrown overboard during Prince Napoleon's North-Polar Expedition in 1860. Wooden-covered bottles of this kind were thrown into the sea daily in the month of June of that year from the Prince's ship, in the expectation that the course taken by them would lead to the elucidation of the direction of the greater oceanic currents, but during the fourteen and a half years that have intervened since then, none of these bottles have been seen till the present one was washed ashore. Its appearance at the mouth of the Seine seems to indicate that a polar current must be borne into the German Ocean, and must be carried thence through the Channel to the western coasts of France.

THE botanical products of the Queensland North-East Coast Expedition, the report of which we have recently received, are more important from an economic point of view than from any great novelties or peculiarities that they present. The discovery of extensive districts the soil of which cannot be surpassed in quality, and supports a truly tropical vegetation, including the bamboo, taro, and banana, is of more importance than new gold-fields. In some places, too, the timber trees were very fine, particularly of *Calophyllum Inophyllum*, *Eugenia grandis*, *Terminalia melmocarpa*, *Hernandia ovigera*, *Cardwellia*, *Cedrela*, *Alstonia*, *Castanospermum*, &c., &c. The rapid rise of Oooktown, on the Endeavour River, though not owing to the agricultural capabilities of the surrounding country, can only be maintained by its proximity to a district rejoicing in a fertile soil. Indeed, the settlement of this coast depends greatly upon this point, and the explorations thus far have resulted very satisfactorily, though barren wastes alternate with river valleys and alluvial lands.

BARON MUELLER, government botanist, Victoria, in his last report gives some interesting details of the results of recent explorations in the Upper Yarra, Hume River, and other districts. As might be expected, although the general physical features and the nature of the flora and fauna of most districts are known, every trip adds

new species to those previously known. In the forest regions of the Upper Yarra and the southern branches of the Goulburn River measurements were taken of some of the larger trees of *Eucalyptus amygdalina* var. *regnans*, the highest being approximately 400 feet, but it is believed that there are higher specimens, which, however, could not be measured on account of the labour of clearing away the dense jungle to get a base line. The magnificent grass, *Festuca dives*, first discovered in West Gippsland, was found in the same districts. This grass grows from ten to twelve feet high, or even as much as seventeen feet in the rich soil of the fern-tree gullies. In the Hume district an entirely new tree, "probably of medicinal value," *Bertya Finlayi*, was discovered. Many Tasmanian forms were traced northwards into New South Wales, and many facts observed are of great interest in phyto-geography. A list of additions to the genera of Australian plants during the year numbers fifty, and includes *Corynocarpus*, *Carmichaelia*, *Ilex*, *Lagerstroemia*, *Agrimonia*, *Embothrium* (sect. *Oreocallis*), *Ulmus* (sect. *Microptelea*), *Moraea*, *Areca*, *Wolfia*, and many others equally interesting to the student of the distribution of plants, besides fourteen absolutely new genera.

A SHORT report from Zanzibar, by Captain Elton, on Mti Sandarusi, or Gum Copal Trees of Dar-es-Salam, has just been printed among the Parliamentary papers. Captain Elton fully endorses Dr. Kirk's Report, published in the *Linnean Society's Journal* (Botany, vol. xi., paper on "Copal of Zanzibar and the *Trachylobium Mossambicense*"), for he was astonished at the immense number and size of these trees, far exceeding anything he had before imagined. The height of an average tree is about 60 feet, and the girth at bottom upwards of 4 feet. On stripping off the bark, the gum was found deposited in many places between it and the wood in a liquid form. The trees are suffering greatly from the attacks of swarms of ants and other insects, and are being slowly but surely destroyed, piece after piece, branch after branch. They are all festooned with the long intertwined ropes of the india-rubber *Uiana*, the thickly-matted cords of which, pendant from the main limbs and knotted into a sort of rigging, become an easy means of ascent to the natives looking for the resinous deposits on the branches. This india-rubber was worked rather extensively here at one time, but was soon given up as unprofitable, in consequence of the number of slave-lads carried off by leopards.

THE *North Otago Times* says that partridges appear to be spreading in that district. A brace have been repeatedly seen on Mr. Murray's land at Hampden recently, and pheasants are also pretty frequently flushed in the neighbourhood of that township. The goldfinches, either some of those liberated four years ago, or their progeny, are also occasionally met with, and that they are breeding is proved by the circumstance that a nest with four eggs was recently taken in mistake for that of a native bird.

AT Oamaru, New Zealand, says the *Southern Mercury*, a harbour light was displayed for the first time on December 1 last. It is visible for fifteen miles, and is situated on the point of a bluff above the harbour at an elevation of 160 feet. The lantern is of an octagonal shape, five sides being glazed, so that the light can be seen from N.W. to S.W.

THE same paper says that there is a chance of the *vignerom* industry being established on the west coast, as 200 two-year-old grape-vines, designed to form the nucleus of a vineyard, have been imported to the Lake Brunner district, to the order of an Italian settler, who, it is hardly necessary to add, understands their culture thoroughly, and is fully satisfied that they will flourish well in that locality.

THE ROYAL HISTORICAL AND ARCHAEOLOGICAL ASSOCIATION OF IRELAND.

THE January meeting of this Association was held on the 20th ult. at Butler House, Kilkenny. The annual report shows that there has been an accession of forty-two members and four fellows during the past year, and that the publications of this Association are in great request with the public. Several objects were presented to the museum, including bronze celts and spear-heads, an oaken paddle found with a single-tree canoe near Inniskillen and an Abyssinian MS. A fine specimen of the archaeological mare's-nest was destroyed by Mr. Hewson, in reference to a silver pin having a coin for a head. The coin had been identified by an eminent numismatist as belonging to a kind called *scattae*, of Danish, or at all events Northern origin, and had been consequently engraved in the last number of the Journal. Mr. Hewson subsequently compared the coin with others in his own collection, and has ascertained that it is a comparatively modern East Indian piece. Mr. Prim communicated a description of a stone-roofed oratory near the Abbey of Louth, which seems to have been hitherto unnoticed. The local legend ascribes its origin to miraculous power. St. Mochta, a contemporary of St. Patrick, while walking in the fields near the Abbey, fell into a state of ecstatic contemplation, which lasted for 100, or, as some versions of the story say, 300 years. On coming to himself he returned to the Abbey, and was, naturally enough, refused admission. He accordingly went to sleep in the open air, and in the morning this building was found raised over him. It consists of two storeys, connected by a staircase in the thickness of the wall; and is therefore not so old as the similar structures at Kells, Killaloe, and Glendalough, in which the only means of access to the upper room was by a ladder and a hole in the floor.

In the Journal of the Association for the past year, there is an account, illustrated by engravings from photographs, of the shrine of St. Manchan, which was exhibited at the Dublin Exhibition in 1872. This curious relic is preserved in the Roman Catholic chapel at Lemanaghan, and the peasantry in the neighbourhood are accustomed to swear by it, or by the bones of the saint, which are said still to rest there. The shrine is formed of yew boards in the shape of a high-pitched gabled roof, about two feet long. On each side is a Greek cross, of bronze, with bosses at the ends of each limb and in the centre, enriched with interlaced ornaments, the interstices filled in with enamel. The borders are composed of similar work. But the most remarkable feature in this ancient work of art is a row of bronze figures in high relief, placed in the spaces formed by the arms of the cross. Originally there were, on both sides, about fifty of these figures, but now only ten remain. They wear ornamental kilts and jackets, and hold swords or other weapons in their hands. As representations of the human figure they possess but little merit, and contrast strangely with the beautiful design and workmanship of the more decorative portions of the shrine. The Rev. James Graves has identified two similar figures—one in the possession of the Royal Irish Academy, and the other in private hands—as having formerly belonged to the shrine, and hopes that others may yet be discovered. One of these represents a bishop holding a pastoral staff, while all the figures still *in situ* are clad in the costume of the laity.

Mr. Wakeman contributes the results of a careful examination of the round tower at Devenish, the model round tower of Ireland. Though not the largest tower in Ireland, being only 84 feet 10 inches in height, it is distinguished from all its compeers by the beauty of its masonry, and especially by the ornamental cornice which underlies the conical roof. This cornice is decorated partly with a Romanesque scroll and partly with rows of discs, standing out in low relief; and over the four highest windows are four

heads, three with beards interlaced after the fashion so commonly seen in Irish MSS., but the fourth beardless. Mr. Wakeman conjectures that these sculptures represent Saints Patrick, Columba, Molaise, and Bridget, but gives no reasons for his conjecture. His remarks are illustrated by a view of the tower and by drawings of the cornice and other portions of the building. The Journal contains many other papers of great interest and value, which we have no space to notice here; especially one by Mr. G. M. Atkinson on "Ogham Writing," illustrated by facsimiles from several MS. treatises. Everyone who takes any interest in the Ogham inscriptions (and considering the numberless discussions to which they have given rise, all antiquaries must do so to some extent) will do well to study this paper with care.

RECOLLECTIONS OF MR. FINLAY.

MR. FINLAY was of Scotch extraction. I have reason to think that he studied in Germany in his youth. He came out as a volunteer in the Greek Revolution, when he became acquainted with Lord Byron, who said to him, on being introduced, "You are young and enthusiastic, and therefore sure to be the more disappointed when you know the Greeks as well as I do." Mr. Finlay attained the rank of colonel in the course of the war, and, after the establishment of Greek independence, believing in the future of the new-born country, purchased land in Attica, an investment which obliged him constantly to reside at Athens, as the collection of rents, paid under the *metairie* system in kind, involved that personal surveillance which could not be safely delegated to another. This enforced exile, if not to his own advantage, was turned to good account by him in the interests of literature. After making himself thoroughly acquainted with the modern Greek language and with most of the countries which formed part of the Byzantine Empire, he composed his History of the Greeks from the Macedonian period to the present day, a work which in every page shows not only the ripe learning and conscientious and impartial judgment of the author, but also that minute and far-ranging local knowledge of the countries of which his History treats which could only have been acquired by travel and long residence. One of the most interesting of his tours was one in which he accompanied Karl Ritter in a cruise through the Archipelago.

Mr. Finlay took an active interest in the political affairs of Greece, and the letters which he contributed as *Times* correspondent for many years show how thoroughly he appreciated the people among whom his exile was passed.

It could hardly be said of his account of Greek politicians that he was "to their virtues very kind, and to their faults a little blind." He told the truth about Greece fearlessly, and with no tinge of partisanship, and it is to the credit of the nation that they appreciated his impartiality; and all through their many political vicissitudes respected the one foreigner who, living in their midst, had the courage to tell them of their faults.

Of Mr. Finlay it may be said that though he passed a lifetime in the Levant, he never became a Levantine. He was every inch an English gentleman from the beginning to the end, and his loss will be deeply felt by all of his countrymen who have had the advantage of enjoying at Athens his genial hospitality and instructive society.

CORRESPONDENCE.

THE CENTURIE OF PRAISE.

4 Victoria Road, Clapham, S.W.: Feb. 9, 1875.

Will you allow me to correct an oversight in my article on Dr. Ingleby's *Centurie of Praise*? I said that Shakspeare's name does not occur (except after his death), in the greater writers of the day. Among these I mentioned Webster. Webster is, however, a very significant exception to my generalised statement, as is shown by an extract, dated 1612, given by Dr. Ingleby, p. 45. The extract was new to me, and I overlooked it.

R. SIMPSON.

IRISH TEXTS.

Stonyford, Ireland: Feb. 8, 1875.

Some time since a correspondence relative to the formation of an "Irish Text Society" was commenced in the columns of the *Athenaeum*. The projected society was to issue, for the use of students, the texts of ancient Celtic MSS.; and that there are practically unlimited materials any one who has read Professor O'Curry's *Lectures on the Manuscript Materials of Irish History* must allow. The projector or projectors of this new society seemed, however, to forget that there was already an organisation in existence for the same purpose, which only wants support to make it able to supply Irish texts in abundance. I allude to the Irish Archaeological and Celtic Society, whose noble rank of volumes, the Irish texts edited by O'Donovan, O'Curry, Todd, Reeves, and Whitley Stokes, are before me. I would also call attention to the Irish texts placed within the reach of Celtic students by means of the publications of the Royal Historical and Archaeological Association of Ireland, of which I have the honour to be Secretary. Besides several important tracts from the *Leabhar na Huidri* and *Book of Ballymote*, printed in the quarterly *Journal of the Association*, I would allude to the *Corpus Inscriptionum Hibernicarum*, forming its annual volume, which has been issuing in quarto yearly parts commencing with 1870, and has now reached the second volume. These lapidary texts are amongst the most ancient we possess; and as they are not only printed under the care of the best Irish scholars, but also facsimiled in numerous plates by the accomplished editress, Miss M. Stokes, they may be depended on as very valuable, not only in an artistic point of view—and many of them are exquisite examples of Celtic art—but also as forming the most trustworthy Irish texts we possess.

JAMES GRAVES, A.B., M.R.I.A.

AN UNPUBLISHED LETTER OF COLERIDGE.

The following letter of Samuel Taylor Coleridge, the original of which is in my possession, will, I think, prove interesting to many readers of the *ACADEMY*. It belongs to a large collection of autograph letters bequeathed by the late John Kenyon to Mr. James Booth, to whose kindness I am indebted for it and many others. It is addressed on the cover, "J. Kenyon, Esq., 9 Argyle Street," and bears Mr. Kenyon's endorsement, "Letter to me from Coleridge, autograph."

R. CHILDERS.

38 Clanricarde Gardens.

"Nov. 3, 1814.

"Mr. B. Morgan's.* . . .

"My dear Sir,—At Binns's, Cheap Street, I found Jer. Taylor's Dissuasive from Popery, in the largest and only complete Edition of his Polemical Tracts. Mr. Binns had no objection to the paragraph † being transcribed any morning or evening at his House: and I put in a piece of paper with the words at which the Transcript should begin and with which end—P. 450, line 5th to P. 451, l. 31—I believe. But indeed I am ashamed, rather I feel awkward and uncomfortable at obtruding on you so long a task—much longer than I had imagined. I don't like to use any words that might give you any unpleasure, but I cannot help fearing that like a child spoilt by your and Mrs. Kenyon's great Indulgence I may have been betrayed into presuming on it more than I ought.—Indeed, my dear Sir! I do feel very keenly how exceeding kind you & Mrs. K. have been to me—it makes this scrawl of mine look dim in a way, that was less uncommon with me formerly than it has been for the last 8 or 10 years. But to return, or turn off to the good old Bishop. It would be worth your while to read Taylor's letter on original sin, & what follows. It is the masterpiece of Human Eloquence. I compare it to an old Statue of Janus, with one of the Faces, that which looks toward his opponents, the controversial Phiz, in highest Preservation—the face of a mighty one, all Power, all Life!—the Face of a God rushing on to Battle; and in the same moment enjoying at once both Contest and Triumph. The other, that which should have been the Countenance that looks towards his Followers—that with which he substitutes his own Opinion—all weather-eaten, dim, noseless, a *Ghost in Marble*—such as you may have seen represented in many of Piranesi's astounding Engravings from Rome & the Campus Martius. Jer. Taylor's Discursive Intellect dazzled-darkened his Intuitions—: & the principle of becoming all Things to all men if by any means he might save any, with him as with Burke, thickened the protecting Epidermis of the Tact-nerve of Truth into something too like a Callus. But take him all in all, such a miraculous Combination of Erudition broad, deep, and omnigenous, of Logic subtle as well as acute, and as robust as agile; of psychological Insight, so fine yet so secure! of public Prudence and practical *Sagacity* that one ray of *creative Faith* would have lit up and transfigured into Wisdom; and of genuine Imagination, with its streaming Face unifying all at one moment like that of the setting Sun when thro' one interspace of blue Sky no larger than itself it emerges from the Cloud to sink behind the mountain—but a face seen only at starts, when some Breeze from the higher air scatters for a moment the cloud of Butterfly fancies, which flutter around him like a moving Garment of ten thousand colors—(now how shall I get out of this sentence? The Tail is too big to be taken up into the Coiler's mouth)—well, as I was saying, I believe, such a complex man hardly shall we meet again.

* Here follows a word which is quite illegible.

† The symbol § is used for this word.

"You may depend on the Wakefields (crepitu post Tonitrua! fœtor articulatus post fragrantia murmura, et musicos odores Zephyrorum e paradiso) on Tuesday. I shall fag all to-night & tomorrow at him—and shall try my hand at a review.—Aid me, butcherly Muses! and sharpen on your steel my cleaver bright & keen.

"May God bless you & yours!

"Your obliged,

"S. T. COLERIDGE.

"P.S. My address after Tuesday will be (God permitting) Mr. Page's, Surgeon, Calne."

POUR LE MÉRITE.

London, Arts Club : Feb. 9.

A paragraph appeared in the ACADEMY of last Saturday in which it is stated that the "*Ordre pour le Mérite*" is not given by the Sovereign or minister, but by the Knights themselves." Will you grant me a little space to enable me to point out that this statement is erroneous? The statutes of the Order (*Gesetz-Sammlung für die königlichen Preussischen Staaten*, No. 16, of May 31, 1842) are now lying before me, and paragraph 5, which deals with elections, enacts, that although, in the case of a vacancy occurring among the thirty knights (of either branch), the remainder may present a candidate for the royal approval, yet the King reserves the right of nominating a fresh knight, to fill up the vacancy, out of such eminent men in science and in art as he, the King, may consider suitable candidates. The royal right of nomination, as well as of approval, is expressly reserved. A glance at the paragraph in question (which I should be happy to lay before you) will convince anyone that the Sovereign possesses the right of nomination without consultation with the other knights. Now to apply this fact to the nomination of Mr. Carlyle. When I was, last year, in Berlin, I was assured, on the best authority, that a well-known and very distinguished German gentleman, who is thoroughly acquainted with England and with English literature, had suggested the historian of the Hohenzollerns to Prince Bismarck, who, in his turn, submitted the suggestion to Kaiser Wilhelm, by whom our Carlyle was nominated a knight of the Order.

It is reported that Mr. Carlyle has declined the Grand Cross of the Bath; but it seems certain that he did not refuse the *Ordre pour le Mérite*.

I may just add that the latter order was created by Frederick the Great, in 1740, in order to reward distinguished service in the field against the enemy; and that Friedrich Wilhelm IV., on the 102nd anniversary of the great Frederick's accession, added to it a *Friedens-Klasse*, which is intended as an honour for native and foreign men of distinguished eminence in science and in art. Mr. Carlyle has, of course, been nominated by the Emperor a knight of the *Friedens-Klasse*.

H. SCHÜTZ WILSON.

OUR OLDEST MS., AND WHO MUTILATED IT.*

St. Beuno's College, St. Asaph : Feb. 2, 1875.

I beg permission to make a few remarks on the interesting discussion which is now being carried on respecting the Canons of Sardica and the Bodleian MS. of the *Prisca Versio*.

1. Seven leaves were cut out of the MS.; four have been replaced; the contents of two only were printed by Voel and Henri Justelle. It is reasonable to conclude that the leaves were cut

* The following paragraph, which should have appeared as a postscript to Mr. Renouf's letter of last week, reached us too late for insertion:—

"I have ascertained" (writes Mr. Renouf) "that the preface on p. 276 is printed on a leaf inserted in place of another which has been cancelled. The traces of cancelling are very visible in the British Museum copies. In the copy at Sion College, the leaf which stood before the cancelled one has got out of its place and is bound after p. 278."

out by those who replaced them. Now these leaves were in the possession of the Justelle, and not of De Marca.

Here is the proof of it. The younger Justelle printed two leaves, and at the time he did so he was in ignorance of what the next two leaves contained. He conjectured that the Canons of Laodicea were on those leaves; not knowing, as the Ballerini point out, that Laodicea had no place in the *Prisca*. The two unprinted leaves were, then, mislaid, when Henri Justelle published the *Bibliotheca Juris Canonici Veteris* in 1861, but they were found before he gave the MS. to the Bodleian in 1875. Found by whom? Can it be supposed that De Marca had anything to do with these leaves? Evidently Justelle the younger found them among his father's papers. Where these were mislaid and afterwards found, the three leaves now lost will have been mislaid also, and with this De Marca is clearly not concerned.

2. It is deserving of remark that we have here a corroboration of the accuracy of Baluze. He said that two leaves were produced before the publication of the book. Having four in the MS. now, we might wonder why but two were then produced, if we did not know from Justelle's conjecture as to the contents of the other two, that he had not seen them then, but had found them since.

3. The character of Voel and Justelle is cleared from the imputation of "printing but two leaves when they had four, and letting the other three be lost." As they had not seen the two that were not printed, they cannot be held responsible for the loss of the other three.

4. Mr. Ffoulkes regards it "as morally certain that the canon wanting in this MS. . . is that canon which Pope Zosimus quoted to the Africans." Which is that canon? Pope Zosimus in his *Commonitorium* quoted two. What becomes of Mr. Ffoulkes' argument unless both of these canons were absent from "our oldest MS.;" and if this is to be said, what becomes of the argument from the numbering of the canons?

5. Mr. Ffoulkes' theory is, that the Africans looked over the Canons of Sardica, but could not find that quoted by Zosimus, and he thinks that if he had the missing leaves of Justelle's MS. he would find the same deficiency there. He therefore maintains that the Africans were acquainted with the Canons of Sardica. If they were, why do they say that they have sent to the East for genuine copies of the Council of Nicea? If they knew that it was a question of a canon of Sardica, they did not need to ask for those of Nicea.

And if the African bishops knew quite well all about the Council of Sardica, how came St. Augustine, who was one of them, to know only the Council of Philippopolis under that name, and that only when a Donatist had shown him a copy?

JOHN MORRIS, S.J.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Feb. 13,	3 p.m.	Royal Institution: Mr. J. T. Wood, II.
		" Crystal Palace Concert (Bilkow).
		" Saturday Popular Concert, St. James's Hall (Mdlle. Krebs).
	3.45 p.m.	Royal Botanic.
	8 p.m.	Royal Albert Hall: Ballad Concert.
MONDAY, Feb. 15,	3 p.m.	Asiatic.
	5 p.m.	London Institution: Dr. Carpenter on "Physical Geography of the Deep Sea."
	7 p.m.	Entomological.
	8 p.m.	Medical. British Architects.
		" Monday Popular Concert, St. James's Hall (Bennett Night).
TUESDAY, Feb. 16,	3 p.m.	Royal Institution: Mr. E. Ray Lankester, III.
	7.45 p.m.	Statistical: Mr. C. Gatiloff on "Improved Dwellings, their Beneficial Effect on Health and Morals."
	8 p.m.	Civil Engineers. Pathological.
		" Royal Albert Hall: Orchestral Concert (Wilhelmj).
	8.30 p.m.	Zoological.
WEDNESDAY, Feb. 17,	1 p.m.	Horticultural.
	7 p.m.	Meteorological.
	8 p.m.	Society of Arts.
		" London Ballad Concert, St. James's Hall.

THURSDAY, Feb. 18,	3 p.m.	Royal Institution: Professor Tyndall, III.
	4 p.m.	Zoological.
	6.30 p.m.	Royal Society Club.
	7 p.m.	London Institution: Second Musical Lecture, by Professor Ella Numismatic.
	8 p.m.	Society of Arts: Dr. Zerffi on "English Sculpture."
		" Chemical: Professor Clark Maxwell on "The Dynamical Evidence of the Molecular Constitution of Matter."
		" Linnean.
		" Mr. H. Leslie's Choir, St. James's Hall.
	8.30 p.m.	Royal. Antiquaries.
FRIDAY, Feb. 19,	1 p.m.	Geological: Anniversary.
	8 p.m.	Royal Institution: Weekly Evening Meeting. 9 p.m. Professor Frankland on "River Pollution."
		" Philological: Mr. Mendes on "The Pronunciation of Young Children;" Professor Aufrecht on "Ocean and Umbrian;" a Paper by Dr. J. A. H. Murray.

SCIENCE.

Economic Geology. By David Page. (London and Edinburgh: Blackwood & Sons, 1874.)

It is a matter of regret that the excellent design of this work should have been marred by faulty execution. Professor Page evidently sees with clearness the distinction between scientific and applied geology, and therefore knows what subjects should be discussed in a book like that before us. But we are compelled to say that the present compilation is of very small value, chiefly by reason of its general inaccuracy, although its slovenly style is another drawback. As the author, in his preface, solicits corrections and suggestions, we will point out in some detail the most serious errors of the book, in the hope that while justifying our critical verdict we may aid in the improvement of another edition. Passing over the introductory chapter, on the "Aim of Economic Geology," we find a description of the "Nature and Arrangement of Rock-Formations," which, though of necessity brief, is satisfactory in so far as it is geological, but which teems with errors on chemical and physical matters. For instance, on page 12 we are presented with a table of specific gravities, the numbers being given to three places of decimals, and yet, with this appearance of an unattainable precision, we find beryl set down as 3.549 instead of 2.7; while sapphire figures as 4.2, and topaz as 4.066, both these numbers being much above the truth. But a more serious error is to come. On page 14 is a list of "chemical elements" which will shock all chemists. For the long-banished element pelopium still holds its place in Professor Page's catalogue, together with ilmenium and terbium, while indium and rubidium are omitted.

The third chapter, treating of soils and manures, might perhaps have been expanded with advantage, but it is certain that the paragraphs concerning manures require much revision. For instance, some analyses of guano are quoted on page 46, but they are too imperfect to be of any service, since they do not give the percentage of nitrogen, the most important ingredient of this manure, while they are so old as to possess an antiquarian rather than a scientific or economic interest. In Professor Page's account of saline manures (p. 47), no student would be

able to discern the paramount importance of nitrate of soda, for which compound alone the *salinas* of South America are worked. This salt occupies the thirteenth place in our author's list of the products of the *salinas*—it ought to have been put first; while the statement on page 48 about the annual exportation (from Peru) of many thousand tons of "crude salts" should have included some information as to the fact that these crude salts are nearly pure nitrate of soda.

The subject of the valuation of land from a mining or agricultural point of view is not adequately treated in the seven pages here given to this department of Economic Geology; but the three succeeding chapters, on "Geology in relation to Architecture and Civil Engineering," are more satisfactory. The minor subjects under the above heads are numerous, including building stones, decorative stones, and marbles, cements, mortars, concretes, artificial stones, road, railway, and canal making, as well as dock and harbour construction and water-supply.

Chapter viii. contains a condensed account of mine-engineering, quarrying, mining, and placer-working, while the next chapter is devoted to heat and light-producing materials. Some of these subjects are fairly treated, considering the small space that could be assigned to them; but here and there we notice slips requiring correction, such as the confusing of native naphtha with coal naphtha on page 170.

Two of the sections of chapter x. are respectively entitled "The Clays we Fabricate," and "The Sands we Vitrify"—expressions which recall those employed in Johnston's *Chemistry of Common Life*, but are certainly less felicitous. We must demur to the statement on page 184: "In general, the kaolin or china-clay is a product of natural decomposition; but at Belleek, it is obtained by calcining the red orthoclase granite of the district." No calcination can remove the 12 or 14 per cent. of alkali from orthoclase felspar, or change it into a substance which can be substituted for clay as an ingredient of porcelain.

Grinding, polishing, and cutting materials are described in chapter xi., and fire-resisting substances and mineral paints in chapters xii. and xiii. The chemistry of the succeeding chapters (xiv. to xviii.) is often at fault, while the most complete confusion prevails as to the thermometric data introduced, and the use of the litre, the gallon, &c. Here are a few instances of such defects. On page 250, sea-water is said to contain but 66.47 per cent. of water; on several following pages, dozens of analyses of mineral waters are tabulated, without any statement as to whether the figures given represent grains per gallon, grains per litre, or parts in 10,000. Silver is said, on page 311, to melt at 1,000° Fahrenheit; while rubidium, mentioned on page 310, is stated to be as soft as wax at 0.10°—whatever that may mean.

We are sorry to have been obliged to express an unfavourable opinion of Professor Page's last book. If the scope of his work rendered a somewhat superficial treatment of his subject necessary, the author might at least have secured accuracy in his state-

ments and figures. Before the volume can be of real use to students of Economic Geology, it must be subjected to a thorough revision.

A. H. CHURCH.

Ewald's Biblical Theology of the Old and New Testaments. ["Die Lehre der Bibel von Gott, oder Theologie des A. und N. B." Von H. Ewald.] Third Volume. (Leipzig: Vogel, 1874.)

PROFESSOR EWALD'S writings are always difficult to criticise, for they are distinguished, as the Germans say, by an essential characteristic of Revelation: they must be received either with faith or with unbelief. This is peculiarly the case with the volume now before us. As the author unfolds his system of Christian Gnosis, we are often called upon to dissent from the way in which he uses a text, or represents a Biblical notion. But it is impossible to make our dissent the starting-point for a critical examination and modification of his view. The reader may say, "I do not believe this;" but he can never venture to say that a different apprehension of this or that Biblical detail would probably have modified the tenor of the author's teaching. For that teaching is always set forth as possessing a kind of *a priori* evidence of its own, so that it is hard to say whether the agreement between the Bible and Professor Ewald adds more to the authority of the latter or of the former. Thus, when at p. 303 the author concludes his remarks on faith, hope, and love, he observes in a footnote, "that it was purely by the attempt to find a right arrangement for the topics belonging to this section, that he was originally guided to these three forces, and that it was not till afterwards that he thought of the part they play in the writings of Paul." This is the more interesting, because we have just read on the preceding page that only one of Paul's creative intuitions into the essence of all true religion could have led the Apostle to what he says on this subject.

But apart from the fact that Professor Ewald never condescends to argue in favour of his views, or even to state them in a form which invites argument, the volume before us presents special difficulties to the critic by the extremely perplexing arrangement of the material. The completion of the *Glaubenslehre*, or systematic statement of Christian faith, ought to be an appropriate point for looking back on the three bulky octavos now in the hands of the public, and forming some general conception of the structure of the author's theological views. But the three-fold division under which Professor Ewald proposes to unfold his conception of the Biblical system is so framed that it is impossible to form a final judgment on the *Glaubenslehre* till we have in our hands the doctrine of the Kingdom. And this doctrine forms the last division of the work, so that our judgment must remain in suspense probably for some years. After all, it is somewhat doubtful whether, when it does appear, the doctrine of the Kingdom will supplement the present volume to the requisite extent. As matters stand at present, the whole circle of ideas connected with the Atonement has received a most perfunctory treatment, the Biblical conception of the work of Christ

forming only a secondary feature in the delineation of the gradual development in the minds of the New Testament believers of a transcendental conception of His Person and cosmical significance. One of the most important ideas which this treatment slurs over is that of mediatorship, and for this we are expressly referred to the doctrine of the Kingdom. Whether other equally important elements of the New Testament faith are to receive in another place the full discussion which one naturally expected to find in the *Glaubenslehre*, it is impossible to say. If they do not, the work, in spite of its great size and diffuse treatment of certain topics, will be a most imperfect system of Biblical Theology, and in particular will contrast very unfavourably with such thoroughly substantial discussion of Biblical problems as occupies the second volume of Professor Ritschl's recent great work. We suspect, indeed, that the only parts of doctrine which draw out Professor Ewald's full interest, and exercise all his strength, are those that belong to the metaphysico-religious theory of the universe. He is extremely fond of comprehensive speculative notions, and the whole book is very much shaped by the influence of certain abstract principles, which are speculative rather than Biblical. The doctrine of sin, for example, is dominated by the principle that at every stage in the development of the purpose of the universe, all creation, including mankind, is perfect in itself, and in harmony with its divinely appointed end. The Christology, again, is guided by the idea that Christ appears in the midst of the development of history as the necessary fruit of a single consistent evolution; so that if it were possible for the human race to begin its course again from the first, history would repeat itself in all essential points, a new Christ would be born as Son of God, be crucified, and rise again (p. 409). Surely conceptions like these belong to a branch of theological speculation, which cannot without the greatest confusion be allowed to present itself under the form of Biblical Theology.

The defects which we have endeavoured briefly to indicate have made our perusal of the new volume not a little disappointing. One has long been accustomed to tolerate and almost to admire Professor Ewald's peculiar style of investigation, in consideration of the enormous value of the results. In the present volume we have every familiar fault of method in an exaggerated form, and after all we find no available material on the very topics on which we were most anxious for new light. It is only fair to add that the reader who is content to relinquish the expectation of finding a uniform and satisfactory treatment of all Biblical questions will find in the volume several individual discussions that are both interesting and valuable. To those who are not already familiar with the papers on the narrative of Creation in Genesis which appeared long ago in the author's *Jahrbücher*, the treatment of this subject will probably be the most interesting part of the volume; and as Professor Ewald's rendering of the first verse of Genesis is so constantly appealed to by opponents of the doctrine of Creation out of nothing, it is likely that many readers will

be surprised at the decided way in which he rejects the notion of pre-existent Chaos as inconsistent with the Biblical idea of God. The most characteristic part of Ewald's doctrine of creation lies, however, in his treatment of what he calls the five co-creative powers, viz., the Spirit of God, the Man of God, Wisdom, the Son of God, and the Logos. This is a very ingenious part of the volume, though what is said of these contains a great deal of fanciful matter, and in particular the curious speculation as to the ideal man, the heavenly Messiah, who is supposed to have formed the subject of a separate book as early as the seventh century B.C., finds but scanty foundation in Prov. xxx. 4. The account of the doctrine of the Fall rests in a great degree on the same series of essays as has supplied valuable matter for the doctrine of creation. The remaining parts of the doctrine of sin are exceedingly confused and uninteresting, while the next part of the volume, the general survey of the way of man's return to God, is, as has been already said, disappointingly meagre in its treatment of the most important notions. Only six pages are devoted to the whole subject of repentance and regeneration, and in these the only point of special interest is the philological discussion, in a footnote, of the words for repentance. In the Christology it is interesting to observe the stress laid upon the descent into Hades; but the real value of this part of the volume lies in a well-drawn sketch of the gradual development in the New Testament of the ideal conception of Christ. It is true that on such a subject one had a right to expect more than a mere sketch, but the only way to profit by the writings of Professor Ewald is to accept without complaint whatever he offers. From this sketch of "Faith in Christ," which, however, treats rather of *fides de Christo* than of *fides in Christum*, we are carried on to the question of "Faith in the Holy Ghost," and to a peculiar reconstruction of the doctrine of the Trinity, which may be illustrated by a single quotation:—

"Historically considered, the whole development of all true religion closed in the middle of the ages, when in and along with the manifestation and glorification of Christ the pure divine power of the Holy Spirit finally reached its fullest recognition and operation, and when these two powers, as the eternal powers of divine Revelation in time and creation, were allied with God as Creator and Revealer, and so the circle of powers was closed which co-operate in guiding man to his ultimate destiny in creation. The scholastic terms of a divine Trinity and a triune God are not Biblical, but they express the perfectly true notion that the same self-creative supernatural power which is in God exists also in a different grade and manner in the Logos, as the glorified Christ, and in the Holy Spirit, and that thus both Logos and Spirit may in this sense, and in accordance with their eternal essence, be felt and thought of as God . . ." (p. 418.)

Decidedly interesting is the last part of the volume, which discusses the doctrine of immortality together with the Biblical eschatology.

In closing this notice, we may observe that a good many corrections or modifications of the author's published views on individual passages occur throughout the

volume. The most remarkable of these refers to the 8th Psalm, where Professor Ewald now understands מַלְאָכִים to mean "high angels." W. ROBERTSON SMITH.

Catalogue of the Collection of Oriental Coins belonging to Colonel C. Seton Guthrie, R.E., Fascicul. I. Coins of the Amari Thalifehs. By Stanley Lane Poole. (Stephen Austin, 1874.)

THE passion for making collections of Greek and Roman coins, which was already kindled in Germany in the sixteenth century by Peutingering and the Fuggers in Augsburg, has extended itself to Oriental issues only in recent times; Oriental Numismatics is a young science. It is to such a degree in arrear as compared with classical numismatics, that whilst some 80,000 coins of the latter class are known, there are about eighty purely Mohammedan dynasties of which as yet no coins have come to our knowledge. Colonel Seton Guthrie's Oriental collection must be counted among the most remarkable and the most valuable private collections in existence.

As an example of the richness of his cabinet, we may mention that in the Marsden collection there were only fifteen specimens of Omeyyade coins, in the Milan collection described by Castiglioni twelve pieces; in the St. Petersburg collection, as appears from Fraehn's *Recessio* seventy-eight pieces; in the Stockholm collection, according to Tornberg's *Numi Cyfici*, about sixty pieces; while the catalogue before us presents no fewer than 204 specimens of the Omeyyade dynasty in gold and silver alone, not to mention the copper—a number which even the grand-ducal cabinet of Jena does not quite come up to. Among the mintplaces those of which but few examples are as yet known are tolerably numerous; but there are no fewer than thirty-eight *Inédites*.

We have compared the excellent photographic representations of the coins on the five accompanying plates, and have found the rendering of the legends in the text of the catalogue perfectly correct. Mr. L. Poole has been particularly careful in rendering the presence of diacritical points (the value of which for Arabic palaeography is so great), and the marginal ornaments of the different specimens, although he restricts himself in other respects to the shortest possible description of the separate pieces. The references to the corresponding coins in Tiesenhansen's newly published work on the Coins of the Khalifs suffice for further information. How important, however, and useful is an attention to those ornaments, overlooked by older numismatists, will at once appear by an example of this catalogue. Under the no. 125 is placed a dirhem of the year 131 of the Hidschra, of which the mintplace *al-Samijah* or *al-Schamijah* is not mentioned even by the most complete Arab geographers. Another example of the same coin is in the cabinet of Jena, and a third has been shown to me from the collection of Dr. Imhoof-Blumer, of Switzerland. I should have supposed that *al-Salamijah*, the name of a well-known town in the neighbourhood of Mossul (*Marasid*, &c.), was the reading on the coins, if on the Jena specimen, as well as on Colonel Guthrie's, the *alif* had not been perfectly and clearly separated from the following *mim*. Now, however, the coin bears precisely the same ornaments (five double annulets on the obverse and five single annulets on the reverse) as occur only on the coins of Kufa (see no. 130) and Wasit (see no. 201) of the same time; and so one is entitled to suppose that the situation of the unknown *al-Schamijah* was in the neighbourhood of one of these two cities. On no. 118, struck at Sarakhs, one of the jewels of the cabinet, it should be observed that Tornberg has described a coin of this mint in the *Revue de la Numismatique Belge* (5 sér. iii. p. 3), and that according to Dr. Mordtmann's letters a similar piece is preserved in the cabinet of Subhi Pasha at Constantinople.

On one point we differ from Mr. L. Poole. Without controverting the utility of placing together all the coins belonging to the same mint-place, it yet appears to us inadmissible to class this series of mints according to the purely outward and accidental characteristics of the initial letter, quite without reference to their geographical position. As the importance of coins is mainly as historical and geographical monuments, it seems to me that these two principles ought to be maintained together in the arrangement of a cabinet.

G. STICKEL.

SCIENCE NOTES.

PHYSIOLOGY.

Decussation of Nerve-fibres in the Optic Chiasma.—It was long ago laid down by Johannes Müller, on *à priori* grounds, that decussation of the optic nerve-fibres must be complete whenever the field of vision of each eye is independent of that of its fellow; incomplete, when the two fields coincide. In man and the higher mammals, the chiasma is usually said to consist of anterior commissural fibres passing between the two retinae, posterior commissural fibres passing from one optic tract to the other, fibres passing from each optic tract to the nerve of the same side, and fibres crossing to that of the opposite side. In the lower vertebrata, complete decussation is recognised as the rule. Recently, however, it has been asserted by Mandelstamm, Biesiadecki, and others, that complete decussation occurs in the chiasma of the dog, the ape, and the human subject also. Professor Gudden, of Munich (*Gräfe's Archiv.*, Bd. xx., Abth. 2) has endeavoured to decide the point both by anatomical and by experimental means. He confirms the existing statements on the complete decussation of the fibres in fishes, amphibia, and birds (pigeons and owls). The chiasma of the rabbit follows the same law. But in the dog, the monkey, and in man, the crossing is incomplete. The evidence afforded by examination of successive horizontal sections of the chiasma made with the microtome, is not absolutely conclusive on this point; it is enough to show, however, that there is no anterior commissure in the dog, and probably in man also; the posterior commissure being well marked. The strongest part of the evidence as to decussation is experimental. It is a well-known fact, that if the retina be destroyed, atrophy of the optic nerve and of the centres with which it is connected follows; a similar atrophy of the nerve may be produced by destruction of its central organ, leaving its peripheral expansion untouched; only in this case the retina retains its characteristic structure, except as regards its fibrous layer. It seems to be a law of very general application throughout the nervous system, that when two organs are connected by nerve-fibres, the destruction of either of the two entails atrophy of the conductor; but that it is only when the excitant organ is damaged that consecutive atrophy of its fellow ensues. Gudden removed either one or both eyeballs from rabbits and dogs at birth, and examined their brains when they were full-grown. In the rabbit, when both retinae had been destroyed, a complete symmetrical atrophy of nerves and nerve-centres was found, the nerves consisting solely of neurilemma and the optic tracts being entirely absent, while the posterior commissure remained unaltered. (From this the author concludes that the posterior commissure is wholly cerebral, and has no connexion whatever with the visual function). When only one eye-ball had been removed, the corresponding nerve was reduced to a fibrous cord, the optic tract of the opposite side was invisible, and the centre shrivelled; the other nerve, tract and centre being of normal size. In dogs, the removal of both retinae gives the same appearances as in the rabbit; but after removal of one eye-ball only, the nerve on that side is found withered, while the optic tracts are both present.

both somewhat smaller than usual, the one on the side opposite to the injury being the smaller of the two; now if the decussation had been complete, it would have been wholly wanting. Further, both centres were somewhat wasted, the difference between the two sides being rather indistinct, not well-marked, as in the rabbit. Hence it may safely be concluded that partial decussation does occur, and that—in the dog—the crucial fasciculus exceeds the lateral one in size. Precisely similar results were obtained by destroying the centres on one side at birth instead of removing the peripheral expansion of the nerve.

Contest between the Retinae.—An attempt is made by Schön and Mosso (*Ibidem*) to explain the fact that if one eye be closed, while the other is directed, without fixation, towards a surface of uniform tint (such as the open sky, or a blank wall), a temporary dimness seems to invade a part of the visual field of the uncovered eye. This obscuration is intermittent, taking place from five to twelve times in a minute; the number being tolerably constant for the individual observer. The duration of the dimness varies inversely as its frequency. It may be of a greenish-yellow or bluish tint, or it may not exhibit any definite colour. The phenomenon is explained by supposing that our attention is directed to each retina in turn, that there is a contest between them; about seven-tenths of our time being given to the retina of the uncovered eye, while three-tenths are diverted to that of the closed one. This explanation is supported by the following facts. The phenomenon only occurs during monocular vision, and is unknown to the one-eyed. It is limited to that part of the visual field which is common to both eyes. When the attention is concentrated on the uncovered eye by setting it some task, such as that of counting spots on the wall, the dimness does not occur. Lastly, when the eyes are unequal in power, and one eye is habitually used while the images formed on the retina of the other are as habitually suppressed (as in some cases of squint), the phenomenon cannot be produced. Whether the obscuration depends on a momentary blending of the two fields, or on a total diversion of the attention to the closed eye, it is not easy to decide. The circumstance that the outer region of the field remains distinct would seem to indicate that the former view is the correct one, since impressions on the independent region of the uncovered retina continue to be transmitted to the sensorium.

Changes in the Blood during its passage through the Spleen.—Picard and Malassez (*Comptes Rendus*, December 21, 1874), have investigated this point in relation to the red corpuscles. Their number is usually said to be diminished in the blood of the splenic vein (Béclard, Gray). The present enquirers employed two methods of investigation: actual numeration of the corpuscles, and the determination of the respiratory capacity of the blood, i.e. the maximum volume of oxygen it may be made to absorb. The results obtained by both methods were found to agree. The preliminary question, whether the proportion of red corpuscles in the blood of the splenic vein is constant under varying conditions of the circulation, was decided in the negative; but it was noted that section of the splenic nerves was followed by an increase in the proportion of corpuscles and in the respiratory capacity of the blood, while stimulation of the nerves yielded negative results. Next, as regards the relation between the blood of the splenic artery and that of the vein. When the nerves were stimulated, there was hardly any difference between the two as regards the proportion of coloured corpuscles; when they were divided, the corpuscular wealth and respiratory capacity of the venous blood were always markedly augmented, though within wide limits of absolute variation. That this phenomenon is peculiar to the spleen was shown by similar experiments on blood drawn from the jugular vein, on that

returned from the submaxillary gland, etc., under varying conditions of vaso-motor paralysis and stimulation. It was always found that the blood returning from the tissues and organs whose vaso-motor supply had been cut off contained fewer red corpuscles and had a lower respiratory capacity than that which was conveyed to them by the arteries. Picard had already demonstrated (*ACADEMY*, January 10) that the spleen normally contains more iron than the blood. After section of the splenic nerves the proportion of iron in the gland sinks, and may even fall to an equality with that in the blood. Thus, instead of .24 gramme per 100 cubic centimètres, it was found to contain .15, .008, .053 gramme.

Tarchanoff and Swaen (*Comptes Rendus*, January 11, 1875) compare the number of leucocytes in the blood of the splenic vein with that in the blood of the splenic artery, employing the method of numeration devised by Malassez. They conclude: (1) that there exists no constant ratio between the proportion of leucocytes in the arterial and that in the venous blood of the body generally. The blood in the right side of the heart, however, always contains a smaller proportion than that in the left side; this is explained by the dilution of the systemic venous blood with lymph, just before entrance into the heart, and by the concentration of that in the left ventricle, owing to pulmonary exhalation; (2) that in opposition to the statements of Funke, Vierordt, and others, the proportion of leucocytes in the blood of the splenic vein is not greater than in that of the splenic artery. The less the condition of the spleen deviates from its normal standard, the more nearly alike are its arterial and venous blood in this respect; (3) that when the spleen is engorged, owing to section of its nerves, the proportion of leucocytes in the blood of its vein is always diminished.

The Acid of the Gastric Juice.—Whether the acidity of the gastric juice be due to lactic or hydrochloric acid, is still an open question. The former view rests on the authority of Prout, Graham, Schmidt, and others, while the latter is maintained by Bernard. Rabuteau has investigated the point afresh, employing a new method (*Comptes Rendus*, January 4, 1875). He obtains the juice from the stomach of a dog which has been allowed to fast for twenty-four hours, and has then been fed on bits of tendon. To the liquid, after filtration, pure quinia is added so long as it will dissolve. It is then dried *in vacuo*, and the residue treated, first with amylic alcohol, then with chloroform or benzene; the latter agents being able to dissolve many salts of quinia, while refusing to take up the mineral chlorides. On evaporation, the solvent leaves a pure hydrochlorate of quinia. Other analyses showed the absence of any trace of lactic acid. Quantitative determinations yielded 2.5 parts of hydrochloric acid in 1,000 of gastric juice.

Der Naturforscher, No. 52, cites from the *Berichte der Deutschen Chemischen Gesellschaft*, Jahrg. vii. s. 1401, experiments of Herr Fried. C. G. Müller, showing that gas diffusion can take place through the walls of soap bubbles. He employed a glass tube bent at a right angle and furnished with a small rim to give the bubble a better hold. He blew the bubble with air from the mouth through an india-rubber tube, which he closed when it was finished. The tube conveying the bubble was then placed under a jar containing hydrogen, and removed after thirty seconds, when it was found to explode with a yellow light on exposure to a flame.

A CURIOUS action of lightning on a gutta percha-and-wool-covered wire belonging to the clock of St. Martin's Church, Basle, is quoted by *Der Naturforscher*, No. 52, from *Poggendorff's Annal.*, Bd. 152, sec. 639. The date of the occurrence is not mentioned, but Herr Ed. Hagenbach reports that while the wire on one side of the clock

was uninjured, that on the other side was broken to pieces and strewn on the floor. These pieces did not at first sight seem altered, but on examination it was found that the copper had disappeared, except at a few points where small portions remained, and showed plain signs of fusion. The wool and gutta percha envelopes were not burnt; the fusion and dispersion must have been too quick for the heat to be communicated to them. A few mètres from the injured wire, both the insulated clock wires were enclosed for protection in a lead pipe. The copper in this position was not injured, but the gutta-percha envelope showed plain signs of having been melted in isolated places. The electric discharge had evidently been weaker and less rapid, so that there was time for the gutta-percha to be heated.

SOME interesting particulars of the fertilisation of *Batrachospermum*, a genus of Florideous Algae well known to microscopists, will be found in *Comptes Rendus*, December 14, 1874, in a paper by M. Sirodot. After alluding to the remarkable investigations of MM. Thuret and Bornet on many genera of the Florideae, and to the observations of M. Solms-Laubach on *Batrachospermum*, which have demonstrated the existence of antheridia and trichogynes (organs of fecundation), he mentions his own observations as supplementing theirs. They had traced the transport of the non-motile antherozoid to the trichogyne, and the union of the two at the point of contact, and it remained for him to note precisely what occurred. He objects to the term non-motile *antherozoid*, because he considers the organ to be of a different nature from a motile antherozoid, and he proposes to name it a *pollenide*, indicating its resemblance to pollen. A motile antherozoid, he says, is naked protoplasm, and fuses into the oosphere, leaving no trace of its existence, while the *pollenide* of the *batrachospermus* possesses an enveloping membrane which remains adhering to the trichogyne long after fecundation is accomplished. This fact is identical with what occurs in phanerogams when the pollen cells adhere to the stigmatic surface. Pollen cells generally emit tubular prolongations which traverse the conducting tissue, and only in exceptional cases exhibit direct fusion or soldering with the cellular tissue of the stigma. Among the Florideae this soldering is the normal action, and the emission of tubes is not entirely wanting, as the pollenide is sometimes arrested a little way off the trichogyne, and the junction then takes place through a prolongation.

M. Sirodot observes that precision would be promoted and confusion avoided if the pollen-masses of orchids and asclepiads were called *pollinies*; the copulative branchlets of Fungi *pollinodes*, and the fecundating vesicle of Florideae *pollinides*.

In many Florideae, he says, the trichogynes are such minute filaments that the whole process of impregnation cannot be seen; but in a dioicous species in his group *Helminthosa*, dedicated to Bory under the name *Batrachospermum Boryanum*, all the phenomena may be observed, and the contents of the pollenide may be seen to advance slowly into the protoplasm of the trichogyne through the opening made by the absorption of the membranes of the two organs at their point of union. A power of 700 or 800 linear magnification is required. "The primitive cellule of the cystocarp," he states, "is not formed till after the mixture of the two protoplasts. Before fecundation the female organ is a single terminal cellule, divided by a constriction into two very unequal compartments; the basilar are very small and destined to the formation of the first cystocarpian cell; the other, terminal and much larger, being the trichogyne. Before the mingling of the two protoplasts, may be noticed: (1) free communication between the two compartments by a narrow canal; (2) an arrest of the extension of the cystocarpian compartment during the enlargement of the trichogyne. If fecundation does not occur, the trichogyne may elongate itself to twice its volume without

the basilar compartment sharing in its growth; but after fecundation and the fusion of the protoplasm, the trichogyne becomes inert, while the cystocarpian compartment enters upon a rapid growth, and in the meanwhile the protoplasm occupying the narrow channel of communication thickens, solidifies, and closes the way. Thus the first cystocarpian cell is definitively constituted as a closed utricle. The fascicular ramification of the cystocarp occurs by multiple budding on the primary cell."

THE *Rheinisches Museum* (vol. xxx. part 1) contains a great deal of critical matter contributed by eminent hands. Jeep has an important article on the MSS. of Claudian, excepting the Rape of Proserpine, which he has previously treated. A long article by Bücheler "De Bucolicorum Graecorum aliquot Carminibus," contains a number of emendations, among the more successful of which may be mentioned *μύρατο σιμνήν* for *μύρατο ὄλκων* in the Epitaphium of Bion: the best MSS. giving, for *ἐλφιν, σε πριν* or *γε πριν*. E. Hiller contributes an interesting article on the *ἱλαροτραγῳδία* and some cognate forms of Greek poetry. Among H. A. Koch's emendations on Seneca's dialogues we may notice "*etiamsi molae nos pudebit et pultis*" for "*etiamsi mulos pudebit ei plus*" in *De Tranquillitate Animi* ix. 2. In a paper entitled, "Adversarien über Madvig's Adversarien," Lehrs exposes with much acrimony, but not without justice, the great Danish scholar's shortcomings in dealing with the Greek and Latin poets. Students of history will read with much interest a paper by Droysen on the mistakes made by Polybius in his description of Carthage.

In the *Neue Jahrbücher für Philologie und Pädagogik* (Fleckeisen & Masius), vol. cxii. part 1, G. Gilbert has an article on the constitution of the Attic *naulerariæ*, maintaining that they did not exist before Solon, and endeavouring (after Kirchhoff) to discredit Herodotus' account of the Cylonian conspiracy, which he considers to have been influenced by accounts furnished by the Alcmaeonids and written in their interest. From this point onwards the argument is based on fragments of Aristotle's *πολιτεία*, preserved by Photius. F. Duhn contributes a long and interesting account, based on a minute examination of the fragments of Hyperides, of the trial of Demosthenes on the matter of Harpalus. A favourable review of the first part of Hartel's *Homerische Studien*, by Gustav Meyer, deserves the attention of Homeric students. In the educational part of the journal the most important contribution is an article by Hess, "Ueber das griechische Extemporale in Gymnasialprima," which is interesting as giving an insight, not merely into the details of educational questions now being discussed in Germany, but also as throwing light on the general aspect of the conflict between the grammatical and historical methods of teaching classics in schools.

MEETINGS OF SOCIETIES.

MUSICAL ASSOCIATION (Monday, February 1).

THE fourth meeting of the Musical Association was held on February 1, at the Beethoven Rooms, Harley Street. Mr. Hullah occupied the Chair. After the business meeting, at which a considerable number of new members were elected, Mr. C. E. Stephens read a paper on "The Fallacies of Dr. Day's Theory of Harmony, with a brief outline of the Elements of a New System." The audience was numerous, and included a considerable number of ladies.

Mr. Stephens remarked that no work exists which traces the material of harmony to its source in natural laws in a manner commanding general assent. (This position may be doubted in view of the work of Helmholtz.) Some allusions were made to the history of the subject, and it was remarked that Dr. Day's opinions had at one time exercised great influence, enough of which survives

in some modern books on harmony to make the subject well worth consideration.

Dr. Day's position was, that any note used in a key must have an existence relatively to that key, must be derived from a root in that key, and must belong to one of three series of harmonics arising from tonic, supertonic, and dominant. Chromatic notes said to be in the key are thus derived as well as ordinary scales.

First objection: Non-coincidence of pitch. The notes thus represented differ considerably in pitch from the harmonics assigned them by Dr. Day. The only derivation that is strictly correct in pitch is the major ninth, which is accurately given by the ninth harmonic, but two octaves too high. The derivations of the Italian, French, and German sixths from the harmonic series are all false in pitch; also the derivation of the perfect fourth to the key note from the seventh harmonic of the dominant. (The fourth thus obtained is rather more than a comma flat.)

Second objection: High order of harmonics. To procure even these approximate representations, it was necessary to take harmonics of so high orders that they have no real existence in musical notes. Thus the twenty-fifth harmonic is employed. (This note is four octaves, a fifth, and three commas nearly above the fundamental; a similar derivation of the minor third from the nineteenth harmonic is given in a well-known modern work on Harmony).

Dr. Day's treatment of the minor mode is less developed. He says, "The minor third on the tonic is a purely arbitrary interval;" and proscribes the use of the minor common chord of the third of the key. To refute this position, Mr. Stephens performed examples from well-known music (Handel, Mendelssohn, Goss), in which this chord is used with good effect in emphasised positions. A proscription of transient modulation over dominant or tonic pedal was similarly refuted.

Mr. Stephens then indicated the outlines of his system, which he considers to be new. The only harmonics which he admits are the twelfth and tierce, which determine the consonances of the fifth and third. Some very remarkable combinations were given, which were stated to arise from the new system.

At the conclusion of the above paper, Mr. A. J. Ellis, F.R.S., addressed the association. He pointed out that the view of Mr. Stephens appeared to amount to derivation from octaves, fifths and thirds, and contended for the admission of the harmonic seventh as an additional elementary interval. His remarks were illustrated by the performance of various chords in just intonation on a little-known instrument called Wheatstone's symphonium. The further discussion of this important paper was adjourned till March 1, at 4 P.M.

INSTITUTION OF CIVIL ENGINEERS (Tuesday, February 2).

T. E. HARRISON, Esq., President, in the Chair. Professor Prestwich read a paper "On the Origin of the Chesil Bank, and on the Relation of the existing Beaches to past Geological Changes, independent of the present Coast Action." In tracing the origin of the pebbles in the Chesil Bank, Sir John Coope concluded that they must have been derived from the coast between Lyme Regis and Budleigh Salterton, and that the shingle had been propelled eastwards along the coast by the action of wind-waves. Against this view may be urged the strong objection that the largest pebbles occur at the Portland end of the bank, the size gradually diminishing towards Abbotsbury; that is to say, the largest pebbles have been carried farthest from their parent rocks. Professor Prestwich has recently found that an old raised beach on Portland Bill, standing from twenty-one to forty-seven feet above the present beach, contains all the materials found in the Chesil Bank; and he concludes

that the action of the Race off Portland, combined with the tidal-waves, must have driven the shingle of the old beach on to the south end of the Chesil Bank, whence it was driven northward to Abbotsbury and Burton by the action of the wind-waves, which have their greatest force from the S.S.W. Professor Prestwich believes that the greater part of the shingle of the south coast generally has been derived not directly from the present cliffs, but indirectly from beds of quaternary gravel, and from the wreck of the raised beach. The Fleet, like Weymouth Beach water, appears to have been formed by the growth of the Chesil Bank on the one hand, and of Ringstead and Weymouth Beach on the other, gradually damming in portions of the old coastline.

SOCIETY OF BIBLICAL ARCHAEOLOGY (Tuesday, February 2).

S. BIRCH, LL.D., President, in the Chair. The following papers were read:—

1. "On Human Sacrifice among the Babylonians," by the Rev. A. H. Sayce, M.A. In this interesting paper the author derived direct evidence of the prevalence of the awful custom of human sacrifice among the ancient Chaldeans from the translation of two Accadian tablets, one of which declared the immolation to have a vicarious efficacy, especially in the case of children who offered as atonements for the sins of their parents. There was also a special name given to the act, it being called "The Sacrifice of Bel, or of righteousness," and a description of the rite forms the subject of the first tablet of the great epic cycle of mythical legends, under the head of the first month and the first sign of the zodiac. The paper concluded with a series of references to the performance of human sacrifice, derived from cuneiform authorities and the recently discovered Carthaginian inscriptions.

2. "On the Date of Christ's Nativity," by Dr. Lauth, of Munich. The learned author agrees with Mr. Bosanquet (*Trans. S. B. A.*, 1872) in assuming 3 B.C. of ordinary era as the date of the nativity; and adduces what he thinks proofs from the Roman Indiction, Egyptian Apis tablets, &c. He considers the crucifixion to have occurred on Friday, April 7; that the darkness was caused by a planet obscuring the sun, which planet has since disappeared. He assumes the three Magi to be Caspar (Thane of Sipara), Belshazzar (Ruler of Assyria), and Melchior (King of the River, Nile). Many hieroglyphic and classic writers are quoted also the circumstance that on the night of Apr. 30—May 1, the Germans have C + M + P marked on their doors; that gardeners do not like to plant out on May 12-14, the three days the cold saints. (Humboldt thinks this connects with the Mescor group passing the solar disc Reference is also made to the Egyptian sacrifice a swine; to the Massacre of the Innocents; the flight of Joseph and Mary (probably for connivance with the Galilean insurrection of Judas against Archelaus), &c.; also that the second census of Quirinius occurred when Jesus was his twelfth year.

ROYAL SOCIETY OF LITERATURE (Wednesday, February 3).

SIR S. DE COLQUHOUN, Q.C., Vice-President, in the Chair. Mr. W. de Gray Birch read a paper on "The Classification of Manuscripts, chiefly relation to the Classified Catalogue of the Brit. Museum," in which he gave interesting and minute details of the contents of that magnificent collection. The great work of forming a complete classified catalogue of the whole of the MSS. in the British Museum is now finished, and has been formally announced by Mr. Bond, the present Keeper, in the last Parliamentary Report. The Catalogue extends to more than one hundred volumes, and reflects great credit on those gentlemen who have so zealously co-operated with Bond in carrying his plan into execution.

ROYAL SOCIETY (Thursday, February 4).

THE following papers were read:—"Remarks on Professor Wyville Thomson's 'Preliminary Notes on the Nature of the Sea-bottom, procured by the soundings of H.M.S. *Challenger*,'" by Dr. Carpenter; "Report on the Cruise of H.M.S. *Challenger*, from July to November, 1874," by Professor Wyville Thomson.

SOCIETY OF ANTIQUARIES (Thursday, February 4).

A. W. FRANKS, Esq., exhibited a collection of rubbings from brasses in Berkshire, which he has presented to the Society. Many of them are extremely fine, and the rubbings were remarkably well taken. Some are very curious. Two, from Rutland Chantry in St. George's Chapel at Windsor, are in memory of William and Dorothy, children of Dr. King, Prebendary of Windsor in the beginning of the seventeenth century, and represent the children lying in their beds, with curtains hanging from the top, which could be drawn so as completely to cover the sleepers. A similar design occurs at Hurst, where a lady named Alice Harrison is represented in a large four-post bedstead. In Winkfield Church is another pictorial brass, showing Thomas Mount, yeoman of the guard, who died in 1630, distributing loaves of bread to the poor. His dress is nearly identical with that worn by the beef-eaters at the Tower before the change made in their uniform a few years ago. Many of the specimens, being from the churches in the neighbourhood of Windsor, are the memorials of persons connected with the Court, and are useful examples of the costume, both lay and clerical, of the fourteenth and later centuries.

LINNEAN SOCIETY (Thursday, February 4).

DR. G. J. ALLMAN, F.R.S., President, in the Chair. A letter was read addressed to Dr. Hooker by Mr. J. Gammie, on the peculiar appendage to the spadix of *Arisaena speciosum* (belonging to the Aroideae). It had been conjectured that the appendage was in some way a contrivance for the cross-fertilisation of the plant, but the author had not been able to detect that it was ever visited by insects. A paper was read by H. N. Moseley, on the Plants and Insects of Kerguelen's Land. It has been stated that the insects of these islands were entirely apterous; but, in addition to several wingless insects, Mr. Moseley had found one winged gnat. One of the insects was found in great quantities on the *Pringlea*, but not on the inflorescence. The next paper was by the Rev. G. Henslow, on the Origin and prevailing Systems of Phyllotaxis. By a very elaborate train of reasoning, the author traced the origin of all other modes of phyllotaxis to modifications of the decussate as the simplest. In the discussion which followed, in which Mr. Hiern, Professor Dyer, Dr. Masters, and Mr. A. W. Bennett took part, a doubt was suggested as to the soundness of Mr. Henslow's conclusions, on the ground that the decussate arrangement of leaves is found only in some of the higher groups of flowering plants, and that the original or primitive mode must rather be looked for among the arrangements met with in some of the lower orders of plants, as the distichous in the Muscineae.

PHILOLOGICAL SOCIETY (Friday, February 5).

REV. RICHARD MORRIS, LL.D., President, in the Chair. A paper on "English Rhythm" was read by Professor J. B. Mayor. He began by controverting Mr. A. J. Ellis's views in regard to the use of classical terms (iambic, trochaic, &c.), and also to the practice of routine scansion, defending this latter as the natural mode of reciting poetry, and also as the necessary basis of scientific investigation. Confining his attention to the heroic metre, Professor Mayor pointed out the different modes of varying the typical line, and discussed the limit

of variation in respect to the use of trisyllabic feet, and the number and position of the accented syllables. The practice of Shakspeare was afterwards illustrated at considerable length by quotations from *Macbeth*, under the following heads:—

A. Variation in number of syllables (I.) by defect, (II.) by excess.

I. Fragmentary (1) or defective lines (2).

- (1) a. in short dialogue.
- b. at the beginning, middle, and end of longer speeches.

- (2) Explained by difference of pronunciation (a), by pause (b), by compensative lengthening of another syllable (c).

II. Superfluous syllables outside the foot (1), within the foot (2).

- (1) a. feminine ending of line (a), of hemistich (b).

- (2) a. *evanescent* by elision (a), slurring (b).
- b. *distinct*, constituting trisyllabic feet (c), Alexandrines, apparent or real (d).

B. Variation of accent, by excess (spondee), defect (pyrrhic), inversion (trochee).

An interesting discussion followed, in which Mr. Furnivall, Mr. Nicol and others took part.

FINE ART.

WE have received *L'Eau-forte en 1875*—a portfolio of many etchings, published by Cadart, with introduction by M. Philippe Burty. M. Burty, who is well known to readers of the ACADEMY, can only be consoled with for having good-naturedly furnished the text to a publication so disappointing as the present one. There are forty examples: all of them original: that is, they include none of the admirable copies made, say by Rajon, from Meissonier or De Hooghe, or by Flameng from Rembrandt. It is a truism to say that the value of originality depends wholly on its quality; yet this requires to be said in presence of such originality as is before us, and in proof of it we need only ask the reader to compare Gaucherel's "original" *Venise* in this collection with his reproduction of one of Ziem's Venetian scenes to be found in the illustrated catalogue of the great Wilson collection, or with his delightful transcript from Mr. Inchbold's river-side drawing in the December *Portfolio*. His copy of Ziem, his copy of Inchbold, has some definite value and charm. His original is flat and colourless; yet it is by no means the worst in the volume. That painters, many of whom are seemingly just beginning to etch, should contribute bad etchings—beneath whose badness hardly a trace of latent or inarticulate artistic quality can be discovered—is matter for dissatisfaction, perhaps, but hardly for surprise. But it is matter of surprise to find that the contributions of good etchers, like Braque-mond and Lalanne, should be of the sort which we see here. Braque-mond sends a dry, hard portrait of Legros; Lalanne has chosen a subject not likely to inspire him, for he needs must busy himself with themes of grace, and here, in this Breton Street (*La Grande Rue, Morlaix*) he can only discover that which is curious, or roughly picturesque. Monzie, an imitator of Meissonier, has a study of an *Amateur de Tableaux*, not wanting in character, nor in the lesser merit of a certain seductive finish; but by the execution of the amateur's right hand the whole work stands condemned. Lalauze contributes a version of a scene among the most famous of Molière's—the moment when Tartuffe, righteously grieved by the day's fashions, appeals to Dorine with—

"Couvrez ce sein que je ne saurais voir."

One finds no fault with accessories and costume, but the persons of the drama—where, indeed, are they? M. Groseilliez, in his *Matinée de Printemps*, has taken a fairly accurate plan of the disposition

of some trees and meadows that lay out before him, but his etching is as void of any true realism as it is void of sentiment. The best thing here is Laguillermie's memorandum of his picture in last season's Salon—a Breton girl winnowing black wheat by the sea. This is graceful in sentiment, and true in drawing and tone. There is something to praise in Lhermitte's *Intérieur de Moulin, à Kersaint, Finistère*; and a better known painter of Breton subjects than Lhermitte—figures of reverie, fisher folk working or watching by the shore of the great western sea—we mean M. Feyen-Perrin—sends something which must be classed among works of serious art. This is *Les Deux Frères*—a man bending over a coffin, in passionate despair—which is good indeed and free from a perilous commonplace—homely and serious instead. But its merit is in sentiment and composition, for as etching it is too full of abrupt and sudden and uncalled-for passages from high light to shade. Legros is generally impressed with some spiritual beauty or exaltation that lurks behind physical ugliness and misery, and his *Mendiants Anglais* may worthily join the company which, in Rembrandt's pitying fashion, he makes defile before us—he the self-chosen chronicler of dark days and lonely lives.

FREDERICK WEDMORE.

An Introduction to Ancient and Modern Architecture, Sculpture, Painting and Music. By N. d'Anvers. (London: Asher & Co.) The value of art training, not only as a branch of technical education, but also as a means of culture, is becoming every day better appreciated. Art schools in connexion with South Kensington are springing up all over England, and not the least of the advantages that the School Board proposes to confer on the rising generation is instruction in drawing. Even the poorest child, therefore, who evinces artistic capacity is pretty sure to be able to obtain some sort of art teaching whereby his capacity may be developed. But with all this progress in the practical knowledge of art, it is astonishing to find how few persons, even of the educated classes, have any real appreciation of artistic excellence, or are capable of enjoying it. In ancient Greece almost every citizen was able to criticise the merits of the noble works of art that adorned his capital, and was educated and elevated to a great extent by them; in mediæval Italy also, in Florence especially, a lively interest was felt by the people in the works of their artists; but in walking through a picture gallery or museum at the present day, one can scarcely fail to notice the indifference with which the greater number of the visitors regard the works of art presented to their notice. It is evident from their weary looks and inane remarks that they fail to derive either pleasure or instruction from the aesthetic treat provided for them. This indifference and lack of appreciation are mainly due to want of knowledge. Directly even a little knowledge is gained, an interest is created, and further teaching by the works themselves becomes possible.

It is just this preliminary knowledge that the elementary History of Art before us aims at supplying. "It is not," it is owned, "within the power of this, or any book, to give an intimate knowledge and keen appreciation of art," but no better beginning can perhaps be made in the study of any one of the fine arts than its history.

And yet art history, which thus forms to a great extent the basis of art culture, is about the only history left untaught in our schools. It is not so in Germany, for the present work is founded upon one that has been long in use in German schools,—only the German setting, so to speak, has been altered, and a special chapter added on "Art in England."

With regard to the merits of the book itself, it may be said that it is comprehensive and accurate. It aims, perhaps, at giving too much knowledge, a mistake often made in element-

any works; but the matter is well arranged, and the facts are told without any attempt to make them fit into preconceived theories. The arrangement, however, by virtue of which the chapter on Indian Architecture is placed before that on Egyptian is not to be commended, for, as dates are very sparingly used, it might lead to the supposition that the Tope of Ceylon, the first illustration in the book, was older than the pyramids of Egypt. The history of each art is continued down to the present day, and examples of its latest development pointed out. Thus, in Architecture, the Albert Memorial is referred to as "the most recent and most ornate effort of revived Gothic," and the New Zealand Chambers in Fenchurch Street, designed by Mr. Norman Shaw, as being "the very latest fashion in architecture." This is decidedly useful, for many students who are well acquainted with the early history of art are entirely ignorant of its position and development at the present day. It is scarcely fair, however, to prejudice young readers by the statement that "the circumstances of the day are not such as to lead to a strong hope that our school [the English school] will make rapid strides either in the direction of landscape or *genre* painting." This is merely the individual opinion of the author, which may or may not be true, but is certainly out of place in an elementary manual.

The addition of a chapter on the History of Music is a most unusual and, we cannot help thinking, incongruous element in a work devoted, with this exception, entirely to the arts of Design. Considering that "the exact position of Music in the scheme of the fine arts has never yet been defined," it seems unnecessary to thrust its history before art scholars.

MARY M. HEATON.

SIXTH WINTER EXHIBITION OF OLD MASTERS AT THE ROYAL ACADEMY.

(Fifth and Concluding Notice.)

WITHIN the given time and space, it would be idle for criticism to think of exhausting the contents of a gallery of the portraits of all nations, such as forms one part of this exhibition. About a portrait, though it is the simplest kind of picture, there is more to find out than about a picture of any other kind; more, obviously, than about a landscape; more, also, than about a religious or ideal piece. For the parentage and career of real men and women are more palpable and more full of particulars than the parentage and career of imaginations. Each of these splendid or faded ghosts had in life a history of its own, a name, deeds, fortunes, which are matters for positive knowledge and enquiry. Ghosts? In truth, there are men and women of whom what art can preserve among us is but the ghost. These are the really great, whom pre-eminence among their kind, and power for good or evil, have made immortal. They live in fame, which is life indeed; beside it that other life of their painted lineaments is the shadow of a shade. But more there are, who owe it to art's impartiality if they survive at all. They are forgotten; but their painted lineaments remain. What they were and did has become a shadow; what they looked is the only substance. And so, for one picture that is a great man's ghost, a hundred other men seem nothing now, except the ghosts of pictures; their likenesses are the realities, themselves the phantoms.

Neither the easy sort of enquiry about the famous names, nor the more difficult identification of the obscure, can be allowed much place in what is to be said to-day of the portraits in the Exhibition. Both studies might be interesting; but they would never end. I shall simply, as before, look for those larger matters of comparative criticism which seem suggested by the works of the different schools as they elbow or confront each other upon the walls. It was not until the fifteenth century that portrait-painting came to perfection. The early Italian

school, Giotto and his followers, had kept the human countenance at a certain degree of abstraction. In the fifteenth century art grappled with physiognomy and mastered it. The human countenance, as it existed among the impressive and multifarious individualities of Italian republican life, got realised in all shades and shifts of character, and that without loss of nobleness or style. The attendant groups in a Scripture scene by Ghirlandaio are so many assemblages of consummate Florentine portraits. And since then portrait-painting has been well done by all schools that have done anything well at all. Not less consummate than the Florentine work, however unlike, are the portraits poured forth a hundred years ago from certain famous studios in Leicester Square, Cavendish Square, and Pall Mall,—forlorn at the same hour as were our attempts at Scripture and imagination.
